

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

USEFUL KNOWLEDGE.

D I O

D I O

DIONYSIUS THE YOUNGER, son of Dionysius the Elder, succeeded him as tyrant of Syracuse, being acknowledged as such by the people. His father had left the state in a prosperous condition; but young Dionysius had neither his abilities nor his prudence and experience. He followed at first the advice of Dion, who, although a republican in principle, had remained faithful to his father, and who now endeavoured to direct the inexperienced son for the good of his country. For this purpose Dion invited his friend Plato to Syracuse about 364 B.C. Dionysius received the philosopher with great respect, and in deference to his advice reformed for awhile his loose habits and the manners of his court. But a faction, led by Philistus, who had always been a supporter of the tyranny of the elder Dionysius, succeeded in prejudicing his son against both Dion and Plato. Dion was exiled under pretence that he had written privately to the senate of Carthage for the purpose of concluding a peace. Plato urgently demanded of Dionysius the recall of Dion, and not being able to obtain it, he left Syracuse, after which Dionysius gave himself up to debauchery without restraint. Aristippus, who was then at his court, was the kind of philosopher best suited to the taste of Dionysius. Dion meantime was travelling through Greece, where his character gained him numerous friends. Dionysius, moved by jealousy, confiscated his property, and obliged his wife to marry another. Upon this Dion collected a small force at Zacynthus, with which he sailed for Sicily, and entered Syracuse without resistance. Dionysius retired to the citadel in the Ortygia, and after some resistance, in which old Philistus, his best supporter, was taken prisoner and put to death, he quitted Syracuse by sea, and retired to Locri, the country of his mother, where he had connexions and friends. His partisans, however, retained possession of Ortygia, and a faction having risen in the town, headed by Heraclides, a demagogue, who proposed an equal distribution of property, which Dion resisted, the latter was deprived of his command, and would have been killed by the excited populace, had not his soldiers escorted him safely to Leontini. In the midst of the confusion, a successful sortie made by the soldiers of Dionysius, who plundered and burnt part of the city, recalled the Syracusans to their senses, and messengers were dispatched after Dion, requesting him to return. Dion obeyed the call, repulsed the enemy, and soon after took the citadel. But the faction of Heraclides conspired against Dion, and had him treacherously murdered, 354 B.C.

Several tyrants succeeded each other in Syracuse, until Dionysius himself came and retook it about 346. Dionysius, however, instead of improving by his ten years' exile, had grown worse; having usurped the supreme power in Locri, he had committed many atrocities, had put to death several citizens, and abused their wives and daughters. (Justinus, *Ælianus*.) Upon his return to Syracuse, his cruelty and profligacy drove away a great number of people, who emigrated to various parts of Italy and Greece, whilst others joined Iketas, tyrant of Leontini, and a former friend

of Dion. The latter sent messengers to Corinth to request assistance against Dionysius. The Corinthians appointed as leader of the expedition Timoleon, who had already figured in the affairs of his own country as a determined opponent of tyranny. Timoleon landed in Sicily 344 B.C., notwithstanding the opposition of the Carthaginians and Iketas, who acted a perfidious part on this occasion; he entered Syracuse, and soon after obliged Dionysius to surrender. Dionysius was sent to Corinth, where he spent the remainder of his life in the company of actors and low women; some say that at one time he kept a school. Justin (xxi. 5) says that he purposely affected low habits in order to disarm revenge, and that being despised, he might no longer be feared or hated for his former tyranny. Several repartees are related of him in answer to those who taunted him upon his altered fortunes which are not destitute of wit or wisdom. (Plutarch, *Dion.*; Diodorus, xvi.)

DIONYSIUS, the son of Alexander, an historian and critic, born at Halicarnassus in the first century B.C. We know nothing of his history beyond what he has told us of himself. He states (*Antiq.*, p. 20-24) that he came to Italy at the termination of the civil war between Augustus and Antony (B.C. 29), and that he spent the following two-and-twenty years at Rome in learning the Latin language and in collecting materials for his history. (Phot. *Biblioth.*, cod. lxxxvi.) He also says (*Antiq.*, p. 1725) that he lived in the time of the great civil war. The principal work of Dionysius is his *Roman Antiquities*, which commenced with the early history of the people of Italy, and terminated with the beginning of the first Punic war, B.C. 265. (*Antiq.* i. p. 22.) It originally consisted of twenty books, of which the first ten remain entire. The eleventh breaks off in the year 312 B.C., but several fragments of the latter half of the history are preserved in the collection of Constantine Porphyrogenetus, and to these a valuable addition was made in 1816 by Mai, from an old M.S. Besides, the first three books of Appian were founded entirely upon Dionysius; and Plutarch's biography of Camillus must also be considered as a compilation mostly taken from the Roman Antiquities, so that perhaps upon the whole we have not lost much of this work. With regard to the trustworthiness and general value of Dionysius's history, considerable doubts may be justly entertained; for though he has evidently written with much greater care than Livy, and has studied Cato and the old annalists more diligently than his Roman contemporary, yet he wrote with an object which at once invalidates his claim to be considered a veracious and impartial historian. Dionysius wrote for the Greeks; and his object was to relieve them from the mortification which they felt at being conquered by a race of barbarians, as they considered the Romans to be; and this he endeavoured to effect by twisting and forging testimonies and botching up the old legends, so as to make out a *prima facie* proof of the Greek origin of the city of Rome, and he inserts arbitrarily a great number of set speeches, evidently composed for the same purpose. He

indulges in a minuteness of detail which, though it might be some proof of veracity in a contemporary history, is a palpable indication of want of faith in the case of an ancient history so obscure and uncertain as that of Rome. With all his study and research, Dionysius was so imperfectly acquainted with the Roman constitution that he often misrepresents the plainest statements about it. (Niebuhr, *Hist. Rome*, vol. ii. p. 13, Engl. tr.) For instance, he imagines that the patricians had all the influence in the centuries, and that the plebeians and equites had nothing to do with the first class. (*Antiq.* vii. 82-87, x. 17. See Niebuhr, *Hist. Rome*, ii. p. 178, Engl. tr.) He thought the original constitution of Rome was a monarchical democracy, and calls the curies the *demus* (δημος). He believed when he wrote his second book that the decrees of the people were enacted by the curies and confirmed by the senate (*Antiq.* ii. 14), and not, as he afterwards discovered, the converse. (*Antiq.* vii. 38.) In a word, though the critical historian may be able to extract much that is of great importance for the early history of Rome from the garbled narrative and the dull trifling of Dionysius, he cannot be regarded as a meritorious writer, or recommended to the student of ancient history as a faithful guide. Dionysius also wrote a treatise on rhetoric; criticisms on the style of Thucydides, Lysias, Isocrates, Isæus, Dinarchus, Plato, and Demosthenes; a treatise on the arrangement of words, and some other short essays. His critical works are much more valuable than his history, and are indeed written with considerable power. The criticism on Dinarchus [DINARCHUS] displays good sense and judgment, and shows the great pains which the author took to separate the genuine writings of the Attic orators from the fabrications which passed under their name. The best editions of Dionysius are those of Hudson, *Oxon.*, 1704, 2 vols., in folio; and by Reiske, *Lips.*, 1774-1777, 6 vols., in 8vo. Mai's fragments were first published at Milan in 1816, and reprinted the following year at Frankfurt. They also appear in the second volume of Mai's *Nova Collectio*, Rome, 1827. His rhetoric has been published separately by Schott, *Lips.*, 1804, 8vo.; and his remarks on Thucydides by Krüger, *Hal. Sax.*, 1823, 8vo. There is a German translation of the *Roman Antiquities* by J. Lr. Benzler, Lemgo, 1771-1772, 2 vols., 8vo. The only English translation of the *Antiquities* is the following: 'The Antiquities of Dionysius Halicarnassensis, translated into English, with notes and dissertations, by Edward Spelman, Esq.,' 2 vols., 4to., London, 1748.

DIONYSIUS of Byzantium lived before the year A.D. 196. His voyage (Ἀνάπλους) in the Thracian Bosphorus was extant in the 16th century, for Gyllius, who died in 1555, has given extracts in Latin from it in his work on the Thracian Bosphorus. A single fragment from this work is printed in Ducange's 'Constantinopolis Christiana,' and in Hudson's *Minor Greek Geographers*. Perhaps there is some confusion between this Dionysius and the author of the 'Periegesis,' whom Suidas (Διονύσιος) calls a Corinthian.

DIONYSIUS PERIEGETES, the author of a Greek poem in 1186 hexameter verses, intitled Τῆς Οἰκουμένης Περιήγησις, or 'a description of the habitable world.' It is not known where Dionysius was born nor where he lived. Perhaps the most probable opinion is, that he was a native of Byzantium and belonged to the latter part of the third or the beginning of the fourth century A.D. As a poem the *Periegesis* is of little value, and as a geographical work, not worth the trouble of reading. The commentary of Eustathius on the *Periegesis* possesses some value for the miscellaneous information which is scattered through it. There are two Latin translations of this poem, one by Rufus Festus Avienus, and the other by Priscianus. There are numerous editions of Dionysius. The last and best edition of the *Periegesis* is by G. Bernhardt, Leipzig, 1828, 8vo., in the first volume of his 'Geographi Græci Minores.'

DIOPHANTUS, a native of Alexandria, the exact date of whose birth is unknown, some authors asserting that he lived in the reign of Augustus, whilst others place him under Nero, or even the Antonines. The fact is that we do not know when he lived. He lived however, as is well ascertained, to eighty-four years of age.

Diophantus left behind him thirteen books of Arithmetical Questions, of which however only six are extant; but from their distinct and peculiar character, in comparison with all the other writings of the Greek mathematicians,

these books have given rise to much discussion. It is however scarcely to be conceived that whilst the cumbrous machinery of common language constituted the sole instrument of investigation, the very curious conclusions which we find in this work could have resulted from the researches of one single mind. To suppose that Diophantus was the inventor of the analysis which bears his name, is so contrary to all analogy with experience and the history of mental phenomena, as to be utterly impossible to admit. Still, if we inquire into the history of this branch of analysis, and ask who were the predecessors of Diophantus, or whether they were Greeks or Hindus, no satisfactory answer can be given.

Diophantus also wrote a book on Polygon Numbers (περί πολυγώνων ἀριθμῶν). Holzmann published at Basle, in 1575, folio, a Latin translation of both the works of Diophantus. The first Greek edition was by Meziriac, Paris, 1621, folio: an improved edition of Meziriac's edition was published by S. de Fermat, Toulouse, 1670, folio. A valuable translation of the Arithmetical Questions into German was published by Otto Schulz, Berlin, 1822, 8vo.; to which is added Poselger's translation of the work on Polygon Numbers.

DIOPSIDE, a variety of PYROXENE.

DIOPSIDA, a genus of Dipterous Insects of the family Sepsidae. The insects of this genus are remarkable for the immense prolongation of the sides of the head. The head itself is small, and appears as if it were furnished with two long horns, each having a knob at its apex; these horn-like processes however are not analogous to the parts usually termed antennæ, but are in fact prolongations of the sides of the head, the knob at the apex of each being the eye of the insect. They vary in length according to the species. In some they are almost equal to the whole length of the insect, whereas in others they are only about half that length. The antennæ are situated close to the eyes, and are three-jointed: the basal joint is the smallest and is very short; the terminal joint is the largest, of a globular form (or nearly so), and furnished towards the apex with a simple seta; there is also a short seta on the peduncle or eye-stalk, situated about midway between the base and the apex of that process, and on the anterior part. The thorax is somewhat attenuated anteriorly, but approaches to a spherical form, and is generally furnished with two spines on each side; the scutellum is also furnished with two spines. The body is more or less elongated, sometimes nearly cylindrical, but generally increases in diameter towards the apex. The legs are tolerably long—the anterior femora are generally thick, and furnished beneath with minute denticulations, and the four posterior femora are often furnished with a spine at their apex.

For a detailed account of these curious insects we refer our readers to Mr. Westwood's excellent paper in the seventeenth volume of the 'Transactions of the Linnean Society,' in which twenty species are described.

Diopsis Sykesii, G. R. Gray.
a denotes the natural size.

The illustration is copied from one of that gentleman's figures, and represents the *Diopsis Sykesii*, one of the largest species of the genus, and which has been selected as possessing the longest eye-stalks; these processes in this insect are of a pitchy red colour, and the body is of the same tint. The head and thorax are black and the wings are clouded with brown.

But little is known of the habits of these insects. Lieut.-Colonel W. H. Sykes, who collected great numbers of the above species during his residence in India, furnished Mr. Westwood with the following notice respecting their habitat and habits:—

'Habitat. The hill fort of Hurrechunderghur, in the

western ghauts of the Deccan, at an elevation of 3900 feet above the level of the sea, $19^{\circ} 23'$ N. lat., $73^{\circ} 40'$ E. long.

This insect affects chasms or ravines in the lofty woods which encircle the mountain in belts. In various places, where the sunbeams occasionally pierce the woods and fall upon isolated or salient rocks in the above localities, they are seen in myriads, either poisoning themselves in the rays, or reposing on the spots on which the rays fall.

In addition to this notice we may add that all the known species are from the tropical parts of the Old World.

DIOPHASE or *emerald copper*, a crystallized silicate of copper, the primary form of which is a rhomboid; its colour varies from emerald to blackish green; its lustre is vitreous; it is translucent, and sometimes transparent; it is sufficiently hard to scratch glass, though but feebly; it is brittle; specific gravity 3.278 ; the streak is green; fracture uneven; and cross fracture flat conchoidal. It is found in Siberia and the Bannat; and, according to Lowitz, it consists of silica 33, oxide of copper 55, water 12.

DIOPTRICS. [OPTICS; REFRACTION.]

DIORA'MA, from the Greek word *διωρην*, to see through, a mode of painting and scenic exhibition invented of late years by two French artists, Daguerre and Bouton, which, although it does not possess some of the advantages of the panorama, produces a far greater degree of optical illusion. It has also one advantage over the panorama, in being equally suitable for architectural and interior views as for landscape; may even more so, because the positive degree of light is more natural, and the relief of the objects becomes more deceptive. The peculiar and almost magical effect of the diorama arises, in a considerable measure, from the contrivance employed in exhibiting the painting, which is viewed through a large aperture or proscenium. Beyond this opening the picture is placed at such distance that the light is thrown upon it, at a proper angle, from the roof, which is glazed with ground glass, and cannot be seen by the spectator. Besides the light being thus concentrated upon the picture, the effect is materially increased by the spectator being in comparative darkness, receiving no other light than what is reflected from the surface of the painting itself. Another circumstance greatly favouring illusion is the intervening distance; and also the circumstance that the sides of the proscenium or opening are continued inwards towards the picture, so as to screen its extremities, and at the same time assist in confining the light to the scene itself. The contrast thus occasioned, and the exclusion of all other objects of vision save those represented in the painting, so that the eye has no immediate standard of comparison between them and real ones, give to this species of exhibition such extraordinary force that a very moderate degree of light will suffice to show the painting. Hence the light may be diminished or increased at pleasure, and that either gradually or suddenly, so as to represent the change from ordinary daylight to sunshine, and from sunshine to cloudy weather, or to the obscurity of twilight; also the difference of atmospheric tone attending them: all which variations give to the diorama a character of nature and reality beyond that of any other mode of painting. These transitions, in regard to light and atmospheric effects, are produced by means of different folds or shutters attached to the glazed ceiling, which are so contrived that they may be immediately opened or closed to any extent, thereby increasing or diminishing the light just as required, and otherwise modifying it. Further than this, some parts of the painting itself are transparent, and on them the light can occasionally be admitted from behind, thereby producing a brilliancy far exceeding that of the highest lights of a picture upon an opaque ground, which can be made to appear vivid and sparkling only by contrast, not by any positive increase of light on those parts of the surface. Here, on the contrary, such augmented light is admitted *through* it, in addition to that which illuminates the picture generally, an artifice which secures the advantages of painting in transparency without its defects; the objects looking more solid, and the effect being altogether more natural than when the whole of the light passes through the picture. The combination of transparent, semi-transparent, and opaque colouring, still further assisted by the power of varying both the effects and the degree of light and shade, renders the diorama the most perfect scenic representation of nature, and adapts it peculiarly for moonlight subjects, or for showing such 'accidents' in landscape as sudden gleams of sunshine and their disappearance. It is also unrivalled for showing architec-

ture, particularly interiors, as powerful relief may be obtained without that exaggeration in the shadows which is almost inevitable in every other mode of painting.

Although hitherto employed only for purposes of public exhibition, the diorama might undoubtedly be turned to account for those of embellishment likewise in corridors and other places of that kind, where light can be obtained only from one extremity. For it should be observed that the principle is totally independent of the contrivance adopted for exhibiting two pictures; although this latter in itself enhances the attraction to the public. This may be understood by briefly describing the building erected for the purpose in the Regent's Park, London, after the plans of Messrs. Morgan and Pugin, and first opened in the autumn of 1823.

The spectatory or saloon for the visitors is a rotunda 40 feet in diameter, with a single opening or proscenium about 20 feet wide; and placed within another rotunda having two openings communicating with the picture-rooms, each of which contains a view. When a change of scene takes place the inner rotunda is turned by means of machinery beneath the floor, till the proscenium is gently shifted from the opening into one picture-room to that of the other, the two being quite contiguous. At the next change it is shifted back again, so that the whole space passed over backwards and forwards is about one-third of the entire circumference, or double that portion of the circle forming the proscenium. The diorama at Berlin, executed by Carl Gropius, an eminent scene-painter, is somewhat on the same plan, yet with some slight differences. The peculiar mode just described, of turning the spectatory from one painting to the other, is adopted, as the scenes are much larger than the opening through which they are viewed, and require to be stretched on a framing, so that they cannot be either rolled up, or drawn aside in two halves, as is done with scenes of a theatre. Nevertheless, it would perhaps be found practicable to exhibit a succession of three or four views, in a single 'picture-room,' by making that part of the building sufficiently spacious to allow each scene to be slid backwards or forwards, so as to be entirely out of view when drawn aside.

DIOSCO'REA, the genus of plants which furnish the tropical esculents called yams. They are perennial fleshy-rooted or tuberous dicotyledonous plants, with annual twining stems, broad alternate leaves having a somewhat netted arrangement of their veins, and loose clusters of small green flowers. The corolla and the calyx taken together consist of six small equal segments, which, in the females, stand upon the top of the ovary. The male flowers have six stamens; the females three styles. The seed vessel is a thin compressed three-winged capsule, containing one or two membranous seeds.

The only general account of the species, which at all deserves to be consulted, is that of Dr. Roxburgh, who cultivated seventeen sorts in the Botanic Garden, Calcutta; others are known to botanists, but far from perfectly.

The common West India yam, which is often sold in the shops of London, is produced by *Dioscorea alata*. It is met with in the East Indies also, but only in a cultivated state. A figure of it is given in Rheede's 'Hortus Malabaricus,' vol. vii. t. 38, under the name of *katsji-kelengu*. Its tubers are oblong, brown externally, white internally, and often of great size, weighing sometimes as much as 30 lbs.; they perish after the first year, if left in the ground, having first produced the young ones that are to replace them. Besides the tubers the proper roots of all these plants are fibrous, springing from and chiefly about the union of the stems with the tubers, and spreading in every direction. The stems are furnished with four crested leafy wings, and spread to a great extent twining round trees and bushes; they often bear prickles near the ground. The first leaves that appear on the stem are alternate, the succeeding are opposite, seated on long stalks, deeply heart-shaped at the base, sharp-pointed, smooth, with from five to seven ribs. The flowers are small and green, and appear in compound panicles. The remainder of the species are very similar to this in general characters; a few short notes will sufficiently indicate their differences.

D. globosa, cultivated in Bengal under the name of *choo puree aloo*, is most esteemed of the Indian yams. Its flowers are highly fragrant; the tubers are white internally; the leaves arrow-headed.

D. rubella, the *guranya-aloo*, is another Indian sort with large tubers stained with red immediately below the cuticle;

it is much esteemed; its tubers are sometimes three feet long; its flowers are fragrant.

Another valuable kind is *D. purpurea*, called *lal-guranya-aloo* in Bengal, whose tubers are permanently stained purple throughout.

At Malacca is cultivated another purple-rooted sort, the *D. atropurpurea*, whose tubers are large and irregular, and grow so near the surface of the ground as to appear in dry weather through the cracks that they make in the soil by raising the earth over them.

Other eatable sorts are numerous, but are less valuable, and therefore not cultivated. In Otaheite the *D. bulbifera*, which bears small fleshy angular tubers along the stem in the axils of the leaves, is the favourite species.

It is not a little remarkable that while so many species are nutritious in this genus, some should be highly dangerous; but such is unquestionably the fact. *Dioscorea Dæmonum* and *triphylla*, both ternate leaved species, have dreadfully nauseous and dangerous tubers. No genus is more in want of revision than this.

DIOSCOREA/CEÆ, a natural order of endogenous plants, referred to the Retose group, and having the last genus for their type. They are particularly distinguished by the following character.

Flowers diœcious; calyx and corolla superior; stamens six; ovary three-celled, with one or two-seeded cells; style deeply trifid; fruit leafy, compressed, occasionally succulent; embryo small, near the hilum, in a large cavity of cartilaginous albumen.

All the species are twining shrubs, with alternate or spuriouly opposite leaves. They consist, with the exception of *Tamus*, or *Black Bryony*, of tropical plants, or at least of such as require a mild frostless climate. Some of them produce eatable farinaceous tubers, or yams, as the various species of *Dioscorea* and *Testudinaria*; but there is a dangerous acrid principle prevalent among them, which renders the order upon the whole suspicious. It exists in a perceptible degree in *Tamus*, and is still more manifest in the three-leaved *Dioscorea*.

1, a shoot of *Rajania cordata*; 2, a male flower; 3, a female flower; 4, a portion of a ripe fruit with the seed exposed; 5, a section of the seed.

DIOSCORIDES, PEDA'CIOUS, or PEDA'NIUS, a Greek writer on *Materia Medica*, was born at Anazarbus, in Cilicia, and flourished in the reign of Nero, as appears from the dedication of his books to *Areus Asclepiadeus*, who was a friend of the consul *Licinius* or *Lecanius Bassus*. In early life he seems to have been attached to the army; and either at that time or subsequently he travelled through Greece, Italy, Asia Minor, and some parts of Gaul, collect-

ing plants with diligence and acquainting himself with their properties, real or reputed. He also gathered together the opinions current in his day concerning the medical plants brought from countries not visited by himself, especially from India, which at that time furnished many drugs to the western markets. From such materials he compiled his celebrated work on *Materia Medica*, in five books, wherein between 500 and 600 medicinal plants are named and briefly described. He is moreover reputed the author of some additional books on therapeutics, &c.; but in the judgment of *Sprengel* the latter are spurious, and from the mixture of Latin and Greek names of plants, are probably some monkish forgery.

Few books have ever enjoyed such long and universal celebrity as the *Materia Medica* of *Dioscorides*. For sixteen centuries and more, to use the words of one of his biographers, this work was referred to as the fountain-head of all authority by everybody who studied either botany or the mere virtues of plants. Up to the commencement of the seventeenth century the whole of academical or private study in such subjects was begun and ended with the works of *Dioscorides*; and it was only when the rapidly increasing numbers of new plants and the general advance in all branches of physical knowledge compelled people to admit that the vegetable kingdom might contain more things than were dreamt of by the *Anazarbian* philosopher, that his authority ceased to be acknowledged.

This is the more surprising, considering the real nature of these famous books. The author introduced no order into the arrangement of his matter, unless by consulting a similarity of sound in the names he gave his plants. Thus, *medium* was placed with *epimedium*, *althæa* with *cannabis*, *hippophæstum* (*cnicus stellatus*) with *hippophæ*, and so on; the mere separation of aromatic and gum-bearing trees, esculents and corn-plants, hardly forms an exception to this statement. Of many of his plants no description is given, but they are merely designated by a name. In others the descriptions are comparative, contradictory, or unintelligible. He employs the same word in different senses, and evidently attached no exactness to the terms he made use of. He described the same plant twice under the same name or different names; he was often notoriously careless, and he appears to have been ready to state too much upon the authority of others. Nevertheless, his writings are extremely interesting as showing the amount of *Materia Medica* knowledge in the author's day, and his descriptions are in many cases far from bad: but we must be careful not to look upon them as evidence of the state of botany at the same period; for *Dioscorides* has no pretension to be ranked among the botanists of antiquity, considering that the writings of *Theophrastus*, four centuries earlier, show that botany had even at that time begun to be cultivated as a science distinct from the art of the herbalist.

The most celebrated MS. of *Dioscorides* is one at Vienna, illuminated with rude figures. It was sent by *Busbequius*, the Austrian Ambassador at Constantinople, to *Mathiolus*, who quotes it under the name of the *Cantacuzene Codex*, and is believed to have been written in the sixth century. Copies of some of the figures were inserted by *Dodoens* in his *Historia Stirpium*, and others were 'engraved in the reign of the empress *Maria Theresa* under the inspection of *Jacquiu*. Two impressions only of these plates, as far as we can learn, have ever been taken off, as the work was not prosecuted.' One of them is now in the Library of the *Linnæan Society*; the other is, we believe, with *Sibthorp's* collection at Oxford. They are of little importance, as the figures are of the rudest imaginable description. Another manuscript of the 9th century exists at Paris and was used by *Salmasius*; this also is illustrated with figures, and has both Arabic and Coptic names introduced, on which account it is supposed to have been written in Egypt. Besides these, there is at Vienna a manuscript believed to be still more antient than that first mentioned, and three others are preserved at Leyden.

The first edition of the Greek text of *Dioscorides*, was published by *Aldus* at Venice, in 1499, fol. A far better one is that of Paris, 1549, in 8vo. by *J. Goupyl*; but a better still is the folio Frankfort edition, of 1598, by *Saracenus*. *Sprengel* laments, 'nullum rei herbariæ peritum virum utilissimo huic scriptori operam impendisse.' Nevertheless, there have been many commentators, of whom some, such as *Fuchs*, *Amatus Lusitanus*, *Ruellius*, *Ta-*

bernsmontanus, *Tragus*, and *Dalechampia*, are of no sort of authority, while others, especially *Matthiolum*, *Maranta*, *Cordus*, *John Bauhin*, and *Tournefort*, among the older, with *Sibthorp*, *Smith*, and *Sprengel*, among modern commentators, deserve to be consulted with attention. The last edition of the Greek text is by *Sprengel*, in the collection of Greek Physicians by *Kühn*, Leipzig, 1829, 8vo., which has been improved by a collation of several MSS. *Dr. Sibthorp*, who visited Greece for the purpose of studying on the spot the Greek plants of *Dioscorides*, must be accounted of the highest critical authority; for it frequently happens that the traditions of the country, localities, or other sources of information throw far more light upon the statements of this ancient author than his own descriptions. It will ever be a subject of regret to scholars, that *Dr. Sibthorp* should have died before he was able to prepare for the press the result of his inquiries; what is known of them is embodied in the *Prodromus Floræ Græcæ*, published from his materials by the late *Sir James Edward Smith*, and in the *Flora Græca* itself, consisting of 10 vols. fol. with nearly 1000 coloured plates, commenced by the same botanist, and now nearly completed under the direction of *Professor Lindley*. [*SIBTHORP*.] So far as European plants are in question, we may suppose that the means of illustrating *Dioscorides* are now nearly exhausted; but it is far otherwise with his Indian and Persian plants. Concerning the latter, it is probable that much may be learned from a study of the modern *Materia Medica* of India. When the *Nestorians*, in the fifth century, were driven into exile, they sought refuge among the *Arabs*, with whom they established their celebrated school of medicine, the ramifications of which extended into *Persia* and *India*, and laid the foundation of the present medical practice of the natives of those countries. In this way the Greek names of *Dioscorides*, altered indeed, and adapted to the genius of the new countries, became introduced into the languages of *Persia*, *Arabia*, and *Hindustan*, and have been handed down traditionally to the present day. Thus *Dr. Royle* has shown, by an examination of this sort of evidence, that the *Kalamos aromatikos* of *Dioscorides* is not a *Gentian*, as has been imagined; that *Nardos Indike* is unquestionably the *Nardostachys Jatamansi* of *De Candolle*, and that the *Lakion Indikon* was neither a *Rhamnus*, nor a *Lycium*, but as *Prosper Alpinus* long ago asserted, a *Berberis*. With regard to the last plant, *Dr. Royle* states that *Berberis* is at the present day called in *India* *hooziz* *hindee*, or *Indian hooziz*; this last word has for its Arabic synonym *loofyon* or *lookyon*; therefore the *Berberry* is still called *Indian lycium*, with the reputed qualities and uses of which it moreover corresponds.

DIOSMA, a genus of Rutaceous shrubs inhabiting the Cape of Good Hope. They have alternate simple leaves, strongly marked with dots of transparent oil, and diffusing a powerful odour when bruised. Some of the species are to European taste offensive, as the *Buckus*, with which the *Hottentots* perfume themselves, and which are chiefly yielded by *D. crenata* and *serratifolia*. The flowers of most are white; those of a few are red. *Diosma crenata* itself, which is reputed a powerful antispasmodic, is thus described:—

An erect shrub, smooth in every part, and growing a foot or so high; branches tapering, purplish, long, lax; branchlets somewhat whorled, ternate, or scattered, angular, purple, twiggy, incurved, loose. Leaves alternate, on short stalks, ovate-oblong, blunt, flat, smooth, deep green above, paler beneath, dotted with sunken glands, the midrib somewhat keeled, the margin scolloped, glandular-dotted, and shining. Flowers solitary, white, middle sized. Peduncles filiform, shorter than the leaves.

By most modern botanists the old genus *Diosma* is broken up into eight, namely, *Adenandra*, *Coleonema*, *Diosma* proper, *Euchæstis*, *Acmadenia*, *Baryosma*, to which the *Buckus* belong, *Agathosma*, and *Macrostylis*.

Diosma crenata (Linn.) and *Diosma serratifolia* (Vent.) yield leaves which at the Cape of Good Hope are termed *buchu*, or *bucco*, and which are sometimes used alone, but more frequently mixed. When bruised they emit a strong peculiar odour, resembling rosemary or rue. The taste is aromatic, but not bitter or disagreeable.

Cadet de Gassecourt analysed the leaves, and found no alkaloid, but 6.65 of volatile oil; 21.17 extractive; 2.15 resin; 63 lignin; 1.10 chlorophyll. *Brandes* considers the extractive to be peculiar, and terms it *Diosmin*, analogous to ca-

thartin. The volatile oil and the extractive appear to be the active ingredients. They are usually administered in the form of infusion. *Buchu* leaves have been long known to the *Hottentots* as a remedy against rheumatism, cramps, and above all in affections of the urinary organs. They have of late years been introduced into European practice. In their action they resemble those of the *arctostaphylos uva ursi*, but from their containing volatile oil, *buchu* leaves are in many cases preferable. [*BEAR'S WHORTLE-BERRY*.]

DIP, in magnetism, the angle which the magnetic needle, freely poised on its centre of gravity and symmetrically formed in both its arms, makes with the plane of the horizon. It is more scientifically termed the inclination of the needle, or the magnetic inclination. [*INCLINATION and MAGNETISM*.]

DIPHILUS. [*ATHENS*, vol. ii., p. 18.]

DIPHTHONG (*διφθόγγος*) is the sound of two vowels pronounced in rapid succession, as the German *au* in *maus*, pronounced precisely like the English word *mouse*, the vowel sound consisting of the broad *a* of *father*, followed quickly by the sound of *u* or *oo*. Again, the *i* in the English word *mind*, though represented by a single character, is virtually a diphthongal sound, consisting of the broad *a* of *father*, followed by the vowel sound which is heard in *mean*. The name diphthong however is commonly given to any vowel sound represented by the junction of two vowels, as in *dream*, though the sound produced is not compounded.

All diphthongs are said to be long syllables; and this would be true if they were only employed to mark the union of two vowel sounds. This probably was originally their sole office; for in many English words now written with diphthongs, but pronounced as if they had single vowels, an earlier pronunciation contained the double sound; and indeed this view is often supported by the provincial pronunciation of a word. For example, such words as *meat*, *dream*, are pronounced in many parts of England as dissyllables, *meät*, *dreäm*. In practice however a diphthong is often used where the vowel sound is not only uncompounded but short, as in *friend*, *breadth*.

Again, diphthongs are occasionally used to represent simple sounds intermediate between the vowels, as in the English word *cough*, and the German sounds represented by *ae*, *oe*, *ue*, commonly written *ä*, *ö*, *ü*, where the dots placed over the vowels are merely a corruption of the letter *e*.

DIPHUCEPHALA, a genus of coleopterous insects belonging to the *Lamellicornes*, section *Phyllophagi*.

This genus appears to be confined to Australia, and the species of which it is composed are distinguished from those of allied genera chiefly by their having the clypeus deeply emarginated; they are of an oblong form; the thorax is attenuated anteriorly, the elytra are somewhat depressed, and the abdomen is very convex. The antennæ are eight-jointed, and the club is composed of three joints; the anterior tibiae are generally dentated externally; the anterior tarsi of the males have the four basal joints dilated, and furnished with a velvet-like substance beneath, and all the claws are bifid.

A rich golden green appears to be the prevailing colour of these insects, and we understand that they are found on flowers.

Diphucephala sericea (Kirby) is nearly half an inch in length, of a golden green hue, and has a silk-like gloss on the upper parts; the legs are red; the anterior tibiae have an obtuse tooth-like process on the outer side, near the apex; the head and thorax are very thickly and delicately punctured; the elytra are covered with confluent punctures which are arranged in longitudinal rows, and each elytron has two smooth elevated striæ; the under parts of the body are covered with white scale-like hairs.

This is the largest species known; there are however many which are nearly equal to it in size. The genus *Diphucephala* forms the subject of a monograph in the first volume of the 'Transactions of the Entomological Society of London,' where sixteen species are described.

DIPHYDES, **DIPHYDÆ**, a family of zoophytes, thus characterized by *M. de Blainville*, and placed by him between the *Physograda* and the *Ciliograda*.

Body, bilateral and symmetrical, composed of a very small, nucleiform, visceral mass, and two natatory organs, which are contractile, subcartilaginous, and serial; one anterior,

in more or less immediate connexion with the nucleus, which it seems to envelop; the other posterior, and but little adherent.

Head, at the extremity of a more or less proboscoidiform stomach.

Vent, unknown; a long cirrhiiform and ovigerous production, proceeding from the root of the nucleus, and prolonging itself more or less backwards.

M. Bory de St. Vincent, in his voyage to the African coasts, appears to be the first who noticed these animals, which abound in all the seas of warm latitudes, with any degree of certainty. He considered them to be *Biphoes* (Salpa). Tilesius also said something of them in the zoological part of Krusenstern's voyage.

But it was Cuvier who first formed these creatures into a separate genus, under the name of *Diphyes*, and he placed them at the end of his *Hydrostatic Acalephans*, immediately after *Stephanomia* of Péron. Cuvier describes the genus as very singular, consisting of two individuals, which are always together, one including itself in a hollow of the other (l'un s'emboîtant dans un creux de l'autre), an arrangement which nevertheless permits their separation without the destruction of life. They are, he observes, gelatinous, transparent, and move very nearly like the *Mедуза*. The including individual (l'emboîtant) produces from the bottom of its hollow a chaplet (chapelet), which traverses a demi-canal of the included individual (l'emboîté), and would seem to be composed of ovaries and of tentacula and suckers like those of the preceding genera. Cuvier then goes on to state the divisions established by MM. Quoy and Gaimard, according to the relative forms and proportions of the two individuals. Thus, in the *Diphyes*, properly so called, the two individuals are nearly alike, pyramidal, and with some points round their opening, which is at the base of the pyramid. In the *Calpes*, the included individual has still the pyramidal form, but the including individual is very small and square. In the *Aboles*, the included individual is oblong or oval, and the including rather smaller and bell-shaped. In the *Cuboides*, it is the included individual which is small and bell-shaped; the including individual is much larger and square. In the *Navicules*, the included individual is bell-shaped; the including individual large also, but slipper-shaped (en forme de sabot). Cuvier concludes by remarking that there are many other combinations, and refers to the memoir of MM. Quoy and Gaimard, in the 'Annales des Sciences Naturelles,' tome x. This, then, is the account given by Cuvier in his last edition of the 'Règne Animal;' but it was in the first that he established the genus, and in that edition he evidently knew of only one species from the Atlantic, for which he refers to M. Bory's 'Voyage,' and places the genus among his free Acalephans, between *Cestum* of Lesueur and *Porpita* of Lamarck. It is to the first edition that M. de Blainville refers in his 'Actinologie,' and he there says that in fact M. Lesueur, more than a year previously, had sent him the drawing of a genus of the same family, to which Lesueur had given the name of *Amphiora* (Amphiroa?), and which M. de Blainville observes was, from what he now knows of the *Diphyes*, very nearly approximated to them, to say the least; but the want of information as to the characters of the genus prevented him (De Blainville) from publishing it. He remarks, that he ought to add that Lesueur was more fortunate than Cuvier, inasmuch as the former had at his disposal a complete and living animal; while the latter characterized as one *Diphyes* an animal composed of two individuals, giving as the type the anterior moiety only, to which he attributes two apertures, one for the mouth and the other for the exit of the cirrhiogenous production which he regards as the ovary. M. de Blainville then, after some further observations as to the place assigned to the animal by Cuvier, refers to the 'Memoir of MM. Quoy et Gaimard,' above mentioned, and states that during the rest of their voyage those zoologists had met with more *Diphyes*, of which they had formed distinct genera, and had submitted them to his examination; that he had also obtained some beautiful drawings of these animals, made by Lesueur in the Gulf of Bahama; and that M. Paul-Emile Botta, placed by his recommendation on board a merchant-ship about to make a voyage round the world, had also communicated to him the observations which he (Botta) had been able to make on the genus; so that, difficult as the study of these singular animals may be, he thinks that he has been able to arrive at their true natural relations, aided, above all,

by an examination of certain species of *Physophores*. M. de Blainville then states that the body of a *Diphyes*, at first sight, and especially as it appears during life, seems to be composed of two polygonal, subcartilaginous, transparent parts, placed one after the other, the posterior portion penetrating more or less into an excavation of the anterior portion. These two parts, constantly more or less dissimilar, have this in common: viz., that they are ordinarily more or less profoundly hollowed out by a blind cavity opening externally by a very large and regular, though diversiform aperture. Adding to this a production regarded as the ovary by Cuvier, and which comes out of the superior cavity of the anterior cartilaginous part, we have the whole that had been remarked about the *Diphyes* before the memoir of Quoy and Gaimard, who have described numerous species which they have observed, very nearly like Cuvier; with this modification, however, that they have considered the two parts as belonging to the same animal: but the study of the differences of form necessary for the establishment of the new genera which they have proposed, and above all, the good figures which they have given, have enabled them to go further, and to see in the *Diphyes* something beyond the two subcartilaginous parts. In fact, taking for example the *Calpes*, and especially the *Cucubali* and the *Cuculli*, it is seen that the bodies of the *Diphyes* form true nuclei, situated at the anterior part of the entire mass, and that the nucleus is composed of a proboscoidian oesophagus, with a mouth having a cupping-glass-like termination (en ventouse), continuing itself into a stomach surrounded with green hepatic granules, and sometimes into a second, filled with air. There is, moreover, to be remarked, at the lower part, a glandular mass, which is probably the ovary, and is in more or less immediate relation with the cirrhiogenous and perhaps oviferous production, which is prolonged backwards. This nucleus would seem to be more or less enveloped by the anterior cartilage, which offers to it, in fact, a cavity sometimes distinct from the second (which has been mentioned above), serving for locomotion, and at other times confounded with it; it is, besides, in intimate connexion with its tissue by filaments, which M. de Blainville believes to be vascular. It has been already remarked that the posterior part of the body is hollowed out by a great cavity, which is continued nearly throughout its length: and it is from the bottom of this cavity that a prolongation, perhaps equally vascular, proceeds, which goes above the root of the oviferous production, and unites itself, without doubt, with the nucleus. 'Thus,' continues M. de Blainville, 'it would appear to me certain that this part really belongs to the *Diphyes*; but it is easy to conceive how it may be detached by the slightest effort, because the union is only effected by a single filament.'

After this statement of the organization of *Diphyes*, one may see that the part which M. Cuvier regarded as by itself constituting the animal, is only an organ of minor importance; that there must be added to it the posterior part, which was regarded as a distinct individual; but above all, that it is necessary to take into the account the visceral nucleus, which, with the oviferous production, forms the essential part of the animal. From this analysis of a *Diphyes*, it is evident that it cannot be an animal of the type of the *Actinozoaria*; but in order to establish its natural relationship, let us see what the observers above named have recorded of its manners and habits.

'The *Diphyes* are very transparent animals, so that it is often very difficult to distinguish them in the sea, and even in a certain quantity of water taken from it. It is especially at considerably great distances from the shore that they are met with in the seas of warm climates, and often very numerous. They float and swim apparently in all directions, with the anterior or nuclear extremity foremost, and getting rid of the water which they take in, by the contraction of the two subcartilaginous parts; their aperture, consequently, is always directed backwards. When the two natatory organs are equally provided with a special cavity, it is probable that the locomotion is more rapid; it can, finally, be executed by either the one or the other, in proportion to their size. The posterior part is attached to the nucleus with so little solidity, that it often happens that it detaches itself from it accidentally; so that M. Botta believed that an entire *Diphyes* was only formed by one of these parts, he having but very rarely found these animals complete. During locomotion the cirrhiogenous and oviferous production apparently floats extended backwards,

lodging itself partly in a gutter, into which the inferior edge of the posterior natatory organ is hollowed out; but it has not the same length, the animal being able to contract it powerfully and even to the extent of withdrawing it inwards entirely; from this it is evident that this organ is muscular. But what is very remarkable is, that throughout its length, and placed at sufficiently regular distances, are found organs which MM. Quoy and Gaimard regarded as suckers, and which possessed, in fact, the faculty of adhesion and bringing the animal to anchor, as M. Botta was satisfied. I dare not decide what this organ is; but I am strongly inclined to believe either that it is a prolongation of the body analogous to that in the *Physosiphonæ**, or that it is, if not an ovary, at least an assemblage of young individuals, a little like what takes place in the *Biphores*.

In the actual state of our knowledge with regard to the *Diphyes*, it seems to me that they are, so to speak, intermediate between the *Biphores* and the *Physosiphonæ*. They approach the first, whose cartilaginous envelope is sometimes tripartite, as M. Chamisso has taught us, inasmuch as that the visceral mass is nucleiform, that it is contained in great part in this envelope, that the latter has two apertures, and that it is by contraction that it executes locomotion. We find, on the other hand, a mode of approximating the *Diphyes* to the *Physosiphonæ*, in regarding the natatory organs as analogous to those which we have seen in *Diphyes*, which has the smallest before and the largest behind, both the one and the other being perfectly bilateral. The mouth is also at the extremity of a sort of proboscis. There is sometimes a bullöid swelling full of air: finally, the body is terminated by a cirriferous production, which is perhaps oviferous. For the rest we are obliged to agree that these approximations require, before they are freed from doubt, a more complete knowledge than we at present possess, not only of the organization of the *Diphyes* and *Physosiphonæ*, but also of the *Biphores* themselves. According to the views of M. Mertens, chief naturalist in the last circumnavigation of the Russians, the *Diphyes* would be no other than *Stephanomizæ*; in which case the oviferous and cirriferous productions of the *Diphyes* must be considered the analogues of the posterior and tubular part of the *Stephanomizæ*. We have already said that MM. Quoy and Gaimard, in their memoir on the *Diphyes*, had established many new genera, having in view principally the form and the proportion of the two natatory organs or parts of the body. M. Lesueur has also established genera, some of which may be incorporated with those of the zoologists of the *Astrolabe*; unfortunately our knowledge of these genera is confined to figures only. Lastly, M. Otto has proposed one or two, but they are founded on detached parts or incomplete animals. The greater part of these genera are not, in reality, very distinct; we adopt them nevertheless provisionally at least in order to facilitate the study of beings so singular. The *Diphyes* seem to us capable of division into two great sections, according as the anterior part is provided with a single or double cavity. M. Eschscholtz, in his systematic distribution of the species of *Diphyes*, has regard to the number of cavities of the anterior natatory organ, and to the presence of one or more suckers in the tubular production. From this test have resulted genera otherwise circumscribed, and not less numerous than from our manner of viewing the subject.

The following is M. de Blainville's arrangement.

a.

Diphyes whose anterior part has but a single cavity.

Genera, *Cucubalus*.

Body, provided with a large probosciform exsertile sucker, with a bunch (grappe) of ovaries at its base, lodged in a large single excavation of a natatory anterior cordiform organ, receiving also the posterior, which is also cordiform and hollowed into a cavity with a posterior and sub-oval orifice.

Example, *Cucubalus cordiformis*, the only species cited of the genus established by MM. Quoy and Gaimard. Length, two lines. Differs from the other *Diphyes*, first, in having the nucleus much less hidden and sunk in the anterior natatory body, which has moreover only one large cavity in which it is plunged; secondly, in having the ovi-

* This (says M. de Blainville) is the opinion of M. Eschscholtz, who gives to this part the name of *ductus substriatus* (nourishing canal), which, he says, is capable, or provided with a single sucker, in the first section, and complex furnished with many suckers, in the second.

ferous production very short; and, lastly, in the mode of locomotion, for the animal always swims vertically

Cucubalus cordiformis.

Cucullus.

Body furnished with a great, exsertile, probosciform sucker, with a bunch of ovaries at its base, lodged in a deep excavation, the only one in the anterior natatory organ, in form of a hood, in which the posterior is inserted (s'emboîte); the latter is tetragonal and pierced behind with a rounded terminal orifice.

Example, *Cucullus Doreyanus* (Quoy and Gaimard). Locality, New Guinea.

Cucullus Doreyanus.

M. de Blainville observes that this genus does not really differ from the preceding, excepting in the form of the natatory organs, and he doubts the propriety of retaining it, especially as it consists but of one species. M. Botta, he observes, who had occasion frequently to observe in nearly all the seas of warm climates, from the coast of Peru to the Indian archipelago, a great number of animals resembling the *Cucullus* of MM. Quoy and Gaimard, and having found them sometimes free and at other times forming part of the cirriferous and oviferous production of the ordinary *Diphyes*, has been led to think that the *Cucullus* may be only a degree of development of a *Diphyes*. Although, concludes M. de Blainville, this is conceivable up to a certain point, inasmuch as in the *Cucullus* there is no cirriferous production, which seems to prove that they are not adults, the difference nevertheless of the natatory organs is so great that he dares not come to this decision.

Cymba (Nacelle).*

Body furnished with a large exsertile probosciform sucker, having at its base a mass of ovariform organs, lodged in the single and rather deep cavity of a naviform natatory organ, receiving and partially hiding the posterior natatory organ, which is sagittiform, pierced behind with a rounded orifice crowned with points, and hollowed on its free border by a longitudinal gutter.

Example, *Cymba sagittata* (Quoy and Gaimard); *N. sagittata* (De Blainville). Locality, Straits of Gibraltar.

N. sagittata.

M. de Blainville remarks that he ought to observe that M. Eschscholtz says that this genus, to which he unites the two following genera, possesses an anterior natatory organ with two cavities, and of these the natatory cavity projects in the form of a tube. M. de Blainville further observes that this genus does not differ from the *Cucullus*, except in the form of the natatory organs; in fact, the disposition of the nucleus in the bottom of the single cavity into which

* Mr. Broderip had appropriated this name to a subgenus of *Volutilis*. See Sowerby's 'Genera of recent and fossil Shells,' No. 28, and Mr. B.'s Monograph in Mr. Sowerby's 'Species Conchylorum.'

† Navicula?

the anterior organ is hollowed, and the penetration of the posterior organ into this same cavity are absolutely the same as in the two preceding genera, as M. de Blainville has been able to satisfy himself from the examination of many individuals preserved in spirit.

Cuböides.

Body nucleiform, provided with a large probosciform sucker, surrounded by an hepatic mass, having at its base an ovary, whence proceeds a filiform ovigerous production, contained in a large, single, hemispherical excavation of an anterior, cuböid, natatory organ, much larger than the posterior one, which is tetragonal, and nearly entirely hidden in the first.

Example, *Cuböides vitreus* (Quoy and Gaimard). Locality, Straits of Gibraltar.

Cuböides vitreus.

a, nat. size; b, magnified.

This again, according to M. de Blainville, is a genus scarcely distinguishable from the preceding genera, and only by the form and proportion of the natatory organs. 'As,' says M. de Blainville, 'I have had a considerable number of individuals at my disposal, I have been able to satisfy myself as to the characteristic which I have given of them. I have in fact clearly recognized that the great and single cavity of the anterior and cubic organ contained a considerable visceral nucleus, in which I have been able to distinguish a sort of probosciform stomach, surrounded at its base with an hepatic organ; and further backward, a granular ovary, contained in its proper membrane, and whence escaped a long ovigerous production. I have also been equally able to satisfy myself that the natatory posterior organ, of the same conformation, as far as the rest, as in the true *Diphyes*, was entirely hid in the excavation of the anterior organ with the visceral mass.

Enneagona.

Body nucleiform, provided with a large exsertile sucker, having at its base an assemblage of ovaries, whence proceeds an oviferous production. Anterior natatory organ enneagonal, containing with the nucleus in a single? excavation the posterior organ, which is much smaller, with five points, and canaliculated below.

Example, *Enneagona hyalina* (Quoy and Gaimard).

Enneagona hyalina.

1, 1 a, 1 b, *Enneagona hyalina* under different aspects; 1 c, visceral part; 1 d, nucleus.

Amphiroa.*

Body nucleiform, of considerable volume, furnished with a probosciform stomach, having at its base a bunch of ovaries, prolonged into a long filament, contained in an anterior, polygonal, short, natatory organ, cut squarely, with a single cavity in which the posterior organ, which is equally short, polygonal, and truncated, is inserted.

Example, *Amphiroa alata* (Lesueur). Locality, Seas of Bahama.

M. de Blainville observes that this genus is only known by the beautiful figures sent by M. Lesueur, and of which one reached M. de Blainville more than ten years ago, but without description, the want of which prevented him from publishing it. Nevertheless it is evident, he remarks, on referring to these figures, that the *Amphiroæ* are *Diphydæ*, but with natatory organs of a particular form and propor-

* The term *Amphiroa* is also employed by Lamouroux and others to distinguish a genus of Corallinea.

Amphiroa alata.

1, 1 a, *Amphiroa alata*; 1 b, its nucleus extract.

tion. Another species, he adds, *Amphiroa tru* appear to approximate nearly to the *Calpes* of Quoy and Gaimard, by the great disproportion of the

β.

Diphydæ whose anterior part is furnished with distinct cavities.

Calpe.

Body nucleiform, without an exsertile probosciform sort of aeriferous vesicle, and at its base prolonged into a long cirriferous and oviferous. Anterior natatory organ short, cuböid, having locomotive cavity; posterior natatory organ truncated at the two extremities, not penetrating into the anterior organ, and provided with a round texture.

Example, *Calpe pentagona* (Quoy and Gaimard). Locality, Straits of Gibraltar?

Calpe pentagona.

1, *Calpe pentagona* (profile); 1 a (under side); 1 b, 1 c, 1 d, 1 e, 1 f, 1 g, 1 h, 1 i, 1 j, 1 k, 1 l, 1 m, 1 n, 1 o, 1 p, 1 q, 1 r, 1 s, 1 t, 1 u, 1 v, 1 w, 1 x, 1 y, 1 z.

M. de Blainville observes that this genus is distinctly distinct from the true *Diphyes*, with nevertheless many relations, not only by the great difference of the two locomotive organs, but because the anterior organ is only applied against the anterior one, and does not penetrate into the visceral cavity. He remarks that he examined some individuals well preserved in spirit, and easily seen that the nucleus is composed of a soft mass with a sessile mouth and with a small hepatic process of a green colour applied against it, and beset with aeriferous bladder situated behind. At the base of the stomachal swelling is the ovary, formed of granules, and which seems to prolong itself by a long production charged with oviform bodies, longer and more bell-shaped. This production arises from the anterior natatory organ, and passes into the posterior one in following the gutter into which it is lowered on its lower surface. Finally, this production is equally truncated at the two extremities, nearly throughout its length into a great cavity, the bottom of which a vessel which is continued to the ovary of the nucleus may be clearly seen to

Abyla.

Body nucleiform, inconsiderable, with a very small and oviferous production. Anterior natatory organ much shorter than the other, subcuböid, with

cavity for the reception of the anterior extremity of the posterior natatory body, which is polygonal and very long.

Example, *Abyla trigona* (Quoy and Gaimard). Locality, Straits of Gibraltar.

[*Abyla trigona*.]

1, *Abyla trigona*; 1 a, posterior part; 1 b, anterior or visceral part.

M. de Blainville observes that this genus does not really differ from the preceding, excepting in the form of the natatory organs, and above all in that the anterior part is pierced with a depression sufficiently considerable for the lodgment of a part of the other, which has a long inferior furrow (sillon) and a posterior terminal opening. To this genus M. de Blainville refers a species of *Diphyda*, found by MM. Quoy and Gaimard in Bass's Strait, and of which they had provisionally formed the genus *Bassia*, which does not seem to M. de Blainville to be sufficiently characterized.

M. Eschscholtz, remarks M. de Blainville, rightly unites this genus with the preceding, as well as the genus *Rosacea* of Quoy and Gaimard, the latter perhaps erroneously.

Diphyes.

Body nucleiform indistinct, situated in the bottom of a deep cavity, whence proceeds a long tubular production, furnished throughout its extent with proboscoidiform suckers, having at their root granular corpuscles and a cirriferous filament. Natatory bodies nearly equal and similar; the anterior with two distinct cavities, the posterior with a single one, with a round aperture provided with teeth.

Example, *Diphyes Bory* (Quoy and Gaimard); *Diphyes campanulifera* (Eschscholtz).

[*Diphyes Bory*.]

1, The entire animal (profile); 1 a, anterior part of the same; 1 b, posterior part; 1 c animal magnified; 1 d, posterior part of the same.

M. de Blainville observes that the denomination of *Diphyes*, employed by M. Cuvier for a single species, which P. C., No. 532,

is the most common and the most generally spread in all seas, is used in the work of MM. Quoy and Gaimard for species which have the natatory organs nearly equal in form and size, the first whereof has two deep cavities, of which the one receives a part only of the other which has a long inferior ridge for the lodgment of the cirriferous production. M. Lesueur, he adds, who has equally adopted this division of the *Diphyda*, gives it the name of *Dagysa* adopted by Solander, and also by Gmelin; but M. de Blainville asks, is it certain that the animal seen by Solander was a *Diphyes*, and not a *Biphore*? He adds, that M. Lesueur has figured five species belonging to this genus perhaps all new, and from the seas of South America.

7.

Doubtful species, or those with one part only.

Pyramis.

Body free, gelatinous, crystalline, rather solid, pyramidal, tetragonal, with four unequal angles, pointed at the summit, truncated at its base, with a single rounded aperture communicating with a single deep cavity, towards the end of which is a granular corpuscle.

Example, *Pyramis tetragona* (Otto).

[*Pyramis tetragona*.]

This genus was established by M. Otto, and M. de Blainville admits that he knows no more of it than is to be collected from M. Otto's description and figure. He seems to doubt, however, whether the genus may not have been founded on the posterior natatory organ of a *Diphyes*, perhaps of the division properly so called.

M. Eschscholtz makes this organized body a species of his genus *Eudoxia*, which comprehends *Cucubalus* and *Cucullus* of Quoy and Gaimard, admitting that the two natatory organs are intimately united so as to form, apparently, but one.

Praia.

Body? subgelatinous, rather soft, transparent, binary, depressed, obtuse, and truncated obliquely at the two extremities, hollowed into a cavity of little depth, with a round aperture nearly as large as the cavity, and provided with a large canal or furrow above.

Example, *Praia dubia* (Quoy and Gaimard).

[*Praia dubia*.]

M. de Blainville describes, from personal observation, this provisional genus of MM. Quoy and Gaimard as being subgelatinous, rather soft, and transparent. Its form, he remarks, is regularly symmetrical, and it seems to be divided into two equal parts by a great furrow which traverses it from one end to the other. It has a shallow cavity with a rounded aperture, without denticles or appendages at its circumference. In the tissue M. de Blainville perceived a mesial vessel, giving off two lateral branches, with very similar ramifications; and he is inclined to think that the form is only the natatory organ of some large species of *Physophora*: the substance is too soft for a true *Diphyes*.

Tetragona.

Body? gelatinous, transparent, rather solid, binary, of an elongated, parallelopiped, tetragonal form canaliculated below, truncated obliquely anteriorly, pierced behind by a gaping orifice furnished with symmetrical points, and leading into a long blind cavity.

Example, *Tetragona hispidum* (Quoy and Gaimard).

[*Tetragona hispidum*.]

1. *Tetragona hispidum*; 2, 3, 4, details of the same.

M. de Blainville is of opinion that this is only the posterior or inferior latatory organ of a true *Diphyes*.

Sulculeolaria.

Body ? subcartilaginous, transparent, elongated, cylindrical, traversed throughout its length by a very large furrow, bordered with two membranes, truncated at the two extremities, with a posterior aperture, with appendicular lobes on its circumference and leading into a very long and blind cavity.

Example, *Sulculeolaria quadrivalvis* (Lesueur). Locality, Mediterranean (Nice).

[*Sulculeolaria quadrivalvis*.]

A genus characterized by De Blainville, who found it established in the figures of Lesueur, from those figures; but the former is strongly inclined to believe that the genus is founded on the part of an animal, and not on an entire one. If these bodies should turn out to be merely organs or parts, M. de Blainville thinks they ought to belong to the genus *Calpe* of Quoy and Gaimard.

Galeolaria.

Body gelatinous, rather firm, perfectly regular, symmetrical, subpolygonal or oval, compressed on the sides and furnished with two lateral rows of extremely fine cirri. A large posterior aperture pierced in a sort of diaphragm with appendicular lobes, binary above, leading into a large cavity with muscular walls. An ovary at the anterior superior surface, coming out by a mesial and bilabiated orifice.

Example, *Galeolaria australis*, *Beröides australis* (Quoy and Gaimard).

[*Galeolaria australis*.]

Known to M. de Blainville from the drawings of Lesueur, who gave the form the name of *Galeolaria*, which the former adopts in preference to *Beröides*, the term employed by Quoy and Gaimard. *Galeolaria* however is the name given by Lamarck to a genus of his *Serpulidae*. From the manuscript memoir of Quoy and Gaimard lent by them to De Blainville, he ascertained the peculiarity of the two rows of cilia on each side. Botta sent him also in spirit

many individuals obtained in the course of his circumnavigation. It seemed to De Blainville that these animals differed really from the *Diphyes*, and approached the *Beröes*. To confirm this approximation it would have been necessary to find the posterior aperture of the internal canal, of which, he remarks, no observer has spoken; but it appears to him that the existence of the two series of cirri, their relation with a canal which follows their root, the distinct and muscular walls of the cavity, and the position of the ovary, are sufficient to show in these animals a passage at least towards the *Beröes*.

Rosacea.

Body free, gelatinous, very soft, transparent, suborbicular, with a single terminal aperture at one of the poles leading into an oval cavity which communicates with a depression, whence proceeds a cirriferous and oviferous production.

Example, *Rosacea Centensis* (Quoy and Gaimard).

[*Rosacea Centensis*.]

Eschscholtz unites this genus with those of *Calpe* and *Abyla* under the first appellation. De Blainville, who states that he only knows the form from the figures and description given by Quoy and Gaimard, is at a loss to determine positively what it is, but he supposes it to be a *Physophora* rather than a *Diphyes*.

Noctiluca.

Body free, gelatinous, transparent, spheroidal, reniform, with a sort of infundibuliform cavity, whence proceeds a proboscoidiform, contractile production.

Example, *Noctiluca miliaris*, Lamarck.

[*Noctiluca miliaris*.]

M. Surriray, a doctor of medicine, while investigating the cause of the phosphorescence of the sea-water at Havre, appears to have been the first who observed and called attention to the genus *Noctiluca*, which he described and figured in the memoir that he communicated to the class of sciences of the French Institute. Its size hardly equals that of a small pin's head, and it is as transparent as crystal; he found it very common in the basins at Havre, sometimes in such abundance as to form a considerably thick crust (croûte assez épaisse) on the surface of the water. Lamarck adopted the genus, placing it between *Beröe* and *Lucernaria*, which last, in his system, immediately precedes *Physophora*. To these minute animals Dr. Surriray attributes the phosphorescence of the sea at Havre.

M. de Blainville states that he has often had occasion to observe these minute beings with Dr. Surriray, aided by the microscope. 'It appeared to me,' says De Blainville, speaking of *Noctiluca miliaris*, 'nearly regularly spherical, but somewhat notched (fendu), or excavated on its anterior part so as a little to resemble a cherry. From the middle of the excavation proceeds a sort of long cylindrical tentacle diminishing little in size throughout its extent, and terminating in an obtuse extremity. During life this organ moves in all directions somewhat after the manner of an elephant's trunk (en se repliant, un peu à la manière de la trompe de l'éléphant). It seemed to me, in fact, to be composed of annular fibres and traversed by a canal throughout its length, so that it may be supposed to be terminated by a sucker. The body is enveloped in a transparent membrane, forming sometimes irregular plaits. Within may be perceived a kind of funnel-like oesophagus (espèce d'oesophage en entonnoir) commencing anteriorly

towards the proboscis and terminating posteriorly by a sort of spherical stomach. I was unable to determine whether there was an intestinal canal with an anal opening. In some individuals, but, as it would appear, at a certain period or the year only, may be seen in the interior many groups, or small masses irregularly placed and composed of a transparent envelope, containing small globules of blackish brown, which M. Surriay considers to be eggs. At a more advanced period, which M. Surriay supposes to be that of spawning, the water becomes of a red colour (d'un rouge lie de vin), and then there are found a certain number of individuals which have the probosciform production twice its usual length (du double plus long), and which he regards as newly-born animals. The general movements of these small animals appear to be very slow, and are essentially executed by means of the species of trunk which is continually moving from right to left. M. Surriay, who had frequently occasion to observe them, has seen them sometimes disencumber themselves entirely of their membranous envelope even to the tentacula. During life the *Noctiluca* are excessively phosphorescent, and I have verified with M. Surriay the fact that at Hâve the phosphorescence of the sea is owing to these animals; also, that in passing it through a strainer (à travers une étamine), it loses this property, which is much the strongest in warm and stormy weather, much weaker in the winter, and null under a west wind.

De Blainville remarks that though he arranges this animal provisionally in this section, he is far from considering that it is its true place, and that it seems to him, in fact, to have much relation with that form of which MM. de Chamisso and Eisenhardt have made their genus *Flagellum*, and which MM. Quoy and Gaimard have also designated under a particular denomination: he asks, in conclusion, whether *Noctiluca* may not be an animal near the *Cucubali* and *Cucullis*, whose natatory organs have been reduced to the membranous envelope?

Doliolum.

Body ? gelatinous, hyaline, cylindrical, truncated, and equally attenuated at the two extremities, which are largely opened and without apparent organs.

Example, *Doliolum Mediterraneum* (Otto).

[*Doliolum Mediterraneum*.]

M. Otto describes the organism on which he has established this genus as swimming by ejecting and absorbing the water by means of the alternate dilatation and contraction of its two orifices. M. Delle Chiaje (*Mém.*, tom. iii.) seems inclined to believe that the *Doliolum* of Otto is merely a fragment of a species of *Holothuria*, which he names *Holothuria inhaerens*. De Blainville observes that of Otto's description of the motion, &c., above stated, be correct, it is probable that the animal is a true *Biphere*; but if, by any chance, there should be but one opening, then it would be the organ of some *Physophora*, which would agree better with the total absence of internal organs.

M. de Blainville's 'Manual' was published in 1834, and in his 'Nouvelles Additions et Corrections,' dated at the Paris Museum, December, 1836, he declares his persistence in the belief that the *Physograda*, *Diphyda*, and *Ciliograda*, ought not to be comprised in the type of the *Actinozoaria*, but that they ought to form an 'entree-type,' under the denomination of *Malactinozoaria*, indicating that they are, so to speak, intermediate between the *Mollusca* and the *Radiata*. With regard to the *Diphyda*, in particular, he remarks that since the appearance of his 'Manual,' MM. Quoy and Gaimard have published their observations on this group of animals, and that they have abandoned the different generic distinctions (coupes génériques) which they had established in their first memoirs; distinctions, in fact, which scarcely rested on more than the difference of form and the proportion of the natatory organs. They have, moreover, observed that their polymorphous *Biphere* (Uranie, *Zoolog.*, pl. 73, fig. 4) is certainly nothing more than a part of their *Diphyes Abyia*.

M. de Blainville then continues thus:—'The structure of

the *Physophora*, which I have named *Diphyes*, by reason of the existence of two natatory organs only, which are median and placed one before the other, and of rows of cartilaginous *squamellæ* upon the root of the cirriferous productions, does not permit a doubt of the great relationship which exists between the *Diphyes*, properly so called, and the *Physograda*; and that these two great genera ought to be united under the same family, as has been previously stated. M. Brandt has proposed to establish two subgenera only among the *Diphyes*, the first consisting of those in which the cartilaginous scales of the cirriferous production are scattered or distant, as in *Diphyes dispar*, and the second, which he names *Diphyomorpha*, in which the scales are so close-set as to be imbricated, as is seen in the new species observed by Mertens, and named by him *Diphyes Stephanomia*. Among the genera *incertæ sedis*, which, wrong or right, have been connected with *Physophora* or *Diphyes*, without even being very certain that they are animals, we shall cite the two following genera intentionally omitted in our work.'

De Blainville then mentions the following:

CUFULITES (Quoy and Gaimard), placed among the *Physophora*, whose capsules are disposed on each side of a very long axis, established on an organized body, figured pl. 87, fig. 4—16 in the zoological part of the *Voyage of the Uranie*. Not having met with this animal in their second voyage, MM. Quoy and Gaimard doubt (*Astrolabe, Zoolog.*, t. iv. p. 53 n.) whether it is an incomplete *Physophora* or a *Stephanomise* (*Stephanomia*?) with hollow natatory organs. Cuvier places the genus between *Hippopus** and *Racemis*.

POLYTOMA (Quoy and Gaimard, *Zool. of the Uranie*, pl. 87, fig. 12, 13), which may be defined to be an oval mass of globular trivalvular corpuscles (corpuscules globuleux comme trivalves), and which MM. Quoy and Gaimard conceive to be rather a *Biphere* than a *Physograda*.

TETRAGONA (p. 10), Quoy and Gaimard, *Zool. of the Uranie*, pl. 86, fig. 11). This the authors themselves (*Astrolabe* iv. p. 103) have recognized as being nothing more than the posterior point of *Diphyes hispida*.

RACEMIS (Delle Chiaje, Cuvier), figured by Delle Chiaje, *Mém. tab. 50, f. 11, 12*, and described as a globose vesicle endowed with a very quick motion, and disposed towards an ovate shape; but, observes De Blainville, the figures and description are too incomplete to afford a supposition of what it is; in fact, Delle Chiaje confines himself to stating that his *Racemis ovata* executes all the rotatory and rapid motions at the surface of the water, and that those of each vesicle are so lively that it has been absolutely impossible to perceive the aperture with which, according to Delle Chiaje, they are provided. Cuvier only adds to the description of Delle Chiaje, who also places *Racemis* near the *Physophora*, a small membrane with which each vesicle is furnished. M. De Blainville concludes by observing that he had seen a drawing, by M. Laurillard, which had been taken at Nice from one of these organized bodies while alive, and that he supposed that it might well be a mass of eggs of *Mollusca*.

From the difficulties with which the distinguished zoologists above quoted have found this subject surrounded, and the differences of opinion expressed by them, the reader will perceive that the natural history of these extraordinary organized bodies is anything but complete; and we have laid before him the information above given in order that he may see what has been done and how much remains to be elucidated.

DIPHYES. [DIPHYDES.]

DIPHYLLIDIA. [INFEROBRANCHIATA.]

DIPHYSA. [PHYSOGRADE.]

DIPLECTRON. [PAGONIDÆ.]

DIPLOCTENIUM. [MADREPHYLLICEA.]

DIPLODACTYLUS, a genus of Lizards established by Mr. Gray, and regarded by him as forming a new genus in the family of *Geckos*.

Generic character.—Scales subconformable, minute, smooth; the abdominal scales rather large; the caudal scales annulate and larger; the labial scales moderate, distinct, the three anterior ones on each side much the largest; no gular scales. Tail cylindrical, ventricose. Toes 5, 5, simple, subequal, subcylindrical, the points subdilated, bifid beneath, with two oval, oblique, smooth, fleshy disks

* Cuvier quotes this as the generic name of Quoy and Gaimard. 'Hippopus' had been preoccupied by Lamarck to distinguish a genus of conchifers of the family Tridacnidae (Les Tridacnes of Bruguière).

claws 5, 5, small, very retractile. No femoral pores. (Gray.)

This genus differs from *Phyllodactylus* of the same zoologist in having the under sides of the tips of the toes furnished with two rather large oblong tubercles truncated at the tip and forming two oval disks placed obliquely, one on each side of the claw, instead of having, as in *Phyllodactylus*, two membranaceous scales. The scales of *Diplodactylus* are, moreover, uniform, whilst in *Phyllodactylus* there is a row of larger scales extending along the back.

Example, *Diplodactylus vittatus*.

Description. Brown, with a broad longitudinal dorsal fillet; limbs and tail margined with rows of yellow spots.

There are two rows of rather distant small spots on each side of the body. the spots become larger on the upper surface of the tail, and are scattered on the limbs. Length of head and body 2 inches, that of the tail $1\frac{1}{2}$ inch. Locality, New Holland, whence it was brought to England by Mr. Cunningham. (*Zool. Proc.* 1832.)

[*Diplodactylus vittatus*.*]

DIPLODON, Spix's name for a genus of fresh-water conchifers, Naiades of Lea. [ΝΑΙΑΡΕΣ.]

DIPLOMACY is a term used either to express the art of conducting negotiations and arranging treaties between nations, or the branch of knowledge which regards the principles of that art and the relations of independent states to one another. The word comes from the Greek diploma, which properly signifies any thing doubled or folded, and is more particularly used for a document or writing issued on any more solemn occasion, either by a state or other public body, because such writings, whether on waxen tablets or on any other material, used antiently to be made up in a folded form. The principles of diplomacy of course are to be found partly in that body of recognized customs and regulations called public or international law, partly in the treaties or special compacts which one state has made with another. The superintendence of the diplomatic relations of a country has been commonly entrusted in modern times to a minister of state, called the Minister for Foreign Affairs, or, as in England, the Secretary for the Home Department. The different persons permanently stationed or occasionally employed abroad, to arrange particular points, to negotiate treaties commercial and general, or to watch over their execution and maintenance, may all be considered as the agents of this superintending authority, and as immediately accountable to it, as well as thence deriving their appointments and instructions. For the rights and duties of the several descriptions of functionaries employed in diplomacy, see the articles AMBASSADOR, CHARGE D'AFFAIRES, CONSUL, ENVOY.

DIPLOMATICS, from the same root, is the science of the knowledge of antient documents of a public or political character, and especially of the determination of their authenticity and their age. But the adjective, diplomatic, is usually applied to things or persons connected, not with diplomatics, but with diplomacy. Thus by diplomatic proceedings we mean proceedings of diplomacy; and the *corps diplomatique*, or diplomatic body, at any court or seat of government, means the body of foreign agents engaged in diplomacy that are resident there.

Some of the most important works upon the science of diplomatics are the following:—Ioannis Mabillon de Re Diplomatica, lib. vii., fol., Paris, 1681-1709, with the 'Supplementum,' fol., Paris, 1704; to which should be added the three treatises of the jesuit, Barthol. Germon, addressed to Mabillon, 'De Veteribus Regum Francorum Diplomatibus,' 12mo., Paris, 1703, 1706, and 1707:—Dan. Eber. Baringii 'Clavis Diplomatica,' 2 vols. 4to., Hanov., 1754; Ioan. Waltheri 'Lexicon Diplomaticum,' 2 vols. fol., Götting, 1745-7; 'Nouveau Traité de Diplomatique,' par les Bénédictins Tassin, &c., 6 vols. 4to., Paris, 1750-65; 'His-

* We are indebted to Mr. Gray for the figure of this animal.

toria Diplomatica,' da Scipione Maffei, 4to., Mant., 1727; Io. Heumann von Teutschenbrunn 'Commentarii de Re Diplomatica Imperiali,' 4to., Nurem., 1745; Dom de Vaines, 'Dictionnaire Raisonné de Diplomatique,' 2 vols. 8vo., Paris, 1774; J. C. Gatterer 'Abriss der Diplomatik,' 8vo., Götting, 1798; and C. T. G. Schoenemann 'Versuch eines vollständigen Systems der allgemeinen besonders ältern Diplomatik,' 8vo., Götting, 1802.

DIPPER. [MERULIDÆ.]

DIPPING-NEEDLE, an instrument, the essential part of which is the magnetised needle employed to ascertain the DIP or inclination. [INCLINATION.]

DIPROSIA. [PŒCILOPODA.]

DIPSACEÆ, a small natural order of exogenous plants, with monopetalous flowers, nearly allied to Compositæ (otherwise called Asteraceæ), from which it differs in the ovule being pendulous instead of erect, in the embryo being inverted, in the anthers being distinct, not syngenesious, and in the corolla having an imbricated, not valvate aestivation. In habit the species are similar to Compositæ, having their flowers constantly arranged in heads. None of the species are of any importance except the common teasle, *Dipsacus Fullonum*, whose prickly flower-heads are extensively employed in carding wool. Many of the species have handsome flowers, especially the Scabiouses, and are cultivated in the gardens of the curious. Purple and starry Scabious are common hardy annuals.

A portion of the upper part of *Dipsacus Fullonum*.

1, a flower with the hard spiny bract from which it springs; 2, a corolla with two of the stamens, and the ovary containing a pendulous ovule much magnified; 3, a longitudinal section of a fruit, with the pendulous seed and the inverted embryo.

DIPSAS (Laurenti), *Bungarus* (Oppel), a genus of serpents placed by Cuvier under the great genus Coluber.

Description. Body compressed, much less than the head. Scales of the spinal row of the back larger than the others.

Example, *Dipsas Indica*, Cuvier; *Coluber Bucephalus*, Shaw.

Description. Black, annulated with white.

The subjoined cut, from Guerin (*Iconog.*) will illustrate the form.

[*Dipsas cyanodon* (Iconog).]

The term *Dipsas* is also used by Dr. Leach to distinguish a genus of fresh-water conchifers; and he states that its systematic situation is between *Unio* and *Anodonta* (Anodon); *Unio* of Sowerby; *Naiades* of Lea. [NAIADES.]

DIPSASTRÆA. [MADREPHYLLICÆ.]

DIPTERA, one of the orders into which insects are divided. This name was first applied by Aristotle, and has subsequently been adopted by almost all entomologists to designate those insects the most striking characteristic of which is the possession of two wings only.

The common house-fly and blue-bottle fly afford familiar examples of this order. Some dipterous insects, however, are destitute of wings (such as the species of the genera *Melophagus*, *Nycterobia*, &c.); hence it is necessary that we should here notice other peculiarities observable in these insects.

The Diptera have six legs, furnished with five-jointed tarsi, a proboscis, two palpi, two antennæ, three ocelli, and two halteres or poisers.

The wings are generally horizontal in their position and transparent; their nervures are not very numerous, and are for the most part longitudinally disposed, a character in which the wings of dipterous insects differ from those of the orders Neuroptera and Hymenoptera.

The proboscis, situated on the under part of the head, is generally short and membranous, and consists of a sheath (or part analogous to the under lip or labium in mandibulate insects), which serves to keep in situ other parts of the mouth, which, when they are all present, represent the mandibles, maxillæ, tongue, and labium.

There are however considerable modifications in the structure of the proboscis: in some it is long, slender, and corneous, and the number of enclosed pieces, which are generally very slender and sharp, varies from two to six.

It is evident that this structure of mouth is adapted only to the extraction and transmission of fluids; and when these fluids are contained within any moderately tough substance, the parts enclosed by the sheath of the proboscis are used as lancets in wounding and penetrating so as to allow the escape of the fluid, which by their pressure is forced to ascend and enter the œsophagus.

The palpi are situated at the base of the proboscis. The antennæ are placed on the fore part of the head, and approximate at their base; they are generally small and three-jointed; the last joint, however, is often furnished with an appendage, called the stylet, which is considerably diversified, not only in form but in its position.

In some of the insects of this order, the *Tipulidæ* for instance, the antennæ are long, and composed of numerous joints; and in the *Culicidæ* they resemble little plumes.

The eyes in dipterous insects are generally large, especially in the male sex, where they often occupy nearly the whole of the head.

The halteres or poisers are two small organs of a slender form, and furnished with a knob at their apex, situated at the base of the thorax on each side, and immediately behind the attachment of the wings. These organs have been considered by many as analogous to the under wings of four-winged insects. Latreille and others, however, have come to a different opinion, from the circumstance of their not being attached to the same part of the thorax. The use of these organs is not yet ascertained; it is however supposed by some that the little knob which we mentioned is capable of being inflated with air, and that they serve to balance the insect during flight, at which time these organs are observed to be in rapid motion.

As regards the thorax, it is only necessary here to observe that the chief part of that which is visible from above consists of the mesothorax; the prothorax and metathorax being comparatively small.

The scutellum varies considerably in form, and is sometimes armed with spines; we find it developed in an extraordinary manner in the genus *Celyphus** (Dalman), where it is very convex and covers the whole abdomen.

The abdomen seldom presents more than seven distinct segments; its form is very variable.

Dipterous insects undergo what is termed a *complete* transformation: their larvæ are devoid of feet, and have a head of the same soft substance as the body and without determinate form. The parts of the mouth exhibit two scaly pointed plates. The stigmata are nearly all placed on the terminal segment of the body. When about to assume the pupa state, they do not cast their skin (as is the case with the larvæ of most insects), but this becomes gradually hardened, and after a time the animal assumes the pupa state within, so that the skin of the larva forms as it were a cocoon.

There are however exceptions to this rule, for many change their skin before they assume the pupa state, and some spin cocoons.

We may here observe, that in some of the species of the genus *Sarcophaga* the eggs are hatched within the body of the mother, whence the insect first makes its appearance in the larva state; and in the *Pupipara*, not only are the eggs hatched within the body of the parent but the larvæ continue to reside there until their transformation into pupæ.

As regards the habits of dipterous insects, they will be found under the heads of the several families and genera; we shall therefore conclude by noticing the two great sections into which this order is divided by Macquart. These are the *Nemocera* and the *Brachocera*.

The species of these two sections are distinguished chiefly by the number of joints of the antennæ and palpi. Their characters are as follows:—

Section 1. *Nemocera*. Antennæ filiform or setaceous, often as long as the head and thorax together, and composed of at least six joints. Palpi composed of four or five joints; body generally slender and elongated; head small; proboscis sometimes long and slender, and inclosing six lancets; sometimes short and thick, and having but two lancets; thorax large and very convex; legs long; wings long, and with elongated basal cells.

Section 2. *Brachocera*. Antennæ short, composed of three joints; the third joint generally furnished with a stylet; palpi composed of one or two joints; head usually hemispherical, and as broad as the thorax; proboscis either long, slender, coriaceous, and protruded, or short, thick, and retracted, and containing either six, four, or two lancets; thorax moderately convex; legs usually of moderate length. wings with the basal cells rather short.

The principal works on dipterous insects are, Wiedemann

* The great development of the scutellum in the insects of this genus has its parallel in the order Hemiptera, for in the genus *Tetyra* the scutellum also covers the abdomen.

Diptera Exotica, 1 vol. 8vo. 1831. Meigen, *Systematische Beschreibung der bekannten Europäischen zweiflügeligen Insekten*, 6 vols. 8vo. with figures; Macquart, in the *Suites à Buffon, Histoire des Insectes*, 'Diptères,' 2 vols. 8vo.

DIPTERA'CEÆ or **DIPTEROCARPEÆ**, an important order of East Indian exogenous polypetalous trees, allied to Malvacæ. They have a tubular unequal permanent calyx, with five lobes, which after flowering become leafy and very much enlarged, surmounting the fruit without adhering to it. There are five petals, with a contorted aestivation, an indefinite number of awl-pointed narrow anthers, and a few-celled superior ovary, with two pendulous ovules in each cell; of these all are eventually abortive, except one, which forms the interior of a hard dry leathery pericarp. The seed is solitary, contains no albumen, and has an embryo with two large twisted and crumpled cotyledons, and a superior radicle. The leaves are long, broad, alternate, rolled inwards before they unfold, with strong straight veins running obliquely from the midrib to the margin, and oblong deciduous stipules rolled up like those of a *Magnolia*.

The different species produce a number of resinous, oily, and other substances; one a sort of camphor (*Dryobalanops*); another a fragrant resin used in temples; a third Gum Animi; while some of the commonest pitches and varnishes of India are procured from others.

[*Diptercarpus gracilis*.]

1, two of the stamens; 2, a ripe fruit surrounded by the calyx whose segments have become large and leafy, and very unequal.

DIPTERAL. [CIVIL ARCHITECTURE.]

DIPTERIX. [COUMAROUNA.]

DIPTEROCARPUS, a genus of East Indian, and chiefly insular, trees, of which Blume gives the following as the essential character: 'Calyx irregularly five-lobed at the mouth: the two opposite segments very long and ligulate. Petals five, convolute when unexpanded. Stamens numerous; anthers long, linear, terminating in an awl-shaped point. Nut rather woody, and one-celled and one-seeded by abortion, inclosed in the enlarged calyx.' The species are described as enormous trees, abounding in resinous juice, with erect trunks, an ash-coloured bark, strong spreading limbs, and oval leathery entire leaves, with pin-nated veins. The flowers are large, white or pink, and de-

liciously fragrant. The pubescence is always stellate when present. The resinous juice of *D. trinervis*, a tree from 150 to 200 feet high, inhabiting the forests of Java, is made into plaisters for ulcers and foul sores; and when dissolved in spirit of wine, or formed into an emulsion with white of egg, acts upon the mucous membranes in the same way as balsam of copaiva. *Dryobalanops Camphora*, the Camphor tree of Sumatra, is usually referred to this genus; but, according to Blume, is really a distinct genus. [**DRYOBALANOPS.**]

DIPUS. [JERBOA.]

DIPYRE or *leucolite*, a silicate of alumina and lime, which occurs in small slender prisms, the primary form or which has not been determined; their colour is greyish or reddish white, and fasciculated into masses. Internally the lustre is shining; vitreous; opaque; hardness sufficient to scratch glass; specific gravity about 2.6. It is found in the Western Pyrenees. By analysis it yielded—silica 60, alumina 24, lime 10, and water 2. When heated by the blow-pipe it becomes milk white, and then fuses into a blebby colourless glass.

DIRECT and **RETROGRADE**, two astronomical terms, the former of which is applied to a body which moves in the same direction as all the heavenly bodies except comets; the second to one which moves in a contrary direction. The motions of the planets round the sun, of the satellites round their primaries, and of the bodies themselves round their axes, all take place in one direction, with the exception only of the comets, of which about one-half the whole number move in the contrary direction. The course of these celestial motions is always from west to east, which is the *direct* course. The *retrograde* is therefore from east to west. The real diurnal motion of the earth being direct, the apparent motion of the heavens is retrograde, so that the orbital motion of the sun and moon has, so far as it goes, the effect of lessening the whole apparent motion: or these bodies appear to move more slowly than the fixed stars. With regard to the planets, the effect of the earth's orbital motion combined with their own, makes them sometimes appear to retrograde more in the day than they would do from the earth's diurnal motion only. [**PLANETARY MOTIONS.**] In the Latin of the seventeenth century, the direct motion is said to be *in consequentia*, and the retrograde *in antecedentia*. The most simple way of remembering direct motion, is by recalling to mind the order of the signs of the zodiac. From Aries into Taurus, from Taurus into Gemini, &c., up to from Pisces into Aries, is direct motion; while from Taurus into Aries, from Aries into Pisces, &c., is retrograde motion.

DIRECTION, a relative term, not otherwise definable than by pointing out what constitutes sameness and difference of direction. Any two lines which make an angle point in different directions; a point moving along a straight line moves always in the same direction. Permanency of direction and straightness are equivalent notions. A body in motion not only changes its direction with respect to other bodies, but also the direction of other bodies with respect to it.

The most common measure of direction, for terrestrial purposes, refers to the north as a fixed direction, and uses the points of the compass. But any line whatever being drawn from the point of view, the directions of all other points may be estimated by measuring the angles which lines drawn from them to the point of view make with the standard line.

When a point describes a curve, it cannot at any one moment be said to be moving in any direction at all; for upon examining the basis of our notion of curvature, we find that it consists in supposing a line to be drawn, no three contiguous points of which, however near, are all in the same straight line. But this is a mathematical notion, which is contradicted in practice by any attempt at a curve which we can make on paper. For it is found that, as must be the case from the proposition mentioned in the article *ARC* (vol. ii., p. 256), when two points of a curve are taken very near to each other, and joined by a chord, the widest interval between the chord and the arc disappears or becomes imperceptible long before the chord and arc disappear. Hence arises the notion that a curve may in fact be composed of very small straight lines, each of which has of course a definite direction. But though such notion must be abandoned in geometry, yet it leads to the stricter notion of a **TANGENT** [see also **CONTACT**], or of a straight line of which, as soon as the term is explained, we unhesitatingly

admit: 1. That if a line moving on a curve be said to have a direction at all at any point, the direction must be that of a tangent at that point; 2. That it is highly convenient to say that a point moving in a curve is moving in a *continually varying* direction. Here, as in other cases [*VELOCITY, CURVATURE, &c.*], we obtain exactness by making definitions drawn from the inexactness of our senses apply, not to the notions which first gave them, but to the final limit towards which we see that we should approach if our senses were made more and more exact; but which, at the same time, we see that we should never reach as long as any inexactness whatsoever remained.

DIRECTOIRE EXECUTIF was the name given to the executive power of the French republic by the constitution of the year 3 (1795), which constitution was framed by the moderate party in the National Convention, or Supreme Legislature of France, after the overthrow of Robespierre and his associates. [**COMMITTEE OF PUBLIC SAFETY.**] By this constitution the legislative power was entrusted to two councils, one of five hundred members, and the other called '*des anciens*,' consisting of 250 members. The election was graduated: every primary or communal assembly chose an elector, and the electors thus chosen assembled in their respective departments to choose the members for the legislature. Certain property qualifications were requisite for an elector. One-third of the councils was to be renewed every two years. The Council of Elders, so called because the members were required to be at least forty years of age, had the power of refusing its assent to any bill that was sent to it by the other council. The executive power was entrusted to five directors chosen by the Council of Elders out of a list of candidates presented by the Council of Five Hundred. One of the five directors was to be changed every year. The directors had the management of the military force, of the finances, and of the home and foreign departments; and they appointed their ministers of state and other public functionaries. They had large salaries, and a national palace, the Luxembourg, for their residence, and a guard.

The project of this constitution having been laid before the primary assemblies of the people was approved by them. But by a subsequent law the Convention decreed that two-thirds of the new councils should be chosen out of its own members. This gave rise to much opposition, especially at Paris, where the sections, or district municipalities, rose against the Convention, but were put down by force by Barras and Bonaparte on the 13th Vendémiaire (4th of October, 1795). After this the new councils were formed, two-thirds being taken out of the members of the Convention, and one-third by new elections from the departments. The councils then chose the five directors, who were Barras, La Réveillère-Lépaux, Rewbell, Letourneur, and Carnot; all of whom, having voted for the death of the king, were considered as bound to the republican cause. On the 25th of October the Convention, after proclaiming the beginning of the government of the laws, and the oblivion of the past, and changing the name of the Place de la Révolution into that of Place de la Concorde, closed its sittings, and the new government was installed. Its policy was at first moderate and conciliatory, but it stood exposed to the attacks of two parties, the royalists, including those who were attached to the constitutional monarchy of 1791, and the revolutionists, or jacobins, supported by the mob. In September, 1796, a conspiracy of the latter, headed by Babeuf, who proclaimed '*the reign of general happiness and of absolute democracy*,' proposing to make a new and equal distribution of property, made an attack on the Directory, which was repulsed by the guard, and Babeuf and other leaders were tried, condemned, and executed. By the elections of May, 1797, for a new third of the members of the councils, the royalists of various shades obtained many seats in the legislature. The policy of the Directory, both domestic and foreign, was now strongly censured in the councils, who asked for peace and economy, and for a repeal of the laws against the emigrants and the priests. The conduct of Bonaparte towards Venice was animadverted upon. Camille Jordan, a deputy from Lyon, made a speech in favour of the re-establishment of public worship. The club of Clichy was the place of meeting of the partisans of the opposition. Barthelemy, who had been meantime appointed director, inclined to the same side, as well as General Pichégu, Barbé Marbois, and others. Carnot, another director, endeavoured to mediate between the two

parties, but to no effect. The Directory being alarmed, called troops to the neighbourhood of Paris, which was an unconstitutional measure. At length Augereau came with a violent message from Bonaparte and the victorious army of Italy, offering to march in support of the Directory, and threatening the disguised royalists in the councils, meaning the opposition. This was the first direct interference of the armies in the internal affairs of France. The majority of the Directory, consisting of Barras, Rewbell, and La Réveillère-Lépaux, appointed Augereau military commander of Paris, who surrounded the hall of the councils, arrested Pichégu, Willot, Ramel, and prevented by force the other opposition members from taking their seats. The remainder of the members being either favourable to the Directory, or intimidated, appointed a commission which made a report of some conspiracy, and a law of public safety was quickly passed, by which two directors, Barthelemy and Carnot, and fifty-three members of the councils, were exiled to French Guiana. Carnot escaped to Germany, but Barthelemy was transported. The Directory added to the list the editors of thirty-five journals, besides other persons. Two new directors, François de Neufchâteau and Merlin de Douai, were chosen in the room of the two proscribed. This was the coup d'état of Fructidor (September), 1797. There was now a partial return to a system of terror, with this difference, that imprisonment, transportation, and confiscation of property, were substituted for the guillotine. The laws against the priests and emigrants were enforced more strictly than ever. By a law of the 30th of September, 1797, the public debt was reduced to one-third, which was called consolidated, and was acknowledged by the state, the creditors receiving in lieu of the other two-thirds bonds, or bills which could only be employed in the purchase of national property, and which fell immediately to between 70 or 80 per cent. Forced loans, confiscations, and the plunder of Italy, were the chief financial resources of the government. The paper money had lost all value. [**ASSIGNATS.**] Government lotteries, which had been abolished by the Convention, were re-established by the Directory. A ministry of police was created, which interfered with the locomotion of individuals, by requiring passports and cartes de sûreté, and made arrests and domiciliary visits under pretence of suspicion. The periodical press was arbitrarily interfered with. In the midst of all this the Directory was mainly supported by the influence of Bonaparte's Italian victories, followed by the peace of Campoformio with Austria. But an act which threw the greatest obloquy upon the Directory was its unprovoked invasion of Switzerland in 1798. Carnot, from his exile in Germany, was loud in his denunciations of this political crime, which he said '*verified the fable of the wolf and the lamb*.' The republicans in the interior were also greatly dissatisfied with the directorial dictatorship, and as by the new elections of 1799 they mustered strong in the councils, they openly assailed the government, which was no longer supported by the presence of Bonaparte, then in Egypt. At the same time a new coalition was formed against France, consisting of Austria, Russia, England, and Turkey, and the French armies met with great reverses both in Italy and on the Rhine. In one short campaign they lost all Italy except Genoa. All this added to the unpopularity of the Directory, which that year consisted of Barras and La Réveillère-Lépaux, both of the first nomination, and Treillard, Merlin de Douai, and Sieyès. The councils demanded the dismissal of Treillard on the score of informality in his nomination, and of La Réveillère and Merlin de Douai on account of several charges which were preferred against them. All the three gave in their resignation, and were replaced by Gohier, Roger Ducos, and Moulin, three obscure men. This change took place in June, 1799. At the same time the councils circumscribed the authority of the Directory, re-established the supremacy of the legislature, and removed the restrictions on the press. But soon after, July 1799, they passed a measure worthy of the worst times of the revolution. This was the '*law of hostages*,' by which the relatives of the emigrants, the ex-nobles, priests, &c., were made answerable for any revolts or other offences against the republic, and liable to imprisonment at the discretion of the local authorities, sequestration of their property, and even transportation. The authority of the Executive Directory had now become very weak, and the councils themselves began to be divided between the violent republicans or jacobins, who were for

measures of terror, and the moderate republicans who wished to act legally according to the constitution of the year III. The policy of the government was consequently vacillating. Talleyrand, the minister for foreign affairs, gave in his resignation. All parties had exhausted themselves by ineffectual struggles, while the mass of the people stood passive, being weary of agitation: this general prostration prepared the way for Bonaparte's ascendancy in the following Brumaire, when the constitution of the year 3 and the Directory were overthrown, after four years' existence. The principal charges against the Directory are stated under the head **BARRAS**. See also *Histoire du Directoire Exécutif*, 2 vols. 8vo., Paris, 1802. The law of the conscription was passed under the administration of the Directory.

DIRECTRIX. (*Linea directrix*, a directing line.) This term is applied to any line (straight or curved) which is made a necessary part of the description of any curve, so that the position of the former must be given before that of the latter is known. Thus in the question, 'required the curve described by a point in a straight line the two ends of which must be on two fixed straight lines,' the two fixed lines are directrices. Custom has sanctioned the special application of this term to lines connected with a few curves, and particularly with the ellipse, hyperbola, and conchoid of Nicomedes. But in reality, with the exception of the circle, there can be no curve which is without one or more lines to which the name of directrix might be given.

DIRGE, in music, a hymn for the dead, a funeral song. This word is a contraction of *Dirige*, the first word of the antiphona, 'Dirige, Domine Deus,' chanted in the funeral service of the Catholic church. The abbreviation seems to have crept into use about the middle of the sixteenth century.

DISABILITY (Law), an incapacity in a person to inherit lands or enjoy the possession of them, or to take that benefit which otherwise he might have done, or to confer or grant an estate or benefit on or to another. All persons who are disabled from taking an estate or benefit are incapable of granting or conferring one by any act of their own, but many persons who are by law incapable of disposing of property may take it either by inheritance or gift.

Disability is ordinarily said to arise in four ways: By the act of the ancestor; by the act of the party himself; by the act of the law; or by the act of God.

By the act of the ancestor, as where he is attainted of treason or murder, for by attainder his blood is corrupted, and his children are made incapable of inheriting. But by the stat. 3 and 4 W. IV., c. 106, § 10, this disability is now confined to the inheriting of lands of which the ancestor is possessed at the time of attainder: in all other cases a descent may be traced through him.

By the act of the party himself, as where a person is himself attainted, outlawed, &c., or where, by subsequent dealings with his estate, a person has disabled himself from performing a previous engagement, as where a man covenants to grant a lease of lands to one, and, before he has done so, sells them to another.

By the act of law, as when a man, by the sole act of law without any default of his own, is disabled, as an alien born, &c.

By the act of God, as in cases of idiocy, lunacy, &c., but this last is properly a disability to grant only, and not to take an estate or benefit—for an idiot or lunatic may take a benefit either by deed or will.

There are also other disabilities known to our law, as infancy, and coverture; but these also are confined to the conferring of interests.

Married women, acting under and in conformity to Powers, and formerly by fine, but, since the 3rd and 4th W. IV., c. 74, by deed executed under the provisions of that statute, may convey lands; and infants, lunatics, and idiots, being trustees, and not having any beneficial interest in the lands vested in them, are by various statutes enabled to dispose of them under the direction of the Court of Chancery.

Particular disabilities also are created by some statutes; as, for instance, Roman Catholics, by the 10 Geo. IV., c. 7 (the Emancipation Act), are disabled from presenting to a benefice; and foreigners (although naturalized) cannot hold offices, or take grants of land under the crown. [DENIZEN.] (Cowel's *Interp.*; *Termes de la Ley*.)

DISBUDDING, in horticulture, consists in removing the buds of a tree before they have had time to grow into

young branches. It is a species of pruning which has for its object not only training, but also economy with regard to the resources of a tree, in order that there may be a greater supply of nourishment for the development of those buds which are allowed to remain.

If the roots are capable of absorbing a given quantity of nutritive matter for the supply of all the buds upon a stem, and if a number of those buds be removed, it must be evident that those which remain will be able to draw a greater supply of sap and grow more vigorously than they otherwise would have done. This fact has furnished the idea of disbudding.

This kind of pruning has been chiefly applied to peach and nectarine trees, but the same principle will hold good with all others of a similar description, and might be practised upon them if they would repay the labour so expended.

The French gardeners about Montreuil and in the vicinity of Paris have carried this practice to a great extent, and with considerable success.

Several of their methods have been described by Dr. Neill, the secretary of the Caledonian Horticultural Society, in his horticultural tour. In one of them, termed *à la Sieulle*, and invented by Sieulle, gardener at Vaux Prasin, near Paris, the training is made to depend entirely upon the exactness of disbudding.

The peculiarity of Sieulle's method is as follows:—After the stock has been budded, two branches are trained at full length to a trellis or wall: late in autumn or in winter all the buds, with the exception of four on each shoot, are neatly cut out, or disbudded; these four in their turn form shoots in the succeeding summer, which are cut down to about one-third of their length in autumn, and also disbudded in the same manner as the two principal branches of the preceding year. This kind of pruning being always performed prevents a superfluous development of buds and the consequent necessity of cutting them out as branches in the following season. Du Petit Thouars, whose opinions are entitled to much respect, passes a high eulogium upon this system of Sieulle: he says, 'by this method the young tree is more quickly brought to fill its place upon the espalier; it is afterwards more easily kept in regular order: many poorer flower-buds are allowed to develop themselves, but the necessity of thinning the fruit is thus in a great measure superseded, and the peaches produced are larger and finer.'

Dumoutier's system of disbudding is somewhat different from Sieulle's. Instead of performing this operation late in autumn, he defers it until spring, when the buds are unfolded: all those upon the young shoot of the previous year, with the exception of the lowest and the one above the highest blossom, are then carefully removed; of the two which are left, the first is termed the *bourgeon de remplacement* for the next year, and the latter is allowed to remain to draw up the sap for the maturing of the fruit. This method of pruning, as far as disbudding is concerned, is precisely the same as that practised by Seymour, of Carleton Hall, in England.

It must not be thought however from this statement that the training of Dumoutier and Seymour is the same, or that their trees assume precisely the same appearance: for example, Dumoutier's branches proceed from two principal arms, Seymour's from one in the centre: in the system of the former, the fruit-bearing branches are on both sides of the old wood; while in that of the latter they are only allowed to grow from the upper sides.

Disbudding in spring is frequently and beneficially practised by many intelligent gardeners, both in England and Scotland, upon English fan-trained peach-trees, with a view to thinning the young wood, taking care to leave enough for the production of fruit in the following year.

When spurious buds can be removed from peach or nectarine trees before development, with the certainty of those succeeding which are allowed to remain, it must be of material consequence, as the latter will not only be better supported, but will also receive a greater quantity of light, so essential to mature and ripen the young wood. Unfortunately however Sieulle's plan cannot be practised with any degree of success in England: those buds which are left, and upon which so much dependence is placed, often do not grow; a vacancy is the consequence, and the tree is deformed. The climate of Montreuil is much more favourable to the growth of the peach-tree than that of Britain, and although the winters of Paris are severe, yet the mean

degree of summer heat is much greater there than in any part of England; and perhaps the peculiar nature of the soil renders peach-trees much more yielding to art there than in this country.

For these reasons, however useful the plan of disbudding in autumn or winter may be in the gardens of France, it would be improper to practise it to any extent in those of England. The system has been fairly tried in the garden of the London Horticultural Society, but has long since been discontinued.

It has however been proved, both there and from the long experience of men in private situations, that a judicious thinning of the buds after they have been unfolded in spring (when an experienced individual can foresee the strength of those which he is about to leave, and to which he looks for his fruit in the following year), is of great utility.

DISC (*discus, discus*), is used for the face of a circular plate, and frequently for a thin plate of any substance. Thus we speak of the sun's disc (referring to the appearance of the sun), and also of a disc of metal.

DISCIPLINE, MILITARY, the series of duties which are to be performed by military men. It also signifies a conformity to the regulations by which those who serve in the army are governed in all matters relating to the practice of their profession.

DISCLAIMER (Law), a plea by a tenant in any Court of Record in which he disclaims to hold of his lord. This disclaimer of tenure is a forfeiture of the lands to the lord upon reasons most apparently feudal. And so likewise if in any Court of Record the particular tenant does any act which amounts to a virtual disclaimer, as if he claims a greater estate than was granted to him, or takes upon himself those rights which belong only to tenants of a superior class, or if he affirms the reversion to be in a stranger, by attorning as his tenant, collusive pleading, and the like, such behaviour amounts to a forfeiture of his particular estate. The writ of right sur disclaimer was the old form in which the lord took advantage of the forfeiture; but as it was decided that the tenant might be treated as a trespasser, and that notice to quit was not necessary, the more convenient action of ejectment was generally used, and now, since the stat. 3 & 4 W. IV., c. 27, the proceeding by writ of right sur disclaimer is abolished.

Where a person by his plea denied that he was of the blood of another, he was also said to disclaim; and there is a disclaimer of goods as well as lands, as where on an arraignment of felony a man disclaims the goods, in which case, though he should be acquitted, he loses the goods.

One of the pleadings in a suit in Chancery is also called a disclaimer, as where a defendant, in his answer to the complainant's bill, disclaims all interest in the matter in question. [EQUITY.]

And where an estate is given either by deed or will to a person, he may by deed (which need not be enrolled, or, as it is called, made matter of record) disclaim all interest thereunder; but it seems that for this purpose a deed is necessary, and that a parol disclaimer would not be sufficient.

An executor is said to disclaim when he renounces probate of the will of his testator; and this is generally effected by verbal renunciation before some judge spiritual, or by simple writing under his hand, in either case the disclaimer being recorded in the spiritual court; but where the will contains a devise of lands to the executor, the disclaimer is generally made by deed, for although a disclaimer by the before-mentioned means would, it seems, be operative, yet the deed is preferred as affording evidence, in deducing a title to the lands, of the fact of disclaimer.

DISCONTINUITY (Algebra, &c.). Continuous changes are those which are so made that no two states exist without every possible intermediate state having been in existence between them. Thus the square on a line of 4 inches contains 16 square inches, while that on a line of 5 inches contains 25 square inches; and there is no possible area between 16 and 25 square inches which is not equal to the square described on some line between 4 and 5 inches. That is, if a straight line increase continuously, the square described on it increases continuously.

The first introduction of discontinuity arises from the attempt to represent all magnitudes by numbers. Arithmetical symbols cannot represent continuous change of magnitude. If a foot be divided into 2, 3, 4, &c. equal parts, and so on *ad infinitum*, there exist infinite numbers of lengths which will not be represented by any whatsoever of the

sulting fractions of a foot. Hence the difficulties of INCOMMENSURABLE magnitudes, which arise from the failure of the attempt to represent flowing or continuous changes by the means of changes which always suppose finite intervals, as in passing from number to number.

But the arithmetical difficulty, being introduced antecedently to the express consideration of discontinuity, is rarely treated as belonging to this subject. In the higher parts of mathematics the necessity for the consideration of discontinuous expressions began with the investigation of partial differential equations. In the introduction of the arbitrary functions which those equations require, discontinuous functions were thought to be admissible by Euler, an opinion which was controverted by D'Alembert, and supported, conclusively, it has always been thought, by Lagrange. It is our own opinion that not only the arbitrary function of a partial equation, but even the arbitrary constant of a common equation, may be allowed to be discontinuous, unless the contrary be a condition of the problem, expressed or implied. By a discontinuous constant, we mean one which preserves one value between certain limits of the value of the variable, which then suddenly changes its value, preserving the new value till the variable attains another limit, and so on.

The subject has begun to force itself on the attention of mathematicians, and several remarkable cases have been pointed out in which erroneous conclusions have been arrived at for want of considerations connected with discontinuity. There is a full account of the state of this question in Mr. Peacock's 'Report on Analysis.' (*Rep. Brit. Ass.*, 1834.)

DISCORD, in music, a sound which, when heard with another, is disagreeable to the ear, unless treated according to the rules of art. Discords are the 2nd, sharp 4th (Tritone), flat 5th (Semidiapente), minor or flat 7th, and major or sharp 7th. The ratios of these are 9 : 8, 45 : 32, 64 : 45, 9 : 5, and 15 : 8. The 9th (9 : 4) is also a discord, and though only the octave to the 2nd, is considered in harmony as a very different interval, and treated in a different manner. The 4th (4 : 3) is either discord or concord, according to the manner in which it is accompanied. [CONCORD.] Discords commonly, but not always, are prepared; i. e., the note which is to become the discord, is first heard as a concord: and their resolution is absolutely necessary: i. e., the discord must pass into a concord, though the resolution is occasionally retarded. Examples:—

The perfect 5th in the chord of $\frac{3}{2}$, and the 3rd in the chord of $\frac{4}{3}$, are treated, so far as regards resolution, as discords. Examples —

DISCOUNT, a sum of money deducted from a debt in consideration of its being paid before the usual or stipulated time. The circumstance on which its fairness is founded is, that the creditor, by receiving his money before it becomes due, has the interest of the money during the interval. Consequently, he should only receive so much as, put out to interest during the period in question, will realize the amount of his debt at the time when it would have become due. For instance, 100*l.* is to be paid at the end of

three years, what should be paid now, interest being 4 per cent. Here it is evident that if we divide the whole debt into 112 (or $100 + 3 \times 4$) parts, 100 of these parts will make the other 12 in three years (at simple interest), whence the payment now due is the 112th part of 10,000*l.* or 89*l.* 5*s.* 9*d.* The rule is, n being the number of years (a fraction or number and fraction), r the rate per cent., and D the sum due,

$$\text{Present value} = \frac{100 D}{100 + nr}; \text{discount} = \frac{Dnr}{100 + nr}$$

In practice, it is usual not to find the real discount, but to allow interest on the whole debt in the shape of abatement. Thus it would be considered that, in the preceding example, three years' discount upon 100*l.* at 4 per cent. is 12*l.*, or 88*l.* would be considered as the present value.

In transactions which usually proceed on compound interest, as in valuing leases, annuities, &c., the principle of discount is strictly preserved. The present value in the preceding case is, in its most usual form,

$$\frac{D}{(1 + \rho)^n} \text{ and the discount } D - \frac{D}{(1 + \rho)^n};$$

where ρ is the rate per pound (not per cent.: thus it is '04 for 4 per cent.). But recourse is usually had to the tables of present values which accompany all works on annuities or compound interest. [INTEREST.]

The name of discount is also applied to certain trade allowances upon the nominal prices of goods. In some branches of trade these allowances vary according to the circumstances which affect the markets, and what is called discount is in fact occasioned by fluctuations in prices which it is thought convenient to maintain nominally at unvarying rates. This system is practised in some branches of wholesale haberdashery business, and we have now before us a list of prices furnished to his customers by a manufacturer of tools at Sheffield, in which the nominal price of each article is continued the same at which it has stood for many years, while to every different species of tool there is applied a different and a fluctuating rate of discount, this fluctuation constituting in fact a difference of price between one period and another: the rates of discount in this list vary from 5 to 40 per cent. upon the nominal prices of the different articles.

The term discount is also employed to signify other mercantile allowances, such for example, as the abatement of 12 per cent. made upon the balances which underwriters, or insurers of sea risks, receive at the end of the year from the brokers by whom the insurances have been effected. The word discount is further used, in contradistinction to premium, to denote the diminution in value of securities which are sold according to a fixed nominal value, or according to the price they may have originally cost. If, for example, a share in a canal company upon which 100*l.* has been paid is sold in the market for 98*l.*, the value of the share is stated to be at 2 per cent. discount.

DISCOVERY, in Law. [EQUIVY.]

DISCUS (*δίσκος*, *discos*), a quoit of stone, brass, or iron, with which the Greeks and Romans diverted themselves in the public games. The word is Greek. The discus, when perforated like our modern quoit, was thrown by the help of a thong, put through the middle of it. It was at other times of a solid piece, and was then hurled directly from the hand. This last method is illustrated by the celebrated statue of the Discobolus, or quoit thrower, attributed to Myro, an antique copy of which is among the marbles of the Townley Gallery. The figure is represented in action at the precise moment of delivering the discus. Ovid (*Metam.* li. x., v. 175) and Statius (*Theb.* vi., v. 646) have both described the diversion of the discus; see also Petri Fabri *Agonisticon, sive de Re Athletica, Ludisque Veterum*, 4to., Lugd. 1595, li. ii., c. i.

The term discus was likewise applied to circular shields or bucklers, of a large size, placed in the temples, on which great actions were represented, or the names of those who had devoted themselves to the service of their country inscribed. One of the former of these is in the Townley Gallery at the British Museum, Room iii., No. 36, containing the names of the ephēbi of Athens under Alcmenes, when he held the office of cosmetes. Such too was the shield of Scipio Africanus, found in the Rhone in 1656, engraved in Spon's 'Miscellanea Eruditæ Antiquitatis,' edit. 1685, p. 152. Anacreon has an ode on a disk of silver, representing Venus rising from the sea: Od. 51,

Εἰς Δίσκον ἔχοντα Ἀφροδίτην. See likewise Montfaucon, *Supplém. de l'Ant. Expliq.*, liv. iii., p. 64.

DISDIAPA'SON, the name given by the Greeks to a scale of two octaves. [DIAPASON.]

DISK, a term in botany signifying any ring or whorl of glands, scales, or other bodies that surround the base of an ovary, intervening between it and the stamens. In its most common state it is a fleshy wax-like ring as in the orange; it frequently forms a yellowish lining to the calyx, as in the plum and cherry, and not unfrequently rises up like a cup around the ovary as in the tree pæony. The latter renders it probable that the disk is nothing but an inner whorl of rudimentary stamens. Previously to the expansion of the flower the disk contains fæcula, and is dry and brittle; but after the blossom unfolds it perspires a sweet honey-like fluid, and becomes tough, absorbing oxygen and parting with carbonic acid. This phenomenon is similar to what occurs in the germination of seeds, and has led M. Dunal to the opinion that the conversion of the fæcula of the disk into sugar is for the purpose of forming a store of nutritive matter for the stamens and ovary at the time of fertilization, just as the same phenomenon in the germination of seed is for the purpose of supplying food to the young embryo.

DISLOCATION. Various parts of the body are liable to be displaced by the direct application of violence or by more gradual causes. But the term *dislocation* is commonly appropriated to displacements occurring about the joints. In this sense it is nearly synonymous with *luxation*, but not entirely; for the latter term carries with it more of the idea of external force, and is not quite so generally applied. It is usual, for instance, to speak of the *dislocation*, not the *luxation*, of the internal cartilage of the knee; and the latter term is seldom if ever used in describing the displacements of the small bones of the wrist or instep, or of single vertebrae.

The injuries classed under this title may be effected by external violence, or by the undue contraction of muscles, or by both of these causes combined; and they result in some instances from disease within the joints themselves, by which their ligaments are weakened or destroyed, and their sockets rendered insecure by ulceration and other gradual changes.

When, by the protrusion of the bone through the skin or otherwise, the dislocation is complicated with an external wound exposing the cavity of the joint, it is said to be *compound*: and, as in the parallel case of fracture, this aggravation of the injury is very serious, and the most skilful management is required to save the life or limb; where the injury happens to one of the larger joints.

The particular dislocation takes its name either from the joint itself or from the furthest bone; and various terms are added to indicate the direction of the displacement, or the new situation of the head of the bone. Thus the most common form of the accident at the hip is called 'a dislocation of the head of the *femur*' (thigh-bone) '*backwards* upon the *dorsum ilii*' (flat part of the haunch-bone).

Any bone may be displaced in any direction, but the accident happens most frequently in those joints and directions in which the extent of motion is the greatest. Thus the most common dislocation is that of the shoulder, which is the most movable joint; and its most frequent variety is that in which the head of the *humerus* (or bone of the upper arm) is drawn downwards into the *axilla* (or arm-pit) by the sudden contraction of certain strong muscles. This happens when the arm is raised to the utmost, as in reaching to close a window; that is when it has moved through an angle of 180° degrees from its natural position. The most usual dislocation of the hip is that, already mentioned, on the *dorsum ilii* for the same reason. It is generally produced by sudden pressure or a blow on the knee when the thigh is bent upon the abdomen; the head of the *femur* is thus driven backwards from the socket, and is then drawn farther back and upwards by the powerful muscles of the buttock.

The jaw is sometimes thrown out of joint by the mere act of yawning; and that accident happened to a gentleman known to the writer in opening his mouth to make the usual response at church. The word was cut short at the first syllable; for in such cases the chin suddenly drops and is thrown forward, and it is impossible by any effort to shut the mouth. This distressing but irresistibly ludicrous accident may be relieved immediately by any bystander wrapping a napkin round his thumbs and placing

them firmly against the back teeth, so as to press them downwards, while with the fingers and palms the chin is steadily raised and pushed backwards. But the operator should be on the alert to withdraw his hands the moment the jaw snaps back into its place, or he may receive a very unpleasant intimation of the success of his efforts.

It will be easily seen from these instances how important a part is played by the muscles in determining both the occurrence and direction of these accidents. Hence arises in part their infrequency, often wondered at, during infancy and childhood; for though the flexible joints of the young have a greater extent of motion than those of the adult, their muscular power is not only weaker as compared with the strength of their ligaments, but is much more tardily thrown into action, as may be observed in their tottering gait. The fragility of their bones is another cause of this infrequency, by rendering them more liable to be broken than displaced by external violence. The only dislocation that is at all common in children is that of the hip, which is the consequence of scrofulous ulceration of the ligaments and the socket, and of the ball-shaped head of the femur within it.

The reader will be prepared by what has been said to learn that the spasmodic and violent contraction of the muscles consequent upon these displacements is the chief or only obstacle to their reduction.

This object is effected by a process technically called *extension*, consisting in the application of force in a proper direction, and steadily kept up till the muscles are fatigued. The head of the bone is thus drawn down a little below the level of the joint; and being lifted over the edge of the socket, slips easily into its place upon slightly relaxing the extending force. This force is often required to be very considerable, and in such cases it is customary to make use of a block of pulleys, the bone which contains the socket having been first securely fixed to a staple in the wall by proper bandages. Luxation of the hip is here supposed; for the other joints are so inferior to that in strength that their displacements may generally be reduced by less imposing means. It is sometimes necessary to favour the relaxation of the muscles by emetics, warm baths, and bleeding, and it is reckoned a point of good management to call off the attention of the patient during the extension by annoying him with questions and even exciting him to anger.

Almost all dislocations arising from accident may be reduced in this way, and the joint rendered nearly or quite as perfect as before: but this can only be done on condition of perfect rest during a period sufficient for the firm union of the ruptured ligaments; for if this precaution be not strictly observed, and the ligaments are suffered to be stretched by motion while the uniting substance is soft and extensible, the accident is ever afterwards liable to recur. No time should be lost in seeking assistance, for the swelling that comes on soon renders the nature of the accident obscure, and the reduction extremely difficult and painful. When a joint has been unredressed for a certain time, which varies with the particular joint, and with the bodily strength of the individual—the weaker having the advantage in this respect—it is unwise to make any attempt at reduction. The parts have now become consolidated and adapted to their new situation, and either the limb is permanently fixed or a new joint is under process of formation. In the latter case the substitute is often better than might be expected; and as this curious provision of nature cannot be improved upon by art, it is better to leave it alone.

The most dangerous dislocations are those of the vertebrae or bones of the spine, because in that case all the parts of the body below the injury are paralyzed. But the vertebrae are so curiously locked together, and have singly so little motion, and are at the same time so well supported by ligaments and muscles, that they are seldom dislocated unless by a force sufficient to break as well as to displace them. Such an injury is almost always fatal, and instantly so in general when it takes place above the origin of the nerves of respiration, that is, above the fourth vertebrae of the neck. The object of the executioner in hanging a criminal is to produce this effect, but he more often fails than succeeds.

It would be out of place in this work to describe the various dislocations more particularly. The reader will find some additional information on the subject under the head of JOINTS. The best English treatise upon it is the large work of Sir Astley Cooper.

DISMAL SWAMP. [CAROLINA, NORTH; VIRGINIA.]

DISPART, the difference between the semidiameter of the base ring, at the breech of a gun, and that of the ring at the swell of the muzzle.

On account of the dispart, the line of aim, which is in a plane passing through the axis of the gun, always makes a small angle with the axis; so that the elevation of the latter above the horizon is greater than that of the line of aim: an allowance for the dispart is consequently necessary in determining the commencement of the graduations on the tangent scale, by which the required elevation is given to the gun.

DISPENSARY, an institution supported by voluntary contributions for the supply of the poor with medical and surgical advice, and with medicines gratuitously. Institutions of this kind are of very recent origin. They differ from hospitals in this, that the sick, when too ill to attend personally at the institution, are visited at their own homes by the medical officers of the charity. Each dispensary indeed is restricted to a certain district, beyond the limits of which the patients are not visited at their own houses. To every dispensary there are always attached one, and sometimes two physicians; one surgeon, and often a consulting surgeon, and a resident medical officer who dispenses the medicines prescribed by the physicians and surgeons. Every subscriber to the institution who pays annually a certain sum is called a governor, who is entitled to have at least one patient always on the books; a person who subscribes a larger amount in one sum is called a life-governor, who may have two or more patients on the list. The medicines, which are commonly purchased in considerable quantities at a time and at wholesale prices, are dispensed in unexpensive forms, and in this manner the extent of the relief afforded is great, while the cost is trifling. No other kind of charity affords so much real assistance at so small an expense, and perhaps fewer objections apply to this than to any other mode of giving eleemosynary aid to the poor. Its peculiar excellence is that it enables the sick poor to obtain advice on the very first day of their illness. Even the great metropolitan hospitals are often so full that urgent cases are constantly obliged to wait days and even weeks before admission can be obtained; but by means of the dispensary poor families, and even the heads of such families in regular employment, may procure medical and surgical assistance without leaving their occupation even for a day. It would be a great improvement in the principle of these institutions if some contribution towards their support on the part of the poor themselves were required to entitle them to avail themselves of the advantages which they afford. This would remove the only objection that can be urged against such establishments, and would enable the independent labourer, without asking charity, to procure the best advice for his sick family at a much cheaper rate than he can possibly do at present.

DISPENSATION (Law). The only kind of dispensation now used is that by which the bishop of a diocese licenses a clergyman within his jurisdiction to hold two or more benefices according to their value, or to reside out of the bounds of his parish, or dispenses with some other particular of his strict duty.

Formerly, not only in ecclesiastical jurisprudence, but also in the civil and criminal codes, the subject of dispensations occupied a large space. They formed a great source of the revenue of the court of Rome; for the pope's dispensations prevailed against the law of the country in many if not most instances, indeed in all of an ecclesiastical nature; this abuse was however abolished by the statute 25 Henry VIII., c. 21; and the power of the pope to grant dispensations not contrary to the law of God, but only to the law of the land, was granted to the archbishop of Canterbury under certain restrictions. It is hardly necessary to state that from the spirit of the times this power is never exercised in civil cases, and but in a few cases of purely ecclesiastical cognizance, and in those the usage has become the law rather than the exception. This right of the archbishop in some cases, as to grant special licences of marriage, &c., has been expressly recognized by the legislature.

Formerly also the crown claimed a dispensing power, by which it could exempt a person from the ordinary liabilities to the laws of the realm: the limits of this power were never exactly defined, but in consequence of the gross abuse of it during the reign of James II., it was expressly abolished

by the Bill of Rights on the accession of William and Mary.*

DISPERSION. Light, as we receive it from the sun or from other original sources as a star, a fire, a candle, &c., appears to the senses as a simple undecomposable element by the instrumentality of which objects are perceived; and as for the peculiar colours of bodies, we naturally consider them, according to our early impressions, as belonging to the bodies themselves, or inherent in them. We are partly undeceived in this view by the changing colours of birds' feathers, soap-bubbles, compound silk textures, &c., but we are enabled to trace the immediate cause of the colours of bodies, whether permanent or transient, by the analysis of light furnished by the well-known experiments of the glass-prism.

The triangular prism used for this purpose is a solid, terminated by two equal and exactly similar triangles, and having besides three plane faces of a rectangular form, contained by the sides of the triangles and by right lines or edges joining corresponding angles of the two triangular bases above-mentioned; and any imaginary right line within it parallel to these edges around which the prism is capable of revolving is called the *axis of the prism*.

In the annexed figure the triangle BAC represents a section of the prism parallel to its basis or perpendicular to its axis. DE we shall suppose to be a ray or exceedingly narrow beam of solar light incident from *vacuo* or air on the prism at E ; this ray of white light enters the prism at that point, and having undergone refraction by the dense medium of the glass, no longer proceeds as a simple ray EF , but is *dispersed* or divided into various rays of different colours over the space represented in the figure by fEF , and emerging at fF from the prism, undergoes another refraction, such that the portion fG of the ray proceeding from f is still more refracted than the portion FG from F , since the sines of the angles of incidence and refraction being in a constant ratio, that portion will be most refracted which has the greatest incidence: let now this dispersed beam $gfFG$ be intercepted by a screen or wall PK , and from which extraneous light is as much as possible excluded, we shall then find the elongated space FG brilliantly painted over with tints passing gradually and insensibly from deep red to an attenuated violet, in the following order, as described by Newton, and since very generally concurred in,—red, orange, yellow, green, blue, indigo, violet. This experiment, which first opens the analysis of light, is easily made by letting a beam of light pass through a small circular hole in a shutter, in a darkened room, on a glass prism such as above described, the refracted and dispersed ray being received on the opposite wall, ceiling, or floor, according to the position of the prism. It would be still more effective by concentrating the light incident on a double convex lens in its focus, so that the beam EF may emanate more nearly from a point than it can when received through the hole of a shutter; for in the latter case rays are admitted which are inclined to each other at the angle subtended by the sun's disc to the eye. This primary experiment is, however, so familiar to almost all amateurs of science, that it will not be here necessary to enter into details respecting its most successful application.

When the image of the sun or a star, candle, &c., is thus formed by admission through a small hole or narrow line, and the refraction of the prism, the coloured space Gg , which has the same angular breadth as the object in a direction parallel to the axis of the prism (the screen being sup-

posed also parallel to it), but which is considerably elongated in the perpendicular direction, is called the *spectrum*; and that angle of the prism BAC the sides containing which BA , AC , have been traversed by the ray $DEFG$ is called the *refracting angle* of the prism.

Suppose, now, that a small orifice O is made in the screen at some point of the spectrum, so that rays of any particular colour, green for example, may be transmitted through it; and let the transmitted portion be again subjected to refraction through another prism, this beam being supposed very small, to ensure its purity or near uniformity of colour. It will not, after refraction, be again decomposed, or undergo any alteration of colour, except in respect to brilliancy, arising from absorption by the second prism: thus showing that light incident on the first prism, when once decomposed into homogeneous elements by refraction, is then, at least by refraction, not further decomposable.

If the original prism BAC be turned gradually round its axis, preserving always to the incident light the same refracting angle A , the spectrum Gg may be made to descend towards K , but after arriving at a certain point where the deviation, that is the inclination of DE produced to FG , is a minimum, it then reascends, and it is usual to make the chromatic experiments in this definite position of minimum deviation. This occurs when the position of the prism is such that the angles of incidence and emergence, or their complements DEB , GFC , are equal; for when the moving point G has reached its lowest place, it is for a moment in the condition of a fixed point like the point D , through which we may suppose the incident beam admitted; hence rays proceeding from D , notwithstanding a small variation of incidence arising from the rotation of the prism, reach G , as if it were a fixed point; and since in dioptrics it is of no consequence to the *path* in what direction we suppose the rays to move, it follows that rays proceeding from G , notwithstanding a small alteration of the angle CFG , would arrive at the fixed point or orifice D ; and consequently the *data* for the determination of the angles DEB , GFC , in the position of minimum deviation, are precisely the same, and therefore these angles must then be equal.

This being premised, the following easy calculus will give the necessary angle of incidence to produce a minimum deviation

Since the angles of incidence and emergence are equal, the angles formed by the interior ray EF with both sides of the prism are equal, or the triangle AEF is an isosceles; let 2α be the refracting angle of the prism, then drawing AM perpendicular to EF , we have $\angle EAM = \alpha$, which, being the complement of AEM , is necessarily the angle of refraction; if therefore μ be the index of refraction for rays of any given colour, the angle of incidence P , corresponding to a minimum deviation, is given by the equation,

$$\sin. (P) = \mu \sin. (\alpha)$$

For distinctness, suppose the preceding index of refraction μ to belong to the extreme red rays, and let μ' be the index for the extreme violet rays of the spectrum; then, if P' denote the angle of incidence corresponding to the minimum deviation of the latter, we have

$$\sin. P' = \mu' \sin. \alpha;$$

and since α is always less than a right angle, and μ' is greater than μ , therefore P' is greater than P . In other words, when the red rays of the spectrum, having arrived at their lowest position on the screen, begin to reascend by the continued rotation of the prism, the violet rays will still descend a little before they arrive at their lowest position. Under these circumstances, the extent of the spectrum contracts from both ends, and an angle of incidence P , intermediate to P and P' , which do not greatly differ, corresponds to the minimum or brightest spectrum; and it

* For the history of this abuse see Prynne's 'Animadversions on the Fourth Institute'; Petyt's 'Jus Parliam.', c. 7; and 'Ladies Tracts,' 327; the 'Birth and Parentage, Rise and Fall, of Nonobstante.'

would be probably useful to observe what class of rays, defined by Fraunhofer's lines, had then obtained their minimum deviation; that is, such whose index of refraction is $\frac{\sin P}{\sin a}$.

We have seen that compound light, the sun's for example, may be decomposed into its homogeneous constituent rays by refraction through a transparent prism. Conversely it may be recomposed into light similar to the original, merely by making the rays, thus separated, by another refraction to occupy the same place. This may be effected by placing a prism of exactly similar material and form to that already used, with its refracting angle turned in a direction opposite to that of the former, so that the near faces of both prisms may be parallel; for the rays entering the second prism are in the same condition as if we supposed their direction inverted, that they may re-pass through the first; and therefore they emerge in a similar compound ray with the original, which may also be easily confirmed by experiment.

The rays issuing from the second face of the refracting prism may also be collected by means of a double convex lens, so as all to meet very nearly in its principal focus, where, if the image be received on a sheet of paper, the original compound light will be reproduced.

When the light of the sky, admitted through a small hole in a shutter in a dark room, is refracted by a prism, if an eye is placed behind the prism in the position which the spectrum would occupy on a screen, the hole will appear of the particular colour of the ray which reaches the eye, changing continually from one colour to another as the eye occupies different parts of the spectrum.

The prismatic analysis of light, together with the phenomena relative to the transmission and absorption of light, enabled Newton to conclude that the colours of natural bodies are not inherent qualities of those bodies, but depend on their powers of reflecting, transmitting, or absorbing the rays of some colours more than others from the compound light incident on them; for all bodies placed in homogeneous light of any colour appear themselves to be of that colour, though the vividness of tint is greatest when placed in that coloured light which they reflect most copiously. Hence also arise the different colours of the liquids exhibited frequently in chemists' shops, according as they are viewed by transmitted or reflected light which would necessarily be complementary colours if no absorption or extinction of light occurred in its passage through the fluid.

Many of the prismatic colours may be imitated by mixing colours taken as in the spectrum of greater and less refrangibility, as orange from red and yellow, &c., but such compound colours are not identical with the homogeneous light of the same colour, being immediately decomposable when viewed through a prism.

It would be difficult, if not altogether impracticable, to judge of the *dispersive powers* of transparent media by measuring the length of the spectra which they produce in a prismatic form, in consequence of the indefiniteness of their *termini*. The light at the violet end is so feeble that it requires some continued application of the eye to perceive a colour where we had first imagined the spectrum terminated; and, on the other hand, the influence of imagination, after we have recognised it, is apt to extend it momentarily far beyond its limits. Fortunately Nature has herself furnished a scale of definite limits in the beautiful discovery made by Wollaston and Fraunhofer of the existence of dark spaces, bands transverse to the length of the spectrum, and now generally designated Fraunhofer's lines.

These bands are best observable by forming the spectrum of a luminous line instead of a point, by means of a prism of great purity, and viewing it through a telescope of good magnifying power, though some of them may, when carefully pointed out, be recognised by the unassisted eye, and after one recognition are in future easily found. They are spaces totally deficient of light, of very unequal width, and exceedingly numerous; the large bands near the extremities of the spectrum serve, however, as definite limits, so as to furnish the requisite criteria for the dispersive powers of different substances; it is also very remarkable that these bands, always the same in number and relative position for the same light, are different when the source of light is varied. Thus sun-light, moon-light, planet-light, sky-light, derived from a common source, have the same lines, but they are different from those of star-light, fire light, candle-light,

&c., each essentially different source having a peculiar system of deficient rays.

Substances which have not a great difference of refractive powers possess frequently very different dispersive powers, and the angular dispersion by a medium is not proportional to the angular deviation, and therefore by a system of prisms, two or more, white light incident on the first may be reproduced from the last, though on the whole refracted from its original direction. Such a system is called *achromatic*.

Conversely, by forming an achromatic system experimentally, where the angles of the prisms are small, and in the position of minimum deviation, if the dispersive power of the material of one of them be taken as a standard, that of the other may be readily obtained, the dispersion being measured by $\frac{\delta\mu}{\mu-1}$, μ being the index of refraction, and $\delta\mu$ the difference of its extreme values for any class of rays. This method has been much used in practice, particularly by Dollond.

The formulæ for achromaticity in systems of prisms or lenses, though not difficult of investigation, are in general too complicated and tedious for a popular work; (see *Mémoires de l'Acad. de Sciences*, 1765; *Mém. par D'Alembert*.)

The rainbow is a beautiful natural exhibition of the dispersion of light into the spectral colours. [RAINBOW.]

To find the longitudinal chromatic aberration of a lens, or the interval of the axis between the foci of extreme red and violet rays:

Let the red rays converge to the point R, and the violet to the point V in the axis.

Let f , F be respectively the focal distances for the given system of rays, and a parallel system; then the fundamental equations for lenses (neglecting their thickness), give $\frac{1}{f} - \frac{1}{F} = \text{constant}$, since the rays of all colours in the compound incident beam have a common origin; now differentiate relative to μ , the variable index of refraction: hence,

$$\frac{df}{d\mu} = \frac{f^2}{F^2} \cdot \frac{dF}{d\mu};$$

but since F is proportional to $\mu - 1$, therefore $\frac{1}{F} \cdot \frac{dF}{d\mu} = \frac{1}{\mu - 1}$; and if $\delta\mu$ denote the total variation of μ from extreme red to violet, and δf the corresponding variation of f , or longitudinal aberration, and finally h , the dispersive power of the medium, we have

$$\delta f = \frac{df}{d\mu} \cdot \delta\mu = \frac{f^2}{F} \cdot \frac{\delta\mu}{\mu - 1} = h \cdot \frac{f^2}{F}.$$

To find, in the same case, the radius of the circle of least chromatic dispersion:

By referring to the same figure, we may observe that the foci R V are respectively the vertices of red and violet conical surfaces, having the lens as a common base. Let these surfaces intersect in a circle, of which the radius is DE; then it is plain that all the intermediate coloured rays pass through this circle. It is therefore that of least dispersion:

The preceding figure, representing a plane section of the whole system taken through the axis, it is obvious that, from the smallness of R V relative to C R, the angles C V B, C R A, are sensibly equal, or the triangle V R D is exceedingly nearly isosceles, and therefore DE bisects V R, or $ER = \frac{\delta f}{2}$, and $DE = ER \cdot \frac{CA}{CR} = \frac{h}{2} \cdot \frac{f}{F} \cdot CA$, and for parallel incident rays $DE = \frac{h}{2} \cdot CA$.

DISSECTION. The art of separating the parts of organized bodies in such a manner as to display their structure

It is an art equally applicable to both divisions of the organic kingdom, and indispensable alike to the discovery of the structure of plants and animals. The grounds on which, for the well-being of the community, every facility should be afforded to the cultivation of this art, as far as regards human dissection, have been already fully stated. [ANATOMY.] It is satisfactory to observe that the prejudices which formerly obstructed this practice are rapidly disappearing, and that even the most uneducated are beginning to appreciate its great importance and its signal utility.

DISSEMIN. [SEISIN.]

DISSENTERS, the general name for the various Protestant religious sects in this country that disagree in doctrine, discipline, or mode of worship with the established church. The Jews and Roman Catholics are not commonly called dissenters. The origin of Protestant dissent from the church of England is usually traced back to the year 1548, in the reign of Edward VI., when a controversy arose among the adherents of the new Reformation in consequence of the excellent Hooper (afterwards the martyr) scrupling to be consecrated as bishop of Gloucester in the customary canonical habit, which he deemed objectionable as a relic of Romanism. Hooper eventually received consecration without being attired in canonicals. At this time the two parties received the names of Conformists and Nonconformists. Very soon after that of Puritans came into use as the general appellation of the dissenters; and it continued to be that by which they were commonly distinguished down to the close of the civil wars in the next century. The toleration of the dissenters, even in the most limited extent, dates only from the Revolution; during the century and a half that elapsed between the Reformation and that event, with the exception only of the short period of the Commonwealth, during which first the Presbyterians and afterwards the Independents had the ascendancy, they continued to be persecuted by a succession of restrictive and penal laws of almost constantly increasing severity. It has taken almost the century and a half more, that has passed since the revolution, to raise the dissenters from being a merely tolerated body to a free participation in the rights of their fellow subjects by the abolition of the Test and Corporation Acts, in 1828. If the relaxation of the marriage law, that has since taken place, shall be followed by the abolition of church rates, the dissenters will be placed as nearly on an equality in all respects with the adherents of the established church as it is possible that they should be, without the established church itself being abolished. In the early times of dissent the great classes of dissenters were the Presbyterians, the Independents, the Baptists, and the Quakers, and they still continue to be the most numerous sects, unless we are to include the Methodists, or followers of Wesley and Whitfield, some of whom are avowedly dissenters, and others not, and are also subdivided into Wesleyan Methodists, Primitive, &c. The minor sects of dissenters now make a long list; but many of them may be considered as only subdivisions of or included in the four leading denominations. From an examination of the best materials (which are however very imperfect) that exist for the statistics of dissent, Mr. Macculloch is inclined to think that the entire number of Protestant dissenters in England and Wales does not exceed 2,200,000, or, at most, 2,500,000, even including the Methodists, who may amount to about 1,200,000. (*Statistical Account of the British Empire*, ii., 413, 416.) But this estimate, we are inclined to think, is too low. The most numerous classes of dissenters in Scotland originated in a separation from the established church in 1740. They are called generally Seceders, and are divided into Burghers, Anti-Burghers, Original Burghers, and Original Seceders. There are also the body of dissenters called the Relief Church, who separated from the establishment in 1758. The only considerable body of Scottish dissenters of older standing, with the exception of the Episcopalians, are the Cameronians, or Reformed Presbyterian Synod, who are the representatives of the Covenanters of the seventeenth century. Mr. Macculloch calculates the whole number of dissenters in Scotland (exclusive of about 140,000 Roman Catholics) at about 360,000 or 380,000 persons. In Ireland, exclusive of the Roman Catholics, who alone outnumber the adherents of the established church in the proportion of 7½ to one, the principal dissenters are the Presbyterians, who are mostly confined to the province of Ulster. The Irish Presbyterians amount to between 600,000 and 700,000, and are more than twenty times as numerous

as all the other bodies of dissenters in that country taken together. (*Report of Commissioners of Religious Instruction in Ireland*, 1835.) [DODDRIDGE.]

DISSEPIMENTS, the partitions in the inside of a fruit which are formed by the union of the sides of its constituent carpels. Dissepiments are therefore necessarily alternate with the stigma. When partitions which do not bear this relation to the stigma occur in the inside of a fruit they are called phragmata or spurious dissepiments, as in the cathartocarpus fistula where they are horizontal, and in verbena where they are vertical.

DISSONANCE, in music, a term synonymous with discord. [DISCORD.]

DISTANCE. The only remark which we need make upon this common word is that it is very frequently applied to *angular distance*, meaning the angle of separation which the directions of two bodies include. Thus the spectator's eye being at O, the angle AOB is the angular distance (frequently simply called the distance) of the two points A and B. In the apparent sphere of the heavens, distance always means angular distance. The term *apparent distance* is frequently applied in the same case.

DISTEMPER, an inferior kind of colouring used for both internal and external walls, but principally for the former, instead of oil colour, being a cheap substitute.

It is composed of whitening mixed with size of a coarse quality, in the proportions of twelve pounds of whitening to one of size. The size is boiled and reduced to a proper working consistency by the addition of water, after which the colour is added to form the necessary tint. Coarser colours are used for distemper than are employed in oil painting and colouring. Scene painting is executed in distemper, and paper stainers employ distemper colour in printing and staining papers for walls. The colours used in these cases are however of a better quality, and the size employed is made from the hide of the buffalo, or parchment cuttings. The proportions of size and whitening in paper staining depend on the strength of the size. In five quarts of distemper, if the size is strong, one-fourth part will be sufficient; if weak, about one-half. In mixing the size and whitening much depends on the judgment of the workman. The distemper is used in a chilled state. Five quarts will stain about eighty-four yards of paper.

DISTHENE, a variety of KYANITE.

DI STICHOUS, a term in botany, signifies arranged in two rows, as the grains in an ear of barley, and the florets in a spikelet of quaking-grass.

DISTILLATION is a chemical process for applying a regulated heat to fluid substances in covered vessels of a peculiar form called *ALEMBICS*, in order to separate their more volatile constituents in vapour; and for condensing them immediately by cold into the liquid state, in a distinct vessel, styled a *refrigerator*.

The Arabians seem to have practised, in the remotest ages, the art of extracting the aromatic essences of plants and their flowers, in the form of distilled waters, to supply the luxuries of oriental baths. They are also supposed to have been the first to extract from wine a colourless intoxicating liquor by distillation. The term alcohol, now applied to such distilled spirit, and which is supposed to be Arabic*, appears at first sight to favour that idea, but as it was antiently employed to designate merely the extremity, tenuity, or impalpable state of pulverulent substances, it affords no just ground for the above conclusion. From certain passages in Pliny and Galen there can be no doubt that the Greeks and Romans were well acquainted with the distillation of aromatic waters. Indeed Nicander, a Greek poet and physician who lived 140 years before the Christian era, employs the terms ἀμβίξ *ambix* and distillation in describing the preparation of rose-water. From *ambix*, which signifies a pot, the Arabic name *alambic* or *alembic* is derived. The words *pot* and *poteen* are used in the same way by the modern Irish to designate a still and its spirituous product. It is obvious that distillation must have been a familiar process to the countrymen of Avicenna, since, in his treatise of catarrh, he compares the human body to an alembic; he regards the belly as the cucurbit or body, and the head as its capital, through which the humours distil, passing off by the nostrils as its beak.

Arnoldus de Villa Nova, a chemical physician of the thir-

* The true etymology of alcohol is uncertain. The Arabic word kohl, with the article al prefixed, signifies 'antimony reduced to a fine powder, and used as a collyrium for the eyes.'

teenth century, is the first author who speaks explicitly of an intoxicating spirit obtained by the distillation of wine, and he describes it as a recent discovery. He considers it to be the universal *panacea* so long sought after in vain. His disciple Raymond Lully, of Majorca, declares this admirable essence of wine to be an emanation of the Divinity, an element newly revealed to man, but hid from antiquity because the human race were then too young to need this beverage, destined to revivify the energies of modern decrepitude. He further imagined that the discovery of this *aqua vite*, as it was called, indicated the approaching consummation of all things—the end of the world. However much he erred as to the value of this remarkable essence, he truly foresaw its vast influence upon the condition of man, since to both civilized and uncivilized nations it has realized infinitely greater evils than were threatened in the fabled box of Pandora.

In his 'Chemical Theatre,' written towards the conclusion of the thirteenth century, Raymond Lully describes the distillation of ardent spirits thus:—

'Limpid and well-flavoured red or white wine,' says he, 'is to be digested during 20 days in a close vessel by the heat of fermenting horse-dung, and to be then distilled in a sand bath with a very gentle fire. The true water of life will come over in precious drops, which, being rectified by three or four successive distillations, will afford the wonderful *quintessence* of wine.'

'To prove its purity,' adds he, 'if a rag be dipped in it, and kindled, it will not become moist, but consume away.'

All the older writers imagined that *aqua vite* imbibed from the fire its inflammable, heating, and exhilarating qualities; so in order to increase these qualities to the utmost, they prescribed tedious and repeated warm digestions of the wine before it was put into the alembic, and an exceedingly slow distillation that each drop might come over instinct with fire.

In the present article we shall consider distillation solely in reference to the production of alcohol. The process, when applied to distilled waters, ethers, and oils, belongs to pharmacy, chemistry, perfumery, &c.

The subject naturally divides itself into two branches: 1, the formation of the alcohol; 2, its elimination from the ingredients with which it is mixed.

The only substances employed in this country in the manufacture of ardent spirits upon the great scale are different kinds of corn, such as barley, rye, wheat, oats, buckwheat, and maize. Peas and beans also have been occasionally used in small quantity. The principles in these grains from which the spirits are indirectly produced are starch and a little sweet mucilage, which, by a peculiar process called *mashing*, are converted into a species of sugar. It is the sugar so formed which is the immediate generator of alcohol, by the process of fermentation. Hermsstädt estimated that two pounds of starch properly treated would yield one quart of whiskey, of specific gravity 0.9427. The following kinds of corn afford of spirits of the said strength the quantities annexed to them in the scale:

| | |
|---------------------|-----------------------------|
| 100 pounds of wheat | 40 to 45 pounds of whiskey. |
| " rye | 36 to 42 " |
| " barley | 40 " |
| " oats | 36 " |
| " buckwheat | 40 " |
| " maize | 40 " |

We may therefore conclude, says Hermsstädt, that 100 pounds of corn will yield, upon an average, 40 pounds of spirits of the above-specific gravity. We shall presently see that 100 pounds or two bushels of corn produce much more alcohol in the British distilleries.

In mashing one or more kinds of corn, a greater or smaller proportion of malt is always mixed with the raw grain, and sometimes malt alone is used, as in the production of malt whiskey.

The process of malting is that incipient growth called germination, in which, by the disengagement of a portion of the carbon of the starch, in the form of carbonic acid, the ultimate vegetable elements become combined in such a proportion as to constitute a species of sugar. Malting is the most effectual method of converting starch into sugar. But it is known from the researches of Saussure, that if starch in solution be digested for some time at summer temperatures with gluten, it will undergo a remarkable change, nearly one-half being converted into a species of

sugar, and one-fifth into gum. A similar change is more rapidly effected upon starch by boiling its pasty solution with one-hundredth part of its weight of sulphuric acid. The recent discovery of diastase by Persoz and Payen has enabled us to effect this curious conversion with much greater certainty, and to a greater extent than was possible by the gluten or the acid. If 8 or 10 parts of ground malt be mixed with 100 parts by weight of starch previously diffused through 400 parts of water, at 140° Fahr., and if this mixture be kept at a temperature of from 158° to 166° for three or four hours, the nearly insipid pasty liquor will become a limpid syrup, which may be evaporated by a gentle heat into an uncrystallizable sugar, capable of being used as a substitute for ordinary sugar, not only in the vinous fermentation, but in many operations of the confectioner. The same change which takes place upon pure starch in the above experiment is effected in the process of mashing as carried on in breweries and distilleries. A larger or smaller proportion of the *fecula* of the corn is thereby converted into sugar, and thus brought into a state fit for producing alcohol by fermentation.

The manufacture of whiskey or ardent spirits consists of three distinct operations: first, mashing; second, fermentation; third, distillation.

1. *Mashing*.—Either malt alone, or malt mixed with other grains, and coarsely ground, is put into the mash-tun, along with a proper proportion of hot water, and the mixture is subjected to agitation by a mechanical revolving apparatus, exactly similar to that employed in the breweries for the manufacture of beer. When malt alone is used, the water first run into the mash-tun among the meal has usually a temperature of 160° or 165° Fahrenheit, but when a considerable proportion of raw grain is mixed with the malt, the water is let on at a lower temperature, as from 145° to 155°, for fear of making such a pasty magma as would not allow the infusion or worts to drain readily off.

The following are the quantities of malt and raw grain mixed which have been found to afford a good product of whiskey in a well-conducted Scotch distillery:—

| | |
|---|------------|
| 252 bushels of malt, at 40 pounds per bushel. | |
| 948 do. barley, | 53½ do. do |
| 150 do. oats, | 47½ do. do |
| 150 do. rye, | 53½ do. do |

1500

From each bushel of the above mixed meal 2½ gallons of proof whiskey (specific gravity 0.921) may be obtained, or 18½ gallons per quarter. A few distillers are skilful enough to extract 20 gallons from a quarter of that mixture. Ten imperial gallons may be considered a fair proportion of water to be introduced into the mash-tun for every bushel of meal at the first infusion. After two or three hours' agitation, the whole is left to repose for an hour and a half, and then the worts are drawn off to about one-third the volume of water employed, the rest being entangled in a pasty state among the farina. About two-thirds of the first quantity of water is now let into the tun, but at a temperature somewhat higher, and the mashing motion is renewed for nearly half an hour. A second period of infusion or repose ensues, after which these second worts are drawn off. Both infusions must be cooled as quickly as possible down to the temperature of 80° or 70° Fahr., otherwise they are apt to run into the acetous fermentation by the rapid absorption of atmospheric oxygen. This refrigeration is usually effected by exposing the wort for some time in large shallow cisterns, called coolers, placed near the top of the building, where it may be freely exposed to the aerial currents. But it is sometimes cooled by being passed through serpentine tubes surrounded with cold water, or by the agency of ventilators blowing over its surface in extensive cisterns only three or four inches deep.

After the second wort is drawn off, a third quantity of water, fully as great as the first, but nearly boiling hot, is run into the mash-tun, and well incorporated with the magma by agitation; after repose, this third wort is also drawn off, cooled, and either directly mixed with the preceding worts, or after it has been concentrated by boiling down; in most cases however it is reserved, and used instead of water for the first infusion of a fresh quantity of meal.

As a revenue of five and a half millions sterling is derived from the whiskey distilleries, their operations are sub-

ected to a very strict code of regulations, which are administered and enforced by the excise. One of these prescribes the range of specific gravity at which the worts may be lawfully let down into the fermenting tun. The distiller must give notice to the excise officer in attendance, before commencing a *round*, whether he intends to distil from malt alone, or from a mixture of it with raw grain, and of the density he intends his worts to be when introduced into the fermenting backs. He may change this notice at the end of a month or six weeks, when, upon another notice of six days, he may change his specific gravities. In England the law restricts the distiller to the densities between 1.050 and 1.090; in Scotland, between 1.030 and 1.075, which, for brevity's sake, are called 50, 90, 30, and 75, omitting the 1.000 common to them all. At these densities the quantities of solid saccharum contained in one barrel of 36 imperial gallons, are 47.25 lbs., 85 lbs., 28 lbs., and 70.3 lbs. respectively.

The mashing and fermentation are jointly called *brewing*, and the period in which they are carried on is by law kept quite distinct from the *distilling* period, the one occupying usually one week, and the other another in rotation. About 150 gallons of wort or wash are obtained from each quarter of corn employed.

The first of the above worts will have generally the density of 1.078 when the grain is good and the mashing is well managed, and the second a density of 1.054, so that the mixture will have a specific gravity somewhat above 1.060, and will contain about 60 pounds of extract per barrel. Now, by the excise rules, 100 gallons of such wort ought to yield one gallon of proof spirit for every five degrees of attenuation which its specific gravity undergoes in the fermenting tun, so that if it falls from 1.060 to 1.000, 12 gallons of proof spirit are supposed to be generated, and must be accounted for by the distiller. If he understand his business well, he will be able to produce from 5 to 10 per cent. more than the law requires. Mr. Smith, in his examination before the Molasses Committee of the House of Commons in 1831, states that in one year, reckoning by computation from the above data, he showed produce for 60,000 or 70,000 gallons more than the presumed quantity, and paid duty accordingly; and that in 1830 he was charged for 80,000 gallons of spirits actually produced beyond the presumptive charge, according to the attenuated gravity of the worts.

In consequence of an alteration in the excise laws about twelve years ago, the distillers were allowed to ferment worts of less density than they previously could, and have been able to effect a more productive fermentation. They have been also enabled thereby to reduce the proportion of malt in the mixed meal. Formerly they were accustomed to use three parts of malt to four parts of barley, or two to three, but they soon diminished the malt to one-fifth, and latterly to one-eighth, or one-tenth, of the whole grain. One principal use of malt, besides its furnishing the saccharine ferment called diastase, is to keep the mash magna porous, and facilitate the drainage of the worts.

The cost at which whiskey may be made in England is thus stated by Mr. Smith:—When barley is 38s. per quarter, he reckons that one gallon of proof spirits costs 2s. for corn or meal, 1s. 2d. for the charge of manufacturing, 2d. as the duty on malt employed, and 7s. 6d. as the duty on spirit, amounting altogether to 10s. 10d. If we consider that from 18 to 20 gallons of proof spirits may be made from eight bushels or one quarter of mixed grain, we must think this statement of Mr. Smith's somewhat overcharged. Indeed good proof spirits may be bought from some distillers at a considerably less price, which proves either that they can manufacture the article more economically, or that they make a profit at the expense of the revenue.

II. Fermentation.

This is undoubtedly the most intricate, as it is the most important process in distillation, but unfortunately one hitherto studied with too little regard to scientific precision by the distiller. Experiments have proved that the quantity of saccharine matter converted into alcohol is dependent upon the proportion of ferment or yeast introduced into the worts; if too little be used a portion of the sugar will remain undecomposed, and if too much, the spirits will contract a disagreeable taste. In general, the worts are let down at the specific gravity of 1.050 or 1.060, and at a temperature varying from 60° to 70° Fahr., and for every 100 gallons one gallon of good porter yeast is immediately poured in and thoroughly incorporated by agitation with a

stirrer. When by the attenuation the density is diminished to 1.035 one half gallon more is added, and another half gallon at the density of 1.025, after which the worts usually receive no further addition of yeast. The temperature of the fermenting mass rises soon after the introduction of the yeast 8 or 10 degrees, and sometimes more; so that it reaches in some cases the 85th or 90th degree of Fahrenheit's scale. From the appearance of the froth or scum the experienced distiller can form a tolerably correct judgment as to the progress and quality of the fermentation. The greatest elevation usually takes place within thirty-six hours after the commencement of the process. The object of the manufacturer of spirits is to push the attenuation as far as possible, which so far differs from that of the beer-brewer, who wishes always to preserve a portion of the saccharine matter undecomposed to give flavour and body to his beverage. The first appearance of fermentation shows itself by a ring of froth round the edge of the vat usually within an hour after the addition of the yeast; and in the course of five hours the extrication of carbonic acid from the particles throughout the whole body of the liquor causes frothy bubbles to cover its entire surface. The temperature meanwhile rises from 10 to 15 degrees according to circumstances. The greater the mass of liquid, the lower the temperature at which it was let down into the tun, and the colder the surrounding atmosphere, the more slowly will the phenomena of fermentation be developed under a like proportion of yeast and density of the worts. In general large vats afford a better result than small ones, on account of the equality of the process. It is reckoned good work when the specific gravity comes down to 1.000, or that of water; and superior work when it falls 4 or 5 below it, or to 0.995.

After thirty-six hours upon the moderate scale the yeasty froth begins to subside, and when the attenuation gets more advanced, the greater part of it falls to the bottom on account of its density relatively to the subjacent fluid. In from forty-eight to sixty hours the liquor begins to grow clear, and becomes comparatively tranquil. It has been deemed advantageous towards the perfection of the fermentation to rouse up the wash occasionally with a proper stirrer, and in some cases to increase its temperature a few degrees by the transmission of steam through a serpentine pipe coiled round the sides of the vat. Some have imagined that a considerable portion of spirit is carried off by the great volume of carbonic acid evolved, and have proposed to save it by covering the vats air tight, and conducting the gas through a pipe in the lids into a vessel containing water. The economy of this apparatus is not worth the expense and trouble which it occasions. The distillers content themselves with enclosing their vats after the first violence of the action under tolerably tight covers.

Mr. Octavius Smith, the eminent distiller of Thames Bank, states in his examination before the Molasses Committee, that the acetous fermentation is always proceeding simultaneously with the vinous fermentation; for judging by the usual tests there is always a slight degree of acidity in fermenting wash; that vinegar is in fact forming along with alcohol, or that while the attenuation is increasing, acetic acid is being formed. This important fact, which agrees with our own experience, serves to show how very fallacious a test the attenuation or diminution of density is of the amount of alcohol generated and existing in a fermented wash. The acetic acid along with the undecomposed mucilaginous starch may, in fact, so far counteract the attenuating effect of the spirits as to produce a specific gravity which shall indicate 10 or 15 per cent. less spirit than is actually present in the wash. Hence the excise officers should be instructed to use test-stills in order to verify upon a small aliquot part the real quantity of distillable alcohol contained in each back of wash. After due agitation of the wash three samples should be taken by the dipping cylinder, or sinking-jar, one from the bottom, one from the middle, and one from the top; which being mixed and distilled would denote exactly the whole quantity of spirit that could possibly be extracted.

This test-still was clearly described and forcibly pressed upon the attention of the exchequer by Dr. Ure in his several examinations before the said Molasses Committee. The distillers in general, as might have been expected, scouted the idea of the possibility of ascertaining the quantity of spirits in a large back, from the distillation of a quart or a gallon of the wash; but Mr. Steel showed that by the distillation of 1000 grains in a glass retort

(about one-tenth of a pint), he had obtained a produce of spirit corresponding very nearly with the result of the distillation of ten gallons of the same wash in a proper still. And Mr. O. Smith, when closely questioned, admitted that means might be devised to enable an excise officer to perform the above analytical distillation with as great precision as the scientific man who had contrived the apparatus for him. The preventive check, or attenuation, as it is called, which the excise apply to the fermented wash, is good for very little against a fraudulent distiller, because he can so easily introduce immediately before the visit of the officer, towards the end of the fermentation, such a quantity of salt as will so alter the density as completely to disguise and conceal seven or eight per cent. of the spirit, without in the least injuring its quality in the act of distillation. In fact, Mr. O. Smith acknowledges to its full extent the futility, or rather nullity, of that check, for he says, 'I conceive that any check which does not approximate any nearer to the fact than that just alluded to (the attenuated gravity), is almost useless, inasmuch as a distiller willing to evade the duty, could do so, as the difference between the charge of the saccharometer and the actual spirit produced, allows ample room for the most exorbitant smuggler.*' Mr. William Baker, surveying-general examiner of excise, describes a mode of smuggling the spirits which would enable the distiller to make the quantity run off coincide with the quantity shown by the above fraudulent density. 'There was a pipe fastened before it came to the end of the worm, and it was carried through the wall into another part of the building.†' Any person may perceive how easy it is, with the actual distillatory apparatus, to lead a small branch tube from any point of the worm through the side or bottom of the worm-tub into a concealed subterranean receiver.

It is curious to contrast the actual insecurity of the revenue from the distillation of whiskey with the multiplicity of precautions taken to prevent frauds; self-interest on the one hand being so much stronger and sharper than duty on the other. 'Examinations with us are constantly making; for example, we are surveyed this morning at six o'clock, the officers take their accounts and gauges, make calculations, and do a great deal of work, occupying several hours: at ten o'clock they again survey, going over the whole ground, where they continue a considerable time, frequently until the succeeding officer comes on duty: at evening too another survey takes place, similar to the former, but not by the same people; then at evening, six, the survey is repeated: at evening, ten, there comes another survey, by an officer who had not been engaged in any of the previous surveys of that day. He is not relieved until morning, six, of the day following; in addition to which, we are subject to frequent and uncertain visits of the surveyor and general surveyor: we are never out of their hands.‡'

It is computed that every 5 degrees of attenuation, as it is called, that is, every diminution of the number 5 upon the specific gravity in the third place of decimals, ought to produce 1 per cent. of proof spirit, or 1 gallon out of 100, as formerly stated; so that if the wort be set at 1.055, and come down to 1.000, 11 gallons of proof spirits are chargeable upon each 100 of such wash. In the fermentation of sugar worts, 1 gallon of proof spirits was calculated for every four similar degrees of attenuation. But distillation from sugar or molasses-wash is now illegal. With corn-wash, there is never more than four-fifths of the saccharine matter decomposed into alcohol and carbonic acid, in the best-managed fermentation, and frequently indeed much less. In fact, each pound of real sugar may be resolved by a successful process into half a pound of alcohol, or into about one pound of proof spirit, and hence as a solution of sugar at the density of 1.060, contains 15 per cent. by weight, or 16 per cent. by measure, which is nearly 1.7 pounds per gallon, it should yield nearly 170 pounds from 100 gallons, or 180 pound measures equal to 18 gallons of proof spirit; whereas 100 gallons of corn-wash, fermented at the above density, are computed by the excise law to yield only 12 gallons, and seldom produce more than 13 and a small fraction. There is thus therefore a wide difference between the produce of spirit from real saccharine matter as fermented by the man of science, and the produce obtained by our best malt and

grain distillers. The main defect lies undoubtedly in the very imperfect saccharification of the fecula of the corn in the mashing process, which, in our opinion, would require to be entirely remodelled, and conducted upon sounder and more scientific principles.

In the huge fermenting vats used by the corn distillers of this country, the fermentation goes on far more slowly than when conducted upon the moderate scale referred to in the account of this process given above. About 1 gallon of yeast is added at first for every 100 gallons of wort, and a half gallon additional upon each of the succeeding four days, making in the whole 3 per cent.; when less can be made to suffice, the spirits will be better flavoured. The fermentation goes on during from six to twelve days, according to the modifying influence of the circumstances above enumerated. After the fifth or sixth day, the tuns are covered in, so as to obstruct, in a certain degree, the discharge of the carbonic acid, as it is supposed that this gas in excess favours fermentation. The temperature is usually greatest on the fourth or fifth day, when it sometimes rises to 85° Fahr., from the starting pitch of 60° or 56°. Whenever the attenuation has reached the lowest point by the hydrometer, the wash ought to be distilled, since immediately afterwards the alcohol begins to be converted into acetic acid. This acidification may be partially repressed by the exclusion of atmospheric oxygen.

III. Distillation.

There is no chemical apparatus which has undergone so many metamorphoses as the still and condenser. In its simplest form it has been already represented and described. [ALEMBIC.] It may be considered to have reached its highest point of perfection, as to power and rapidity of work, in Scotland, when the distillers paid a stipulated sum per annum to the revenue for the privilege of a still of a certain size, and when therefore they derived a profit proportionable to the quantity of spirits they could run off in a given time. In the year 1799, from a report presented to the House of Commons, it appears that the Scotch distillers at that time were able to work off 80 gallons of wash in eight minutes, and the duty was levied accordingly; but very soon afterwards they contrived means of doing the same thing in about three minutes. The stills made for such rapid operation were shallow, and exposed a great surface to the fire. One of them is figured and described in Ure's 'Dictionary of Chemistry.' Since the year 1815, the whiskey duties have been levied on the quantity distilled, independent of the capacity of the still. This change has introduced a modification in the distilling apparatus, with the view of combining purity of product with economy of time. The body of the still is still comparatively flat, so as to expose a large surface to the fire; but the tapering upper part, corresponding to the capital of an alembic, is made very long, rising sometimes 15 or 20 feet before it terminates in the worm pipe or refrigeratory for condensation.

Great distilleries are usually mounted with two stills, a larger and a smaller. The former is the *wash* still, and serves to distil from the fermented worts a weak crude spirit called *low wines*; the latter is the low-wine still, and rectifies by a second process the product of the first distillation. In these successive distillations a quantity of fetid oil, derived from the corn, comes over along with the first and last portions received, and constitutes by its combination what is styled the strong and weak *faints* in the language of the distilleries. These milky faints are carefully separated from the limpid spirit by turning them as they begin to flow from the worm-end into distinct channels, which lead to separate receivers.

From these receivers the various qualities of spirit, low wines, and faints, are, for the purpose of redistillation, pumped up into charging backs, from which they are run in gauged quantities into the low-wine and spirit stills. The pumps afford many facilities to the fraudulent distiller for abstracting spirits without the cognizance of the excise, and thus injuring at once the fair dealer and the revenue. It would be easy to arrange a distillery so that pumps would be quite superseded, with their numerous joints and screws, and to conduct the spirituous liquids from the appropriate receivers to the chargers and stills, on successive levels, through a series of pipes, without external orifice.

One of the greatest improvements in modern distillation is the accomplishment of this essential analysis of the impure spirit at one operation. Chemistry had been long

* Report on the use of Molasses, &c., 1831, p. 185, Q. 2720.

† Ibid., p. 179, Q. 2612.

‡ Thomas Smith, Esq., of Whitechapel-road, distiller, in *Molasses Commodities Report*, p. 148, Q. 3190.

familiar with the pneumatic apparatus of Woulfe, without thinking of its adaptation to distillery apparatus, when Edouard Adam, an illiterate operative, after attending by accident a chemical lecture at Montpellier, where he saw that apparatus, immediately employed it for obtaining fine brandy, of any desired strength, 'at one and the same heat.' He obtained a patent for this invention in July, 1801, and soon afterwards was enabled by his success to set up in that city a magnificent distillery, which attracted the admiration of all the practical chemists of the day. In November, 1805, he obtained a certificate of improvements whereby he could extract from wine, at one process, the whole of its alcohol. Adam was so overjoyed after making his first experiments, that, like another Archimedes, he ran about the streets telling every body of the surprising results of his new invention. About the same time, Solimani, professor of chemistry at Montpellier, and Isaac Berard, distiller in the department of Gard, having contrived two distinct systems of apparatus, each most ingenious, and obtaining results little inferior to those of Adam, became in consequence formidable rivals of his fame and fortune.

Into the description of these stills, of those of Derosne, Baglioni, &c., on the continent, or of their many modifications in this country, the limits of this article do not allow us to enter. In the treatises of Lenormand and Dubrunfaut, the construction of stills is described with a minuteness of detail sufficient to satisfy the most curious inquirers. We shall content ourselves with investigating the scientific principles of a perfect spirit still, and with a delineation of its outlines.

The boiling point of alcohol varies with its strength, in conformity with the numbers in the following table.

| Specific Gravity. | Boiling point by Fahrenheit's Scale. | Specific Gravity. | Boiling point by Fahrenheit's Scale. |
|-------------------|--------------------------------------|-------------------|--------------------------------------|
| 0.7939 | 168.5° | 0.8575 | 181.0 |
| 0.8034 | 168.0 | 0.8631 | 183.0 |
| 0.8118 | 168.5 | 0.8765 | 187.0 |
| 0.8194 | 169.0 | 0.8892 | 190.0 |
| 0.8265 | 172.5 | 0.9013 | 194.0 |
| 0.8332 | 173.5 | 0.9126 | 197.0 |
| 0.8397 | 175.0 | 0.9234 | 199.0 |
| 0.8458 | 177.0 | 0.9335 | 201.0 |
| 0.8518 | 179.0 | | |

Hence the lower the temperature of the spirituous vapour which enters into the refrigerator, the stronger and finer will the condensed spirit be, because the noxious oils are less volatile than alcohol, and come over chiefly with the aqueous vapour. A perfect still should therefore consist of three parts: first, the cucurbit or boiler; second, the

rectifier for intercepting the greater part of the watery particles, and the whole of the corn oil; and third, the refrigerator. Such a construction is represented in *fig. 1, 2, and 3*, in which the resources of the most refined French stills are combined with a simplicity and solidity of construction suited to the grain distilleries of the United Kingdom. Three principal objects are obtained by this arrangement—first, the extraction from fermented wort or wine, at one operation, of a spirit of any desired cleanness and strength; second, a great economy of time, labour, and fuel; third, freedom from all danger of blowing up or boiling over by mismanaged firing. When a mixture of the alcohol, water, and essential oil, in the state of vapour, is passed upwards through a series of winding passages, maintained at a regulated degree of heat, from 170° to 180°, the alcohol alone, in notable proportion, retains the elastic form, and proceeds onward into the refrigeratory tube, in which these passages terminate, while the water and the oil are in a great measure condensed and retained in these passages, so as to drop back into the body of the still, and be discharged with the effete residuum.

The system of channels shown in *fig. 2* is so contrived as to bring the compound vapours which rise from the alembic *A* into intimate and extensive contact with metallic surfaces, immersed in a water-bath, and maintained at any desired temperature by a self-regulating thermostat or heat-governor. The neck of the alembic tapers upwards as shown at *B, fig. 1*; and at *C, fig. 2*, it enters the bottom or ingress vestibule of the rectifier *CF*. *F* is its top or egress vestibule, which communicates with the under one by parallel cases, or rectangular channels *D, D, D*, whose width is small compared with their length and height. These cases are open at top and bottom, where they are soldered or riveted into a general frame within the cavity, inclosed by the two covers *F, C*, which are secured round their edges *E, E, E*, with bolts and packing. Each case is occupied with a numerous series of shelves or trays, placed at small distances over each other, in a horizontal or slightly inclined position, of which a side view is given in *fig. 3*, and cross sections at *D, D, D, fig. 2*. Each shelf is turned up a little at the two edges and the one end, but sloped down at the other end, so that the liquor admitted at the top may be made to flow backwards and forwards in its descent through the system of shelves, as indicated by the spouts in *fig. 3*. The shelves of each case are framed together by two or more vertical metallic rods, which pass down through them, and are fixed to each shelf. On removing the cover, the sets of shelves may be readily lifted out of the cases to be cleaned; and are hence called *moveable*.

The intervals *I, I, I, fig. 2*, between the two cases, are left free for the circulation of the water contained in the bath-vessel *G, G*; these intervals being considerably narrower than the cases. *Fig. 4* represents in plan

ne surface of the rectifying cistern, shown by two different sections in *figs.* 2 and 3. H, K, *figs.* 2 and 4, is the thermostat or heat-governor, shaped somewhat like a pair of tongs. Each leg is a compound bar, consisting of a flat bar or ruler of steel, and one of zinc alloy, riveted facewise together, having their edges up and down. The links at K are joined to the free ends of these compound bars, which receding by increase of temperature, and approaching by its decrease, act through a lever upon the stop-cock L, fixed to the pipe of a cold water reservoir, and are so adjusted by a screw-nut, that whenever the water in the bath-vessel G, G rises above the desired temperature, cold water will be admitted through the stop-cock L and pipe N into the bottom of the cistern, and will displace the over-heated water by the overflow pipe M. Thus a perfect equilibrium of caloric may be maintained, and alcoholic vapour of correspondent uniformity be transmitted to the refrigeratory.

Fig. 5 is the refrigeratory, consisting of a double tube, placed in a zigzag direction, but in one plane, and supported by the two upright beams. The alcoholic vapour enters at the orifice K, and descends along the inner tube marked by dotted lines till it becomes condensed by the counter-current of water continually ascending in the annular space between that block-tin or copper tube, and the outer cast-iron pipe F. The water of condensation enters into that annular space at the point G, being supplied by the pipe D, and the nose of the stop-cock L. The funnel into which the cold water is poured must be somewhat higher than the point K, from which that water is discharged, after having been heated to the same temperature as that of the alcoholic vapour last exposed to its influence.

When water has its particles kept by any means at rest, it becomes a very bad conductor of caloric; it acquires its maximum, conducting or cooling power, only when its particles are set in rapid and continuous motion. The present construction of worm is calculated to effect the most complete refrigeration of the vapours with the smallest expenditure of cold water, and to turn out the spirit at B in the coolest state. It has, moreover, two subsidiary recommendations, one to the distiller, and another to the revenue. Its interior may be most easily cleaned by unscrewing the bolts of the joints C C, and running sponge-rammers through the several straight pipes of which the series consists; no offset or branch pipe can be taken from it secretly, as is often practised upon the worms immersed in worm-tubs for fraudulent purposes. The number of turns in this serpentine may be increased at the pleasure of the distiller; a few only being represented in the figure for the sake of illustration. If a small portion of the overflow hot water be made to trickle down and moisten the outside surfaces of the two or three upper lengths of the serpentine, it will by evaporation produce a considerable degree of coolness, and thereby save cold water.

The preceding still apparatus is worked as follows: into the alembic put as much fermented liquor as will protect its bottom from being injured by the fire, when it is not plunged in a bath of muriate of lime, but exposed directly to the fuel. As soon as the ebullition in the alembic has raised the temperature of the water-bath G G to the desired rectifying pitch, whether 170° or 180°, the thermostat instrument is to be adjusted by its screw-nut, and then the communication with the charging back or cistern is to be opened by moving the index of the stop-cock O over a proper portion of its quadrantal arch. The wash will now descend in a regulated stream through the pipe O F, thence spread into the horizontal tube P P, and issue from the orifices of distribution into the respective flat trays or spouts. The manner of its progress is shown for one set of trays in *fig. 3*. The direction of the stream in each shelf is evidently the reverse of that in the shelf above and below it; the turned-up end of one shelf corresponding with the discharge slope of its neighbour.

By diffusing the cool wash or wine in a thin film over such an ample range of surfaces, the constant tendency of the bath to exceed the proper limit of temperature is counteracted to the utmost without waste of time or fuel; for the wash itself *in transitu* becomes boiling hot, and experiences a powerful steam distillation. Thus also a very moderate influx of water through the thermostat stop-cock suffices to temper the bath; such an extensive vaporization of the wash producing a far more refrigerant influence than its simple heating to the boiling point. It

deserves peculiar remark, that the greatest distillation with the least fuel is here effected without any pressure in the alembic; for the passages are all pervious to the vapour, whereas, in almost every wash-still heretofore contrived for similar purposes, the spirituous vapours must force their way through successive layers of liquid, the total pressure from which causes undue elevation of temperature, obstruction to the process, and forcing of the junctures. Whatever supplementary refrigeration of the vapours in their passage through the bath may be deemed proper will be administered by the heat-governor.

The bath regulated by the thermostat may however be used for obtaining fine spirits at one operation, without transmitting the wash or low wines down through its interior passages; in which case it becomes a simple rectifier. The empyreumatic taint which spirits are apt to contract from the action of the naked fire on the vegetable gluten in contact with the bottom of the still, is somewhat counteracted by the rotation of chains in the large wash-stills; but it may be entirely prevented by placing the still in a bath of strong solution of muriate of lime R R, *fig. 1*, regulated by a thermometer or, still better, a thermostat. Thus a safe and effectual temperature of from 270° to 390° Fahr. may readily be obtained. For further details, see the specification of Dr. Ure's patent still.

The quantity of proof spirit which paid duty in 1836 was twenty-seven millions of gallons, thirteen millions of which were made in Great Britain, and fourteen millions in Ireland. Of the latter, a considerable quantity was imported into this island. The manufacture of whiskey does not seem to have been diminished in this country as it has been in the United States by the influence of the temperance societies.

| | |
|------------|-------------------------------------|
| In 1832 .. | 20,778,521 gallons paid excise duty |
| 1834 .. | 23,397,806 " |
| 1836 .. | 27,137,000 " |

showing an increase which is far out of proportion with that of the population. We may add to the last quantity three millions of gallons on the score of smuggling, in licensed and illicit distilleries; making thirty millions to be the real amount of whiskey consumed by our population of twenty-four millions. [BRANDY, GIN, RUM, THERMOSTAT, WHISKEY.]

DISTORTION. Deformity of the person may be advantageously classed for the purpose of discussion under two principal heads: *malformation* and *distortion*. The former is, for the most part, congenital, and is usually characterized by the deficiency or redundancy of parts, or by imperfections and irregularities of structure. The latter, arising generally after birth, comprises all permanent deviations from the natural shape or position which are effected by the influence of external or internal force in parts originally soft and flexible, or such as have acquired unnatural pliancy by accident or disease.

It is to the latter class of deformities only that our attention is for the present directed. But even thus limited, the subject is so extensive that we must once for all refer the reader for more precise information on several of its most interesting subdivisions to other professional works.

I. Every part of the body capable of independent motion is furnished with two sets of muscles, acting in contrary directions, the purpose of which is obviously to bring the part back to its place after movement in either direction. In the position of equilibrium these muscles are not in a state of absolute relaxation even during sleep; on the contrary, they continue to act with considerable energy, each exactly counterbalancing the other. This is called their tone or tension, and it is calculated to give great steadiness to the part thus held at rest between opposite forces. But if one set of the muscles should be suddenly cut across, the tension of their antagonists still remaining in action, the consequence would be a movement in obedience to the latter till the contraction had reached its limit; and the part in question would permanently retain the position into which it had thus been moved. The same effect would result if the muscle, instead of being divided, were paralysed by the interruption of its nervous communication with the brain. Again, if the tone of one muscle were increased by spasm or otherwise, so as to give it a decided preponderance over its antagonist, the result would be similar. These considerations will sufficiently explain the nature of one large class of distortions, namely, those which result from affections of the *brain, muscles, and nerves*.

1. The simplest of these is the *drawn mouth*, or *hemiplegia*. It arises in this way: in consequence of an extravasation of blood or some other cause, the functions of one side of the brain are interrupted; the muscles of the cheek on the same side, deriving their nerves from that part of the brain, are paralyzed, and the retractors of the opposite angle of the mouth being no longer balanced by an equal force, draw it up towards their origin, and retain it in that position.

2. *Strabismus*, or squinting, is frequently produced in the same way by a partial paralysis of that muscle the office of which is to turn the globe of the eye in the opposite direction, or it may arise from undue contraction of the muscle on the same side.

3. It is remarkable that *hysteria* is sometimes accompanied by a distortion of the last-mentioned kind, produced by a spasmodic contraction of the flexor muscles of one of the joints, commonly the knee or hip. For months or years this painful condition may last without mitigation: yet it may vanish all at once under the influence of some powerful impression of the body or mind. The entire loss of the voice, which sometimes comes on suddenly in similar constitutions, and after long resisting every remedy, as suddenly departs, is probably an analogous affection of the muscles of the larynx.

4. *Wry-neck* is a distortion also due to irregular muscular action. It generally comes on gradually in infancy, and consists in a shortened and contracted state of the *sternomastoid* muscle, of that side to which the head is inclined and from which the face is turned. *Club-foot* is often nothing more than a similar contraction of the muscles of the calf, which draw up the heel and eventually disturb the integrity of the ankle joint. This complaint also comes on at an early age, and is sometimes congenital. By proper means they both admit of relief, and often of a cure.

The list of distortions depending on a morbid condition of the muscular or nervous functions might easily be extended.

II. But by far the most common and important class of these affections is that which originates in disease of the bones.

1. The firmness and rigidity of the bones depends upon the due proportion of the earthy matter, phosphate of lime, that enters into their composition. If the proportion of this ingredient be too great, as in old age, and in the disease called *fragilitas ossium*, they become brittle, and are broken by the slightest causes; if it be too small, they become unnaturally pliant, and are distorted by the pressure of the superincumbent weight, or the contraction of the muscles.

The latter condition is prevalent with other structural changes in the disorder called *rickets*. The medical name of this complaint is *rachitis* (from *ράχις*, the spine), and was given to it by Glisson, who first described it, partly because he conceived the vertebrae to be the bones most commonly implicated; but chiefly, it would appear, from the resemblance to the English name. His doctrine was erroneous; and the error perpetuated by the misnomer has led to serious mistakes in practice as well as theory. The spine is undoubtedly liable to partake with the rest of the skeleton in the morbid condition of rickets, but certainly not in a greater degree than the other bones.

This malady seldom appears within the ordinary period of lactation, or after puberty. It is ushered in and attended throughout by general febrile disturbance, and is closely connected with a peculiar morbid condition of the nutritive functions. The opinion that it is of scrofulous origin has lately been strongly controverted, and does not in reality appear to be well supported by facts. It is most common among the poor, and in closely-peopled districts, as all the diseases of children are; but it is by no means confined to either, or to children whose constitutions are apparently the most feeble in other respects. Indeed it is a frequent remark, that the most robust and powerful men exhibit tokens of having been rickety in their childhood. Among such indications are smallness of the pelvis, with inward or outward curvature and disproportionate shortness of the lower limbs. This sudden check to the development of the skeleton, constantly observed in rickety children, with the distortion arising from the unnatural softness of the bones, is the most usual cause of the short stature, as well as the proverbial ugliness, of dwarfs.

In extreme cases of this complaint the head is generally small and pointed: no longer supported by the yielding and shortened neck, it sinks down between the shoulders; the occiput is thrown back and almost touches the hump

formed by the incurvated spine behind the chest: the chin is thrust forward, giving an expression to the features very characteristic of the dwarf, and rests upon the breast bone, which is very prominent: on each side the ribs are flattened, and bulge in upon the lungs. The shoulders, losing the support of the wreathed and twisted clavicles, approach towards each other in front, drawing with them the scapulae, which stick out laterally, and add considerably to the deformity as seen from behind; the arms, though bent and in reality shortened, seem of disproportionate length; the lumbar spine is thrust inwards; the pelvis is small and flattened; the thighs are bowed forward; the knees, with their patellae at the side instead of in front of the joint, touch or overlap each other; while the feet are set wide apart, a sudden twist above the ankle still permitting the soles to be set to the ground. Such are some of the varied changes which exhibit a melancholy proof of the prevalence of the disease in every part of the bony frame, and almost defy description. Of course such extreme cases of rickety distortion are comparatively rare; yet almost daily instances are seen by those whose duty calls them into the unwholesome courts and alleys of the metropolis, and slighter examples of the affection are extremely common.

Recovery, even from considerable degrees of this affection, is more frequent and rapid than might be imagined; but the pelvis and lower limbs, which, as above mentioned, are the most commonly and extensively implicated, seldom completely regain their natural proportions. This fact, as it regards the female pelvis, is worthy of notice, being the cause of by far the most dangerous kind of difficult parturition. It is in extreme cases of this sort that the Cæsarean section has been practised.

Independently of rickety distortion, there are two other kinds of curvatures of the spinal column which demand a brief notice.

The first, which has frequently been mistaken for rachitis, is usually called *lateral curvature*, to distinguish it from the more serious kind of distortion next to be considered, which is called *angular curvature*.

2. Unlike rickets, which almost always commence in infancy or early childhood, lateral curvature of the spine seldom appears before the tenth year. The external deformity consists in the prominence of one hip (generally the right), and elevation of the corresponding shoulder, the blade of which sticks out in unsightly protuberance behind. The opposite hip and shoulder are respectively flattened and depressed; and the symmetry of the chest is destroyed, one side being larger than the other, and both twisted and misshapen. On examination the spine is found to have a double curvature sideways so as to resemble the letter S, but generally turned the other way, the concavity of the lower curve being on the right, and the upper on the left side. It arises from weakness in the spinal muscles and local elongations of the ligaments of the vertebrae, from the habit of resting the weight in sitting or standing more on one side than the other; and that side is usually the right. The position is more easy than the upright one, and when not corrected by fitting exercise and change in the nature of the employment, it becomes habitual, and the twist of the person permanent and increasing. The subjects of this kind of distortion are chiefly slender and delicate girls in the middle and upper classes, the poor being comparatively exempt. It comes on insidiously, the attention not being awakened by any particular derangement of the health beyond a certain degree of languor and susceptibility of fatigue, and perhaps a sluggish state of the digestion. The first symptom that betrays its presence is usually a tendency of the dress to slip off the left shoulder. It is much promoted by means often used to prevent it, such as confinement and restraint of the person and posture by stays, backboards, high-backed chairs, reclining on a board, and other contrivances to improve the figure, and restrain the development of the natural form; as well as by the sedentary habits and inappropriate exercises of the academy or school-room. Nature is not to be coerced with impunity by fantastic caprices and contrivances: a good figure as well as good health must be found, if anywhere, in the open air of the fields, in loose and easy clothing, and in unconstrained exercise of the limbs, such as children will always adopt, if left to choose for themselves, in ways much better suited to their age and strength than any that can be invented for them.

3. Angular curvature of the spine is a deformity very

different in its nature and appearance from the last described. It arises for the most part from ulceration of a scrofulous kind in the bodies of the vertebrae. The support in front being thus lost, the spine is sharply bent forwards so that one or more of the spinous processes project behind, indicating the position of the diseased vertebrae. This complaint is attended with incomplete paralysis of the lower extremities, and is not unfrequently fatal. In case of recovery the bodies of the contiguous vertebrae are approximated and consolidated with what remains of those which were diseased by the deposition of bony matter. It is in this species of spinal complaint only that rest and the recumbent posture are expedient. The observance of these essential precautions concurrently with other means frequently brings about a cure; the distortion however is permanent.

Diseases of a similar kind frequently occur in the bones and joints of other parts of the body; they require similar treatment, and are followed by analogous consolidations and distortions.

4. Rheumatism, and other disorders, and even common inflammations, occurring in a high degree within the joints or in their neighbourhood, occasionally produce like effects.

III. Distortions are sometimes occasioned by the contraction of other parts than those which are concerned in motion.

1. Such are those of the fingers which arise from chronic inflammation and permanent contraction of the palmar aponeurosis, or fascia, a strong inelastic and fibrous membrane attached to the projecting points of bone, and stretched beneath the skin of the palm for the protection of the nerves and other soft parts during the act of forcible grasping. There is a similar aponeurosis in the sole of the foot, which is subject, but not so frequently, to the same shortening. Under this division may be also classed those distortions which arise from burns and other extensive destructions and ulcerations of the skin, in consequence of the contraction of the scar in the process of healing. When these injuries take place in the front of the neck and face, the resulting deformity is sometimes frightful. The space between the chin and the breast is filled up by a tense discoloured and corrugated cicatrix, which bows the head forward and draws down the features so as to expose the inner surface of the lower eyelid and keep the mouth constantly open. When they occur in the flexures of the joints, as in front of the elbow, the cicatrix extends in the form of a hard and rigid web between the humerus and fore-arm, the joint being permanently bent. Such deformities may sometimes be partly removed by an operation; but it is extremely painful, and often unsuccessful.

2. A slight injury of the face below the eye, or the simple contraction from some other cause of the skin of that part may produce the deformity called *ectropium*, or eversion of the lower lid; and the opposite state of inversion (*entropium*, or *trichiasis*) may result from a similar contraction of the edge of the eyelid itself. Severe inflammation, and even blindness, may be the consequence of the latter affection from the friction of the lashes against the globe. Both of these deformities may be remedied by a slight operation.

IV. Another class of distortions may arise from external pressure; as of the bones and cartilages of the chest from tight stays; or of the phalanges of the toes from ill-made shoes. Instances of this kind of distortion must be familiar to all: and call for no particular explanation or remark.

DISTRESS, 'districtio,' in the jurisprudence of the Middle Ages, denotes legal compulsion generally, whether ecclesiastical or civil. One mode of compulsion extensively adopted among the nations of Teutonic origin was the taking possession of the whole or a part of the property of the offender or defaulter, and withholding it from him until the requirements of the law had been complied with. This species of distress was called 'naam,' from *nymen*, *nehmen*, to take—a verb common to the Anglo-Saxon, German, and other cognate languages. The modern distress is the 'naam,' restricted to the taking of *personal* chattels; and in its most simple form it may be stated to be—the taking of personal chattels out of the possession of an alleged defaulter or wrong-doer for the purpose of compelling him, through the inconvenience resulting from the withholding of such personal chattels, to perform the act in respect of which he is a defaulter, or to make compensation for the wrong which he has committed.

Some rights to which the law annexes the remedy by distress, have been considered as too important to be left to the protection afforded by the mere detention of the *distress* (by which term the thing taken is also designated),

and more efficacious means of dealing with it have been introduced; and in certain cases a sale of the property taken by way of distress is allowed, if, after a certain interval, the party distrained upon continues to be unwilling or unable to do the act required.

Distresses are either for some duty omitted, some default or nonfeasance,—or they are in respect of some wrongful act done by the distressee.

I. *As to distresses for omissions, defaults, or nonfeasance.*

—These may be grounded upon noncompliance with some judicial requirements, or they may be made by private individuals in vindication of certain rights, for the withholding of which the law has entrusted them with this remedy.

The process out of courts of record ordering such distresses to be made is called a writ of *distringas*, which, when legal proceedings were in Latin, was the word used to direct the sheriff or other officer to make the distress.

Another class of judicial distresses is where, upon refusal or omission to pay a sum in which a party is convicted upon a summary proceeding before justices of the peace, such justices are empowered to grant a warrant authorizing and directing the levying of the amount by distress and sale of the goods of the offender.

Another species of judicial distress is that awarded and issued upon a judgment recovered in an inferior court, not of record. In these cases the execution or remedy for obtaining payment of the sum recovered is by distress. A precept issues to the officer of the court, commanding him to take the goods of the party, and to impound them until he satisfies the debt. Such process issues at the command of the sheriff or of the lord of the manor, &c., in whose name and by whose authority the courts are holden.

So a distress lies, subject to certain restrictions, for fines and amercements imposed in the sheriff's tourn and in a court-leet. [LEET; TOURN.]

A penalty inflicted for the breach of a bye-law [BYE LAW] may be levied by distress, in cases where that remedy is appointed at the time of the making of the particular bye-law. But a bye-law establishing a distress cannot authorize the sale of the distress.

Another species of judicial distress is a distress taken for poor-rates. [POOR.]

In the foregoing cases the right or duty withheld has been ascertained by some judicial determination before a distress can be resorted to. But many payments and duties having their origin in feudal rights, may be enforced by distresses taken by the sole authority of the parties claiming such payments or duties. The rights, of which the vindication is thus in the first instance entrusted to the parties themselves, are connected immediately or mediately with feudal superiority; and it is observable that to feudal superiority, jurisdiction and magisterial authority were always incident.

Among the feudal duties which may be enforced by distress, at the mere will of the party claiming to be entitled to such duties, one which though seldom exacted, is still of the most extensive obligation, is fealty. Fealty is a promise confirmed by an oath, to be faithful in the performance of those engagements into which the party doing the fealty (as the act of taking the oath is termed) has expressly or impliedly entered upon becoming tenant to the party receiving the fealty.

A distress also lies for suit of court, *secta ad curiam*, or the attendance which freehold tenants owe to their lord's court-baron, or freeholders'-court, and which tenants in villenage or copyholders owe to the lord's customary court; and it is not unusual for lessees for years to covenant to attend the lord's courts, though unless they also fill the situation of freeholders of the manor, they are not qualified to sit as suitors and judges in the court baron; and unless they are copyholders they cannot be sworn upon the homage or jury in the customary court. This suit is sometimes called *suit-service*, to distinguish it from suit real, which is that suit of court which the residents, or those who dwell within a hundred or a leet, owe to the sheriff's tourn or to the court-leet. [LEET; SUIT.]

A distress lies for suit of mill (*secta ad molendinum*), an obligation, still existing in some manors, to grind at the lord's mill.

So for frankfoldage, or a right in the lord to require his tenants to fold their sheep upon his lands.

So, if land be holden by the tenure of repairing a bridge, or a highway, or of doing suit to a leet, or filling some office

within the leet, a distress will lie for nonperformance of the service, although no fine or amercement may have been imposed in the court leet.

The most important feudal duty for which a distress may be taken is *rent*. Rent, in its original and still most usual form, is a payment rendered by the tenant to his landlord as an equivalent or a compensation for the occupation of land, &c. Such rent is denominated *rent-service*. It comes in lieu of, and represents the profits of the land granted or demised, and is therefore said to *issue* out of the land. To rent-service the law annexes the power of distress, although there be no agreement between the parties creating that remedy. But a rent reserved upon a grant or demise ceases to be a rent-service if it be disannexed from the ultimate property in the land, called in some cases the reversion, in others, the right of reverter. Thus, if the owner of land in fee demises it for a term of years, reserving rent, and afterwards assigns the rent to a stranger, retaining the reversion, or grants the reversion, retaining the rent, the rent being disconnected from the reversion is considered as a branch severed from the trunk, and is called a dry rent or rent-seek, to which the common law annexed no power of distress. So, if the owner of the land, without parting with the land, grants to another a rent out of the land, the grantee having no reversion had only a rent-seek, unless the grant expressly created a power of distress, in which case the rent would be a rent-charge. But now, by statute 4 Geo. II. c. 28, s. 5, the like remedy by distress is given in cases of rent-seek, as in the case of rent reserved upon lease.

And as all rents, though distinguished by a variety of names derived from some particular circumstance attached to them, are resolvable into rent-service, rent-seek, or rent-charge, a distress lies at this day for every species of rent, though a practical difference still subsists as to the mode of dealing with distresses taken for the one or for the other. As to the several species of rent, and as to the creation, transfer, apportionment, suspension, and extinction of rents, and as to the estate or interest of the party necessary to support a distress for rent, and as to the cases in which this remedy may be exercised by the personal representatives of such parties, see *RENT*.

A heriot appears to have been originally a voluntary gift by the dying vassal to his chieftain or lord (*herr*, *herus*) of his best horse or armour. It has now become a legal liability to deliver the best animal of the deceased tenant to be selected by the lord, or sometimes a dead chattel or a commutation in money. Where heriot is due by usage within a particular district, in respect of all tenants dying within that district, without reference to the property held, it is heriot-custom; and as there is no particular land charged with the heriot, the lord cannot distrain, but may seize the heriot as his own *property*, his election being determined by the bare act of seizure. But heriot due in respect of the estate of the tenant in the land is heriot-service; and for this the lord may either distrain upon the land to compel the tenant to deliver or procure the delivery of the heriot due upon the death of his predecessor, or he may choose for himself, and seize the heriot as his own property (the right of property vesting here also upon the election exercised and signified by the seizure).

As heriot is something rendered upon the death of a tenant, so relief is a payment made by the heir upon the taking up (*relevatio*) by him of the inheritance. Strictly speaking, relief was payable in those cases only where the tenure was by knight's service. But the name was afterwards extended to a payment in the nature of a relief made by the heir in socage, by doubling the rent for the first year after the descent of the land.—in other words by paying one year's additional rent. For this payment a distress lies.

Toll is a charge or impost upon goods in respect of some benefit conferred or right forborne with relation to those goods, by the party claiming such toll.

Tolls of fairs or markets are a duty payable to the owners of the fair or market as a compensation for the mischief done to the soil by the holding of such fair or market.

Toll-traverse is a compensation paid in some cases to the owner of the soil in respect of the transit or passage of goods.

Toll-thorough is a toll for the transit of goods along a street or highway repaired by the party claiming the toll.

Port-tolls, more commonly called port-duties, are tolls payable in respect of vessels coming to or sailing from a port or a wharf of which the parties claiming the tolls, or those from whom they derive their title to such tolls, are the owners.

In all these cases if the toll be withheld, any part of the

property chargeable therewith, may be seized and detained as a pledge for the payment of such toll.

II. *Distress for damage-feeasant*.—Besides distresses for omissions, defaults, or nonfeasance, this remedy is given in certain cases as a mode of obtaining reparation for some wrong done by the distresses. Cattle or dead chattels may be taken and detained to compel the payment of a reasonable sum of money by way of satisfaction for the injury sustained from such cattle or dead chattels being wrongfully upon property in the occupation of the party taking them, and doing damage there, either by acts of spoliation or merely by incumbering such property. This is called a distress of things taken damage-feeasant (doing damage).

The occupier of land, &c., is allowed not only to defend himself from injury by driving out or removing the cattle, &c., but also to detain the thing which did the injury till compensation be made for the trespass; for otherwise he might never find the person who had occasioned the trespass. Upon referring to Spelman and Ducange, it will be seen that a similar practice obtained on the continent amongst the Angli, Werini, Ripuarii, and Burgundians.

The right to distrain damage-feeasant is given to all persons having an immediate possessory interest in the soil or in its produce, and whose rights are therefore invaded by such wrongful intrusion. Thus, not only the occupier of the land trespassed upon, but other persons entitled to share in the present use of the land or of the produce, as commoners, &c., may distrain. But though a commoner may always distrain the cattle, &c., of a stranger found upon the common, it would seem that he cannot, unless authorized by a special custom, distrain the cattle, &c., of the person having the actual possession of the soil. Nor can he distrain the cattle of another commoner who has stocked beyond his proportion, unless the common be stinted, i. e. unless the proportion be limited to a certain number. In the more ordinary case of rights of common in respect of all the cattle which the commoner's enclosed land can support during the winter, cattle exceeding the proportion cannot be distrained.

Cattle found trespassing may be distrained damage-feeasant, although they have come upon the land without the knowledge of their owner and even through the wrongful act of a stranger. But if they are there by the default of the occupier of the land, as by his neglecting to repair his fences, or to shut his gates against a road or a close in which the cattle lawfully were, such negligent occupier cannot distrain unless the owner of the cattle suffer them to remain on the land after notice and time given to him to remove them; and if cattle trespass on one day and go off before they are distrained, and are taken trespassing on the same land on another day, they can be detained only for the damage done upon the second day.

Cattle, if once off the land upon which they have trespassed, though driven off for the purpose of eluding a distress, cannot be taken even upon immediate pursuit. The occupier is left to his remedy by action.

III. *What may be distrained*.—Not only cattle and dead chattels, but wild animals in which no person has any property may be distrained damage-feeasant. In distresses for rent and other duties, that which is taken must be something in which a valuable property may exist. But animals of a wild nature, if reclaimed and become valuable (as deer kept in a private park), may be distrained. Whether animals reclaimed for the purpose of pleasure only can be distrained appears to admit of doubt. Lord Coke mentions dogs among the animals upon which no distress can be taken; but in the old work called the Mirror, to which he refers, the restriction would appear to be confined to cases where other distress could be taken.

Fixtures and growing crops not being personal chattels were not at common law subject to distress. But it would appear that those fixtures which are removable, as between landlord and tenant, would be also liable to be taken as a distress; and by 11 Geo. II. c. 19, s. 8, distress for rent-service may be made of all sorts of corn and grass, hops, roots, fruit, pulse, or other product whatsoever growing in any part of the land demised.

By the common law nothing could be distrained upon for rent or other duty that could not be restored in as good plight as at the time of the distress being taken; and therefore fruit, milk, and other matters of a perishable nature could not be distrained, nor money unless in a bag, because the identical pieces could not be known so as to be restored to the distressee; nor could grain or flour be taken

if out of the sack, or hay not being in a barn, or corn in the sheaf, because the quantity could not be easily ascertained, and they might be scattered or injured by the removal. None of these could be taken as a distress except for damage-feasant, though the same articles when contained in bags, boxes, carts, or buildings might be distrained upon for rent. But now by 2 W. & M. sess. 1, c. 5, s. 3, distress may be made of sheaves or cocks of corn, or corn loose or in the straw, or hay lying or being in any barn or granary, or upon any hovel, stack or rick, or otherwise, upon any part of the land.

Where a stranger's cattle are found upon the tenant's land they may be distrained upon for rent-service, provided they are there by the act or default of the owner of such cattle. If they come upon the land with the knowledge of their owner, or by breaking fences which are in repair, or which neither the landlord nor the tenant is bound to repair, they are immediately distrainable; but if they come in through defect of fences which the lord or tenant is bound to repair, the lord cannot take them for rent reserved upon a lease until they have lain for a night upon the land, nor until after notice given to the owner, if he can be discovered, to remove them. But in the case of a lord not bound to repair the fences distraining for an antient rent or service, and also in the case of a rent-charge, the cattle may be taken, after they have lain a night upon the land, without notice to their owner.

Things necessary for the carrying on of trade, as tools and utensils,—or for the maintenance of tillage, as implements of husbandry, beasts of the plough, and sheep as requisite to manure the land, are privileged from distress whilst other sufficient distress can be found. But this rule does not extend to a distress for a toll or duty arising in respect of the thing taken as a distress, or of things connected with it; as a distress of two sheep for market-toll claimed in respect of the whole flock, or of the anchor of a ship for port-duty due in respect of such ship.

For the protection of tradesmen and their employers in the necessary transactions of society, property of which the distrainee has obtained the possession with a view to some service to be performed upon it by him in the way of his trade, is absolutely privileged from distress; as a horse standing in a smith's shop to be shod, or put up at an inn, or cloth sent to a tailor's shop to be made into clothes, or corn sent to a mill or market to be ground or sold. The goods of a guest at an inn are privileged from distress; but this exemption does not extend to the case of a chariot standing in the coach-house of a livery-stable keeper; nor does it protect goods on other premises belonging to the inn but at a distance from it; and even within the inn itself the exemption does not extend to the goods of a person dwelling there as a tenant rather than a guest. Goods in the hands of a factor for sale are privileged from distress; so goods consigned for sale, landed at a wharf, and placed in the wharfinger's warehouse.

Beasts of the plough may be distrained where no other distress can be found. And it is sufficient if the distrainer use diligence to find some other distress. A distress is not said to be found unless it be accessible to the party entitled to distrain, the doors of the house being open, or the gates of the fields unlocked. Beasts of the plough may be distrained upon where the only other sufficient distress consists of growing crops, which though now subjected to distress, are not, as they cannot be sold until ripe, immediately available to the landlord.

A temporary privilege from distress arises when the chattel is in actual use, as an axe with which a man is cutting wood, or a horse on which a man is riding. Implements in trade, as frames for knitting, weaving, &c., are absolutely privileged from distress whilst they are in actual use, otherwise they may be distrained upon if no other sufficient distress can be found.

By 7 Ann. c. 12, s. 3, process whereby the goods of any ambassador or other public minister of any foreign prince or state, or of their domestic servants, may be distrained, seized, or attached, is declared to be null and void. But the privilege of a domestic servant of an ambassador does not invalidate a distress for the rent, rate, or taxes of a house occupied for purposes unconnected with the service.

By 6 Geo. IV. c. 16, s. 74, no distress for rent made and levied after an act of bankruptcy upon the goods of any bankrupt shall be available for more than one year's rent accrued prior to the date of the fiat; but the party to

whom the rent is due shall be allowed to come in as a creditor for the overplus of the rent due, and for which the distress shall not be available.

Where a tenancy for life or at will is determined by death or by the act of the landlord, the tenant, or his personal representatives, may reap the corn sown before such determination, and therefore such corn though sold to a third person, cannot be distrained upon for rent due from a subsequent tenant. [EMBLEMENTS.]

Neither the goods of the tenant nor those of a stranger can be distrained upon for rent if they are already in the custody of the law, as if they have been taken damage-feasant, or under process of execution. But although the landlord cannot distrain, yet by 8 Ann. c. 14, he has a lien or privilege upon the goods of his tenant taken in execution for one year's rent. [EXECUTION.]

IV. *Time of making a distress.*—Rent is not due until the last moment of the day on which it is made payable. No distress therefore can be taken for it until the following day. And as a continuing relation of landlord and tenant is necessary to support a distress for rent-service, there could at common law be no distress for rent becoming due on the last day of the term. But now, by 8 Ann. c. 14, s. 6 and 7, any persons having rent in arrear upon leases for lives, for years, or at will, may, after the determination of such lease, distrain for the arrears, provided that such distress be made within six calendar months after the determination of the lease and during the continuance of the landlord's title or interest, and the possession of the tenant from whom such arrears are due. If the possession of the tenant continue in fact, it is immaterial whether that possession be wrongful and adverse, or whether it continues by the permission of the landlord; and if a part only of the land remain in the possession of the tenant, or of any person deriving his possession from the tenant, a distress for the whole of the arrears may be taken in such part during the six months. Where a tenant is entitled by the terms of his lease, or by the custom of the country, to hold over part of the land or buildings for a period extending beyond the nominal term, the original tenancy will be considered as continuing with reference to the land, &c. so retained, and the landlord may distrain at common law for the arrears during such extended period in the lands, &c. so held over, and he may distrain under the statute during six months after such partial right of possession has entirely ceased.

When different portions of rent are in arrear the landlord may distrain for one or more of those portions, without losing his right to take a subsequent distress for the residue; so, although the first distress be for the rent last due. But if there be a sufficient distress to be found upon the premises, the landlord cannot divide a rent accruing at one time into parts, and distrain first for a part and afterwards for the residue. If however he distrain for the entire rent, but from mistaking the value of the goods takes an insufficient distress, it seems that a second distress for the deficiency will be lawful although there were sufficient goods on the premises to have answered the whole demand at the time of the first taking; and it is clear that he may take such second distress upon goods which have come upon the premises subsequently to the first taking, if in the first instance he distrain all the goods then found thereon and for the entire rent, the amount of which exceeds the value of the goods first taken.

A distress for rent or other duties or services can be taken only between sunrise and sunset; but cattle or goods found, damage-feasant may be distrained at any time of the day or night.

By the common law the remedy by distress was in general lost upon the death of the party to whom it accrued. But the king and corporations aggregate never die; and as the law authorizes a surviving joint tenant to act as if he had been originally the sole owner, he may distrain for rent or other services accruing in the lifetime of his companion.

The statutes of 32 H. VIII. c. 37, and 3 and 4 W. IV. c. 42, have extended the remedy by distress to husbands and executors in respect of rent accruing due to their deceased wives or testators. [RENT.]

No distress can be taken for more than six years' arrears of rent; nor can any rent be claimed where non-payment has been acquiesced in for twenty years, 3 and 4 W. IV. c. 27.

V. *In what place a distress can be made.*—The remedy being given in respect of property, not of the person, a distress for rent or other service could at common law be

taken only upon the land charged therewith, and out of which such rent or services were said to issue.

But this restriction did not apply to the king, who might distrain upon any lands which were in the actual occupation of his tenant, either at the time of the distress or when the rent became due.

The assumption of a similar power by other lords was considered oppressive, and it was ordained by the statute of Marlbridge, that no one should make distress for any cause out of his fee, except the king and his ministers thereunto specially authorized. The privilege of distraining in all lands occupied by the party chargeable, is communicated by 22 Car. II. c. 6; 26 Geo. III. c. 87; 30 Geo. III. c. 50; and 34 Geo. III. c. 75, to the purchasers of certain crown rents.

At common law if the tenant or any other person seeing the lord or his bailiff come to distrain for rent or other service, drove the cattle away from the land holden, they might be distrained off the land. Not so when the cattle without being driven went off before they were actually taken, though the lord or bailiff saw the cattle upon the land (which for some purposes is a constructive possession). Nor if after the view the cattle were removed for any other purpose than that of preventing a distress. On the other hand, cattle of which the lord or bailiff has no view whilst they are on the land, although the tenant drove them off purposely to avoid a distress, could not be distrained.

Under 8 Ann. c. 14, and 11 Geo. II. c. 19, where a lessee fraudulently or clandestinely carries off his goods in order to prevent a distress, the landlord may within five days afterwards distrain them as if they had still continued on the demised premises; provided they have not been (*bonâ fide*) sold for a valuable consideration.

And by the 7th section of the latter statute, where any goods fraudulently and clandestinely carried away by any tenant or lessee, or any person aiding therein, shall be put in any house or other place, locked up or otherwise secured, so as to prevent such goods from being distrained for rent, the landlord or his bailiff may, in the day time, with the assistance of the constable or peace officer (and in case of a dwelling-house, oath being also first made of a reasonable ground to suspect that such goods are therein), break open and enter into such house or place, and take such goods for the arrears of rent, as he or they might have done if such goods had been put in an open field or place.

To entitle the landlord to follow the goods, the removal must have taken place after the rent became due, and for the purpose of eluding a distress. It is not however necessary that a distress should be in progress, or even contemplated. Nor need the removal be clandestine. Although the goods be removed openly, yet if goods sufficient to satisfy the arrears are not left upon the premises, and the landlord is turned over to the barren remedy by action, the removal is fraudulent and the provisions of these statutes may be resorted to. These provisions apply to the goods of the tenant only. The goods of a stranger or of an under-tenant may be removed at any time before they are actually distrained upon, and cannot be followed.

Where two closes are let by separate demises and separate rents, though such demises be made at the same time and are even contained in the same deed, a distress cannot be taken in one close for both rents.

If a rent-charge or rent-service also issue out of land which is in the hands or separate possession of two or more persons, a distress may be taken for the whole rent upon the possession of any one of them.

The lord may enter a house to distrain if the outer door be open, although there be other sufficient goods out of the house. It is not lawful to break open outer doors or gates; but if the outer door be open, an inner door may be forced. And where the lord having distrained is forcibly expelled, he may break open outer doors or gates in order to retake the distress. If a window be open, a distress within reach may be taken out at it.

At common law a distress might be taken for rent in a street or other highway being within the land demised. But now, by the statute of Marlbridge, private persons are forbidden to take distresses in the highway. This statute applies only to distresses for rent or for services and not to toll. Nor does the statute make the distress absolutely void; for though the tenant may lawfully rescue cattle distrained in the highway, or may bring his action on the case upon the statute, yet if he brings trespass or replevin, it seems to be no answer to a justification or an avowry made in respect of the rent.

No rent can be reserved out of an incorporeal hereditament; and therefore at common law the lord could not distrain for rent in a place in which the tenant had merely an incorporeal right—as a right of common. By 11 Geo. II. c. 19, s. 8, landlords are enabled to take a distress for rent upon cattle belonging to their tenants feeding upon any common appendant or appurtenant to the land demised. But in cases not within this enactment, the rule of the common law applies; and therefore upon a demise of a wharf and the appurtenances, with liberty to land and load goods, the landlord cannot distrain the tenant's barges lying opposite and attached to the wharf.

VI. *Mode of making a distress.*—A distress may be made either by the party himself or his agent, and as distresses in manors were commonly made by the bailiff of the manor, any agent authorized to distrain is called a bailiff. The authority given to the bailiff is usually in writing, and is then called a warrant of distress; but a verbal authority, and even the subsequent adoption of the act by the party on whose behalf the distress is made, is sufficient. In order that the distrainee may know what is included in the distress, an inventory of the goods should be delivered, accompanied, in the case of a distress for rent, by a notice stating the object of the distress, and informing the tenant that unless the rent and charges be paid within five days, the goods and chattels will be sold according to law. This notice is required by 2 W. & M., sess. i. c. 5, s. 2, which enacts, 'that where any goods shall be distrained for rent due upon any demise, lease, or contract, and the tenant or owner of the goods shall not, within five days next after such distress taken, and notice thereof with the cause of such taking, left at the chief mansion house, or other most notorious place on the premises, replevy the same, with sufficient security to be given to the sheriff,—that after such distress and notice and expiration of the five days, the person distraining shall and may, with the sheriff or under-sheriff, or with the constable of the place, cause the goods to be appraised by two sworn appraisers, and after such appraisal may sell the goods distrained towards satisfaction of the rent, and of the charges of distress, appraisement, and sale, leaving any surplus in the hands of the sheriff, under-sheriff, or constable, for the owner's use.'

At common law, goods distrained were, within a reasonable time, to be removed to and confined in an enclosure called a pound, which is either a pound covert, i. e. a complete enclosure, or a pound overt, an enclosure sufficiently open to enable the owner to see, and, if necessary, to feed the distress, the former being proper for goods easily removed or injured, the latter for cattle; and by 5 and 6 Will. IV. c. 59, s. 4, persons impounding cattle or animals in a common open or close pound, or in enclosed ground, are to supply them with food, &c., the value of which they may recover from the owner. By 11 Geo. II. c. 19, s. 10, goods distrained for any kind of rent may be impounded on any part of the tenant's ground, to remain there five days, at the expiration of which time they are to be sold, unless sooner replevied. The landlord is not however bound to remove the goods immediately after the expiration of the five days; he is allowed a reasonable time for selling. After the lapse of a reasonable time he is a trespasser if he retain the goods on the premises without the express assent of the tenant, which assent is generally given in writing.

The 1 and 2 Ph. & M., c. 12, requires that no distress of cattle be removed out of the hundred, except to a pound overt in the same county, not above three miles from the place where such distress is taken, and that no cattle or other goods distrained at one time be impounded in several places, whereby the owner would be obliged to sue out several replevins.

The 2 Will. & Mary, sess. 1, c. 5, s. 3, directs that corn, grain, or hay distrained be not removed, to the damage of the owner, out of the place where the same shall be found or seized, but be kept there until replevied or sold; and 11 Geo. II. c. 19, which gives a distress for rent-service upon growing crops, directs, ss. 8 and 9, that they shall be cut, gathered, and laid up, when ripe, in the barn or other proper place on such premises, or if none, then in some other barn, &c., to be procured for that purpose, and as near as may be to the premises, giving notice within one week of the place where such crops are deposited; and if the tenant, his executors, &c., at any time before the crops distrained are ripe and cut, pay or tender the rent, costs,

and charges, the goods distrained are to be restored. In all other cases, if the rent or other duty be paid, or performed, or tendered to be paid or performed before the distress is impounded, a subsequent detainer is unlawful, and a subsequent impounding or driving to the pound is a trespass.

The statutes authorising the sale of distresses extend only to those made for rent. At common law distresses cannot in general be either sold or used for the benefit of the party distraining. But a distress for fines and amerciaments in a court leet, or for other purposes of public benefit, may be sold; and a special custom or prescription will warrant the sale of a distress in cases where the public has no immediate interest.

VII. Rights and Remedies of the Distrainee.—A distress made by a party who has no right to distrain, or made for rent or other service which the party offers to pay or perform, or made in the public highway, or upon goods privileged from distress either absolutely or temporarily, is called a *wrongful distress*. Where no right to distrain exists, or where the rent or duty is tendered at the time of the distress, the owner of the goods may rescue them or take them forcibly out of the possession of the distrainer, or bring an action of replevin, or of trespass, at his election. In replevin, the cattle or goods taken are to be redelivered to the owner upon his giving security by a replevin bond, for returning them to the distrainer, in case a return shall be awarded by the court; and therefore in this action damages are recovered only for the intermediate detention and the costs of the replevin bond. [REPLEVIN.] In the action of trespass the plaintiff recovers damages to the full value of the goods; because upon such recovery, the property in the goods is transferred to the defendant.

The 2 W. & M., sess. i. c. 5, s. 5, provides 'That in case of any distress and sale for rent pretended to be due, where a truth no rent is due, the owner of the goods so distrained and sold may, by action of trespass or upon the case, recover double the value of such goods, with full costs of suit.'

For a wrongful distress in taking goods protected by being in a street or highway, or goods privileged from distress, the remedy is by an action on the statute, in which the plaintiff is entitled to an immediate return as in replevin.

If the cattle or goods distrained cannot be found, the sheriff may take other cattle or goods in *wither-nam* (by way of counter-distress) of the same or of a different kind, belonging to the distrainer, and deliver them to the distrainee instead of his own.

Another species of wrongful distress is *recaption*, or the taking of the same or other goods of the distrainee for the same causes pending an action of replevin, in which the legality of the first distress is questioned.

Wherever a distress is wrongful, the owner of the goods may rescue them from the distrainer; but after they are actually impounded, they are said to be in the custody of the law, and must abide the determination of the law.

Whether goods are rightfully or wrongfully distrained, to take them out of the pound is a trespass and a public offence. The proceeding by action is a more prudent course than making a rescue, even before an impounding, where any doubt exists as to the lawfulness of the distress. Independently of the danger of provoking a breach of the peace by the rescuer's thus taking the law into his own hands, he will be liable to an action for the injury sustained by the distrainer by the loss of the security of the distress, should the distress ultimately turn out to be lawful; and in such action, as well as in the action for poundbreach, the rescuer will be liable, under 2 W. & M. sess. i. c. 5, s. 4, to the payment of treble damages and treble costs.

A distress for more rent, or greater services than are due, or where the value of the property taken is visibly disproportionate to the rent or other appreciable service, is called an *excessive distress*, for which the party aggrieved is entitled to recover compensation in an action on the case; but he cannot rescue, nor can he replevy or bring trespass.

Upon a distress rightfully taken being afterwards irregularly conducted, the subsequent irregularity at common law made the whole proceeding wrongful, and the party was said to be a trespasser 'ab initio'. But now, by 11 Geo. II., c. 19, where distress is made for rent justly due, and any irregularity or unlawful act is afterwards done by the party distraining or his agent, the distress itself is not to be deemed unlawful nor the party making it a trespasser; but

P. C., No. 535

the person aggrieved by such irregularity, &c., may recover satisfaction for the special damage sustained. And see Bradby on *Distresses*; Gilbert, *Dist.*; Bracton; Fleta, Coke upon Littleton; Bacon, Comyns, and Viner's *Abridgments*; Willes's *Reports*; 6 Neville and Mann 606.

DITCH. [BASTION.]

DITHMARSH (DITMARSKEN, Dan.), the most westerly of the four districts of the Danish duchy of Holstein, has the German ocean for its western boundary, and Holstein Proper for its eastern, to which last it was united in 1459. On the north the Eider separates it from the duchy of Schleswig, and on the south the Elbe divides it from the Hanoverian duchy of Bremen. Its area is about 500 square miles, and its population about 47,000. It is protected against the inroads of the sea by strong dykes, is very productive in corn, pulse, linseed, &c., and rears a considerable number of cattle. Its subdivisions are the bailiwicks of North and South Dithmarsh. North Dithmarsh has thirteen parishes and four market-towns, with a population of about 22,500. The principal town is Heyde, in the heart of the bailiwick, which has a spacious marketplace, a church, and public school, with about 2900 inhabitants, and is the seat of administration: the three other towns are Lunden, near the Eider, with a church and school, and about 430 inhabitants; Büsum, on the sea, with a church and harbour, and about 320 inh.; and Weslingburen, not far from the sea, with a church and public school, and about 640 inh. Close to the latter is Schülpe, a spot well known to navigators, at the mouth of the Eider. South Dithmarsh is divided into thirteen parishes, and contains four market-towns, with a population of about 24,900. The chief town is Meldorf, at the mouth of the Miele; it is well built, and was formerly fortified, has a handsome church, a grammar-school, three other schools, public gardens, and about 2020 inhabitants. The other towns are Wörden, on an arm of the sea, with a small harbour, a church, public school, and about 850 inhabitants; Brunsbüttel, on the Elbe, across which there is a royal ferry, with a church, custom-house, a public school, and about 1500 inhabitants; and Marne, with a church and public school, and about 750 inhabitants.

DITHYRAMBUS, the name of a hymn in honour of Bacchus, sung by a chorus of fifty men or boys as they danced round the blazing altar of the god: from this peculiarity it was also called the *cyclic* or *circling* chorus. The original subject of the song was the birth of Bacchus, as the name seems to have implied. (Plato, *Legg.* iii.) The music was Phrygian, and the accompaniment originally the flute. (Aristot. *Polit.* viii. 7, 9.) The Dithyrambus is particularly interesting from the circumstance that Aristotle attributes to it the origin of the Greek tragedy. 'Tragedy and comedy,' says he (*Poet.* iv. 14), 'having originated in a rude and unpremeditated manner, the first from the leaders in the Dithyrambic hymns, the other from the Phallic songs, advanced gradually to perfection.' These leaders (*ἡδῶνχορὸς*), and not as has been wrongly inferred from the words of Aristotle, the whole chorus, recited trochaic tetrameters, and are to be considered as the immediate predecessors of the actors. [DRAMA.] In the Appendix to Welker's *Treatise on the Trilogy (Nachtrag zur Schrift über die Aeschylische Trilogie, p. 228, and following)*, the reader will find a learned disquisition on the Dithyrambus, deformed however by some serious errors. After the leading properties of the Dithyrambus had merged in the Greek tragedy, it became very bombastic, and in the Greek and even in modern languages the epithet Dithyrambic is a synonym for turgid and hyperbolic expressions. The etymology of the word is unknown.

DITRU'PA, a genus of Annelids, founded by the Rev M. J. Berkeley, and which, from its having been previously confounded with the species of an entirely distinct genus (*Dentalium*), and some circumstances respecting its capture in a living state, requires particular notice.

Generic Character.—*Shell*, free, tubular, open at both ends. *Operculum* fixed to a conical pedicellated cartilaginous body, thin, testaceous, concentrically striate.

Branchiae, twenty-two in two sets, not rolled up spirally flat, broadest at the base, feathered with a single row of cilia. *Mantle* rounded behind, slightly crisped, denticulated in front, strongly puckered on either side.

Fascicles of bristles, six on each side. (Berkeley.)

Mr. Berkeley states that a few of the specimens of sand, gravel, &c. from different parts of the great bank running

VOL. IX.—F

parallel with the north-west coast of Ireland, obtained by Captain A. Vidal, R.N., during the extensive soundings made by that officer in the summer of 1830, whilst in search of Aitkin's Rock, were placed in his hands, when he found among them several specimens of the shell of a testaceous animal, which proved to be the *Dentalium subulatum* of Deshayes, and identical with the Madeira specimens, the only points of difference being a paler hue, and an almost total absence of the constriction near the orifice, the former being, as Mr. Berkeley observes, exactly such as might be expected from the occurrence of the species in a higher latitude, and the latter so variable as not to throw any doubt on its specific identity. Having previously been convinced, from Mr. Lowe's specimen, that the animal was not a *Dentalium*, but an *Annelid*, Mr. Berkeley requested Captain Vidal to preserve in spirit during the following summer, when operations on the bank were to be resumed, whatever animals he should procure alive in sounding, and, if possible, specimens of the so-called *Dentalium*, at the same time noting the depth at which they were taken. The result was the capture of the shell with the included animal, which enabled Mr. Berkeley to establish the genus named at the head of this article. The animals of the Madeira and British specimens proved to be perfectly identical.

Habits, depth, &c.—It appears from Mr. Berkeley's paper, that the shells first handed to him by Captain Vidal occurred in fine sand, at various distances from the coast, in lat. 55°, at great depths—from 60 to 120 fathoms. After speaking of the animals preserved in spirit, and stating that Captain Vidal noted the depth at which each specimen was taken, Mr. Berkeley remarks that the so-called *Dentalium* did not occur at any less depth than 63½ fathoms, and twice (on one occasion off St. Kilda) it occurred at 171 fathoms. Nothing could be concluded as to habit, from the manner in which the shells were imbedded in the tallow (with which the lead was armed); but this was of the less consequence, says Mr. Berkeley, because it had appeared, from Mr. Lowe's information, that the animals are found in great numbers together, in masses of a conglomerate (if it may be so called) of mud and various marine substances, the broader end only appearing above the surface. Mr. Berkeley infers, from the great difference in the diameter, that the narrow or posterior end is gradually absorbed in the course of growth.

Geographical Distribution.—Madeira, British seas, and probably a much more extensive range.

Place in the Animal Series.—Mr. Berkeley is of opinion that, notwithstanding the resemblance of the shell to that of true *Dentalia*, it is most nearly allied to *Serpula*; but evidently distinct, in having an unattached shell (for there is no evidence to lead to a suspicion that it is attached, even in infancy), and especially in possessing a posterior as well as anterior aperture. He thinks that other species of so-called *Dentalia* may be found to belong to the genus *Ditrupa*. One at least, he observes, does so belong, viz., *Dentalium Gadus*, Mont. (*Dent. coarctatum*, Lam.). Mr. Berkeley thinks it highly probable that the other minute British *Dentalia* will prove to possess an animal of like structure, though possibly, even in that case, it would be requisite to place them in a distinct genus.

Ditrupa subulata, magnified.

a, the animal; b, one of the branches; c, a portion of the anterior part of the mantle; d, operculum. (*Zool. Journ.* vol. v.)

Example. *Ditrupa subulata*, Berke.ey; *Dentalium subulatum*, Deshayes.

DITTANY OF CRETE, the common name of the wooll-lapate plant called *Origanum Dictamnus* or *Amaracus Dictamnus*.

DITTON, HUMPHREY, an eminent divine and mathematician, was born at Salisbury, May 29, 1675. He was an only son; and manifesting good abilities for learning, his father procured for him an excellent private education. It does not appear that he was ever at either of the universities, a circumstance owing, probably, to the religious principles of his parents. Contrary, it is understood, to his own inclination, but in conformity with his father's wishes, he chose the profession of theology; and he filled a Dissenting pulpit for several years at Tunbridge with great credit and usefulness.

His constitution being delicate, and the restraints of his father's authority being removed—he also having married at Tunbridge—he began to think of turning his talents into another channel. His mathematical attainments having gained for him the friendship of Mr. Whiston and Dr. Harris, they made him known to Sir Isaac Newton, by whom he was greatly esteemed, and by whose recommendation and influence he was elected mathematical master of Christ's Hospital. This office he held during the rest of his life, which, however, was but short, as he died in 1715, in the 40th year of his age.

Ditton was highly esteemed amongst his friends; and great expectations were entertained that he would have proved one of the most eminent men of his time. He however attained a high degree of celebrity, and published several works and papers of considerable value, of which the following list contains the principal.

1. On the Tangents of Curves, &c., 'Phil. Trans.,' vol. 23.
2. A Treatise on Spherical Catoptrics, in the 'Phil. Trans.' for 1705; from whence it was copied and reprinted in the 'Acta Eruditorum,' 1707.
3. General Laws of Nature and Motion, 8vo. 1705. Wolfius mentions this work, and says that it illustrates and renders easy the writings of Galileo, Huygens, and the 'Principia' of Newton.
4. An Institution of Fluxions, containing the first Principles, Operations, and Applications of that admirable Method, as invented by Sir Isaac Newton, 8vo. 1706.
5. In 1709 he published the 'Synopsis Algebraica' or John Alexander, with many additions and corrections.
6. His 'Treatise on Perspective' was published in 1712. In this work he explained the principles of that art mathematically; and besides teaching the methods then generally practised, gave the first hints of the new method, afterwards enlarged upon and improved by Dr. Brook Taylor, and which was published in the year 1715.
7. In 1714 Mr. Ditton published several pieces, both theological and mathematical, particularly his 'Discourse on the Resurrection of Jesus Christ' and the 'New Law of Fluids, or a Discourse concerning the Ascent of Liquids, in exact Geometrical Figures, between two nearly contiguous Surfaces.' To this was annexed a tract to demonstrate the impossibility of thinking or perception being the result of any combination of the parts of matter and motion: a subject which was much agitated about that time. To this work was also added an advertisement from him and Mr. Whiston concerning a method for discovering the longitude, which it seems they had published about half a year before. This attempt probably cost our author his life; for though it was approved and countenanced by Sir Isaac Newton before it was presented to the Board of Longitude, and the method has since been successfully put in practice in finding the longitude between Paris and Vienna, yet that board determined against it. The disappointment, together with some ridicule (particularly in some verses written by Dean Swift), so far affected his health, that he died in the ensuing year, 1715.

In the account of Mr. Ditton, prefixed to the German translation of his discourse on the Resurrection, it is said that he had published, in his own name only, another method for finding the longitude; but this Mr. Whiston denied. However, Raphael Levi, a learned Jew, who had studied under Leibnitz, informed the German editor that he well knew that Ditton and Leibnitz had made a delineation of a machine which he had invented for that purpose, that it was a piece of mechanism constructed with many wheels like a lock, and that Leibnitz highly approved

or it for land use, but doubted whether it would answer on shipboard, on account of the motion of the ship.

DIURETICS are agents which augment the urinary secretion and facilitate its expulsion from the bladder. They constitute an extensive class of substances which, however, are very uncertain in their action, and require to be varied very frequently on account of the effects which their long continued use produces on the stomach and digestive function. The uncertainty of their operation is owing probably less to causes inherent in them than to our want of acquaintance with or attention to the circumstances which influence their action. Some writers disavow their belief in the existence of a distinct class of substances entitled to be called diuretics, considering them as mere general stimulants; but such a view is inadmissible, as many of them, far from being stimulants, are decidedly sedative, while some of the feelings which cause diuresis, such as fear or terror, and the external application of cold, are likewise sedative in their effects on the system.

In attempting to ascertain or account for their mode of action, we must constantly bear in mind the nature of the functions of the kidneys, viz., not only to remove from the body a considerable quantity of its fluid contents, but at the same time a great number of saline and other principles, the retention of which, for any considerable time, in the system, causes serious departure from its healthy state, and in some instances speedy death. Not only therefore must the quantity of fluid eliminated be in due proportion, but the quality or chemical constitution of it must also be of a proper kind. Any variation in these conditions requires the interference of medicine to rectify it. In endeavouring to accomplish this object, it must be borne in mind that, according to the state of the system, sometimes an acid diathesis predominates, sometimes an alkaline. The means which we employ to attain our object may be classified according to their primary modes of action on the system. Some are stimulant, such as gamboge, cyttisus scoparius, alcohol, spiritus atheris nitrici, oil of juniper, oil of turpentine, &c. Some, again, are sedative, such as lactuca virosa, leontodon taraxacum, digitalis, squil, colchicum, &c.: others are refrigerant, of which some render the urine acid, such as the diuretic mineral acids; some, on the opposite hand, render the urine alkaline, such as the carbonate of potass, acetate, tartrate and bitartrate of potass; while certain saline diuretics do not render it either acid or alkaline, such as nitrate of potass, bichlorate of soda, &c.

The more acrid diuretics seem to act upon the lower sphere of life, or what may be considered the vegetative system, such as the cellular tissue, the fatty structures, and the internal mucous coats, the secretion of which they render thinner as well as more abundant, but at the same time they interfere much with the assimilative process as well as with that of digestion, even when given in small doses; and hence arises the impossibility of prolonging their employment beyond a very limited time. Whatever be the agent we select it is by no means necessary that, to cause a diuretic effect, the substance should be decomposed; but it is important to remember that, when saline diuretics are decomposed, the alkali is carried to the kidneys as the emunctory by which it is to be ejected from the system, and hence their use speedily renders the urine alkaline, which, when in a high degree, may prove very hurtful to the system generally, and to the bladder and urinary passages in particular.

Numerous as are the agents termed diuretics, none of them will act as such unless the patient be under certain conditions. If a very inflammatory state of the system exist, no article will act as a diuretic till this be lessened, and hence the necessity of employing venesection and saline cathartics before administering any of the class of diuretics; and under such circumstances colchicum is perhaps the best to begin with. Even such inflammation as exists in some forms of dropsy must be removed by antiphlogistic means before diuretics will have a beneficial effect. (*Black-wall on Dropsy.*)

When a very great quantity of fluid is present in the body, some of it must be carried off by other means before diuretics can act, as the absorbents under such circumstances do not furnish a supply to the kidneys—the activity of absorption being always in an aversive ratio to the smallness of the quantity of fluid present. (*Majendie.*) If there be great general debility of the system, and particularly of the absorbents, this state must be obviated either by the exhibition of tonics previous to or along with the diuretic remedies. Lastly none of

the saline diuretics, which are susceptible of decomposition, will act, if any considerable catharsis be going on, and hence that action, if arising from other causes, should be moderated or checked; and care should be taken not to exhibit such of them as are also purgatives in such doses as to act upon the bowels. This observation is not intended to prohibit the exhibition of a single purgative previous to commencing the use of diuretics, as this is often beneficial, or to forbid their occasional use when required to obviate particular symptoms. It must never be forgotten that if the patient be kept very warm, the action will more probably be directed to the skin than to the kidneys; hence the patient should not, if possible, remain in bed; the medicines should be given during the day, and the air of the apartment should be cool, and the clothing light. Indeed cold itself is a powerful diuretic, and sometimes succeeds where every other fails. The drinking of diluents likewise promotes the action of the kidneys: it is therefore unwise as well as cruel to withhold water from dropical patients. [**DILUENTS.**]

DIVAN. [**DIWÂN.**]

DIVERGENCY, DIVERGENT. [**CONVERGENT.**]

DIVERS, COLYMBIDÆ, a family of swimming birds (*Natatores*), having a smooth, straight, compressed, and pointed bill.

Willughby assigned the family a place in his fifth section ('whole-footed birds, with shorter legs'),* under the name of '*Douckers* or *Loons*, called in Latine *Colymbi*,' and he divided them into 'cloven-footed *Douckers* that have no tails,' the Grebes, and the 'whole-footed *Douckers* with tails,' the true Divers. The following is Willughby's description 'of *Douckers* in general.' '*Douckers* have narrow, straight, sharp-pointed bills, small heads, and also small wings; their legs situate backwards, near the tail, for quick swimming and easier diving; broad flat legs, by which note they are distinguished from all other kinds of birds; broad claws, like human nails. Of these *Douckers* there are two kinds; the first is of such as are cloven-footed, but fin-toed, having lateral membranes all along the sides of their toes, and that want the tail: the second is of those that are whole-footed and caudate, which do nearly approach to those birds we call *Tridactylæ*, that want the back toe. These are not without good reason called *Douckers*, for that they dive much, and continue long under water, as soon as they are up dropping down again.'

Ray, in his 'Synopsis,' arranges the cloven-footed and whole-footed *Colymbi*, *Grebes*, and *Divers*, under his '*Palmipedes* tetradactylæ digito postico soluto, et primò rostro recto angusto acuto, brachyptæ et Urinatrices, *Colymbi* dictæ.' He also includes the genus *Mergulus*. [**АУК.**]

Linnaeus placed both the *Divers*, properly so-called, and the *Grebes* under his genus *Colymbus*, which stands in his system under the order *Anseres*, between the genera *Phaëton* (tropic birds) and *Larus* (gulls).

Pennant followed Brisson in separating the *Grebes* from the *Divers*. The first he placed next to the *Coots*, and immediately before the *Avosets*; and the *Divers* between the *Guillemots* and the *Gulls*.

Under the term '*Pongeurs* ou *Brachyptères*,' Cuvier arranges those *Palmipèdes*, 'a part of which have some relation to the *Water-hens*. The legs placed more backward than in any of the other birds, render walking a difficult operation, and oblige them, when on land, to keep themselves in a vertical position. As the greater part of them are, besides, had fins, inasmuch as some of them cannot fly at all on account of the shortness of their wings, they may be regarded as almost exclusively attached to the surface of the waters. In accordance with this destination their plumage is more close-set, and sometimes it even offers a smooth surface and silvery hue. They swim under the water, aiding themselves with their wings, nearly as if they were fins. Their gizzard is sufficiently muscular, their *cæca* are moderate, and they have each a peculiar muscle on each side of their lower larynx.' The following are the genera comprehended under this family by Cuvier.—the *Grebes*, Brisson; (*Podiceps*, Latham; *Colymbus*, Brisson and Illiger). The *Divers* (*Pongeurs*), properly so-called (*Mergus*, Brisson; *Colymbus*, Latham; *Eudyles*, Illiger). The *Guillemots* (*Uria*, Brisson and Illiger). The *Auks* (*Pingouins*), *Alca* of Linnaeus. The *Penguins* (*Man-*

* Willughby observes, 'Under the name of whole or web-footed we comprise some birds which have indeed their toes divided, but membranes appendant on each side: such are some of the Divers or Loons. These might more properly be denominated fin-toed, or fin-footed, than whole-footed.'

shots), *Aptenodytes* of Forster, consisting of the subgenera *Aptenodytes*, Cuvier; *Catarrhactes*, Brisson; and *Spheniscus*, Brisson.

Temminck places the Grebes (*Podiceps*) next to the *Phalaropes*, at the end of his fourteenth order, the *Pinnatipedes*, or fin-footed birds; and the *Divers* (*Colymbus*, Latham), between the *Pelicans* and the *Guillemots* in his fifteenth order, the *Palmipedes*.

Mr. Vigors makes his fifth order of birds (Natatores) comprise the following families—

Anatidæ, Leach.
Colymbidæ, Leach.
Alcadæ,
Pelecanidæ, Leach.
Laridæ, Leach.

Or, with reference to the typical groups—

Normal group.

With short wings, which are sparingly feathered, and with feet placed behind the equipoise of the body } *Colymbidæ*.
 } *Alcadæ*.

Aberrant group.

With longer and well-feathered wings, and feet especially placed within the equipoise of the body } *Pelecanidæ*.
 } *Laridæ*.
 } *Anatidæ*.

He considers the genus *Mergus*, of Linnæus, the species of which carry the powers of swimming and diving to the greatest extent, making use of their wings also in their progress through the water, and, at the same time, exhibiting a constrained and embarrassed mode of walking, in consequence of the backward position of the legs, as forming the passage from the *Anatidæ* to the *Colymbidæ*. 'The distinctively marked character,' writes Mr. Vigors, in his paper 'on the natural affinities that connect the orders and families of birds'*, of the lobated hind toe, which prevails among the latter groups of the family we have just quitted, conducts us to *Podiceps*, Latham, that commences the family of *Colymbidæ*, where the same character is strongly developed. The difference between the bills of the types of these two families is softened down by the intervention of that of *Mergus*, which is intermediate between the broad and depressed bill of *Anas* and the narrow and sharp-pointed bill of *Podiceps*. This last genus, in conjunction with *Colymbus*, Linn., from which it differs chiefly in the construction of the foot, composes the family of the *Colymbidæ*. These two well-known groups, differing but little among themselves in external characters, form one of those normal groups of the order where a deficiency is exhibited in the powers of flight by the shortness of their wings, and in the faculty of walking by the backward position of their legs. These deficiencies in the groups before us are compensated for by their capability of remaining for a length of time under water, and by their superior powers of diving. For this latter purpose the structure both of their wings and legs is admirably adapted; the former by their strength assisting them as oars under water, and by their brevity not interfering with their progress; the latter by their compressed and sharpened edge offering no resistance to the water as they are drawn up to effect the stroke which accelerates the movements of the bird. From their superiority in these characters and powers, the birds themselves have obtained *par excellence* the name of *Divers*. In these particulars we may observe them to be united with the *Alcadæ* which succeed them, and from which they are chiefly separated by the presence of the hind toe, conspicuous here, but deficient in the family to which we now proceed.' Mr. Vigors then goes on to the Auks (*Alcadæ*), which he enters by means of the genus *Uria* [GUILLEMOT], originally included in the *Colymbus* of Linnæus, and from which it has been separated chiefly on account of the tri-dactyle conformation of its foot. This character distinguishes the greater part of the *Alcadæ*, a family which, in addition to *Uria* and *Alca*, contains, according to Mr. Vigors, the genus *Aptenodytes* of Linnæus.

M. Lesson, in his Manual, makes the *Colymbidæ* (*Plongeurs ou Brachyptères*, Cuv., *Urinatores*, Vieillot), the first family of the sixth order of birds, *Les Palmipèdes*, *Natatores* of Illiger and Vieillot; and the family comprises the genera *Podiceps*, Lath., *Colymbus* (part), Linn., and *Cephus*, Cuv.

The Prince of Musignano (Charles Lucian Bonaparte) places *Podiceps* under his order Anseres in the family Lobi-

pedes, and *Colymbus* under the same order in his family *Pygopodes*.

In 'Fauna Boreali-Americana,' *Podiceps* is placed at the head of the order *Natatores*, and is immediately succeeded by *Sterna* (the Terns): the position of *Colymbus* is between *Pelecanus* and *Uria*, which last-mentioned genus concludes the order.

COLYMBIDÆ.

Genera. *Podiceps*.

Bill longer than the head, robust, slightly compressed, or nearly cylindrical, subulated, straight, entire, pointed; *upper mandible* straight, or hooked at the point; *nostrils* oblong, half-closed. *Wings* short, the three first *quills* of equal length and longest. *Tail* none. *Toes* bordered with large fimbriations; *hallux* pinnated.

Head and foot of the male Eared Grebe; summer plumage; the head from Mr. Gould's British birds, the foot from a specimen in the Museum of the Zoological Society.

Habits, &c. The Grebes haunt the sea as well as the rivers, are excellent swimmers, and dive frequently, as all who have watched the Dabchick or Little Grebe (*Podiceps minor*), and have been amused by its quickly-repeated plungings well know. They feed on small fishes, frogs, crustaceans, and insects, and their nests, formed of a large quantity of grass, &c., are generally placed among reeds and *carices*, and rise and fall with the water.

Geographical distribution. Very wide. Five European species are enumerated, and the foreign species are very numerous. The form seems capable of adaptation to great varieties of climate. In the 'Tables' published in the 'Introduction to Fauna Boreali-Americana,' we find *Podiceps cornutus* and *Podiceps Carolinensis* among the birds which merely winter in Pennsylvania, and migrate in summer to rear their young in the Fur Countries; and *Podiceps cristatus*, *P. rubricollis*, and *P. cornutus* in the list of species common to the Old World and to the Fur Countries. Mr. Sabine gives a description of a mature individual of *Podiceps rubricollis* killed at Great Slave Lake, and of a specimen of *Podiceps Carolinensis* killed at the same place, both in Sir John Franklin's first expedition, and in May, 1822 and

Dr Richardson notes *Podiceps cristatus* as having been killed on the Saskatchewan, and *Podiceps cornutus* at Great Slave Lake ('Fauna Boreali-Americana'). *Podiceps Chilenis* and *Podiceps Americanus* are natives of the warm parts of America; the first, as its name implies, having been found in the bay of Concepcion, and the second on the Brazilian waters (Rio Grande and S. Paolo); and we select, as an example, *Podiceps occipitalis* of Lesson, from the rivers of the Malouin Islands (Isles Malouines).

Description. This Grebe, according to M. Lesson, is remarkable for the delicate tints of its plumage, which is slate-grey (gris ardoisé) above and of a satiny white below. The cheeks and forehead are of a light grey; a bundle of loose plumes (plumes effilées) springs behind each eye, and is prolonged backwards and on the sides of the neck. A calotte of deep black rises from the occiput, and is prolonged on the posterior part of the neck half way down it. The throat is of a pearly grey, which becomes lighter, so that the front of the neck and the sides are of a pure white, as well as the rest of the lower part of the body. The back and wings are of a deeper slate colour, and this tint, mingled however with white, prevails on the feathers of the rump. The tarsi, toes, and the considerably large membranes which fringe them, are greenish. The bill is short and black. The iris is of a most lively red, so brilliant as to call forth from Père Dom Pernetty, whose *Petit Plongeon à Lunettes* it is, the expression that 'diamonds and rubies have nothing to offer equal to the fire of the eyes of a species of Plongeon which is frequently found on the edge of the sea.' The total length of this Grebe is eleven inches and two or three lines; from the forehead to the point of the bill, eight lines; tarsi, seventeen lines; external toe, two inches.

The form of the bird is so well known from the common Dabchick, that it would have been superfluous to give a figure of an entire Grebe.

Colymbus (Mergus, Brisson — Urinator, Lacépède — and Eudytes, Illiger).

Bill moderate, strong, straight, very much pointed, compressed; **nostrils** concave, half closed. **Wings** short; the first **quill** longest. **Tail** short, rounded. Three front **toes** very long, entirely palmated; **hind toe** bordered with a small supple membrane.

Habits, &c. The Divers bear a close resemblance to the Grebes, from which they differ but little, excepting in their palmated feet. On the water they are at their ease: on land they, as well as the Grebes, are awkward and beset with difficulties in their locomotion.

Geographical distribution. Principally the northern latitudes, where they nestle in the wildest and most desert spots. In the tables in 'Fauna Boreali-Americana,' we find *Colymbus glacialis* and *C. septentrionalis* in the list of species which merely winter in Pennsylvania, and migrate in summer to rear their young in the Fur Countries, and *Colymbus septentrionalis* in the list of birds (migratory) detected on the North Georgian Islands and adjoining seas, lat. 73° to 75° north, on Sir Edward Parry's first voyage. *Colymbus glacialis* and *C. septentrionalis* occur in Captain Sabine's list of Greenland Birds and *Colymbi glacialis, arcticus*, and *septentrionalis*, in Dr. Richardson's list of species common to the Old World and to the Fur Countries.

Example, *Colymbus glacialis*.

Description of a specimen killed on Great Bear Lake.—**Colour.** Head, neck, and upper tail-coverts, glossed with deep purplish-green, on a black ground. A short transverse bar on the throat, a collar on the middle of the neck, interrupted above and below, and the shoulders white, broadly striped on the shafts with black. Whole **upper plumage**, wings, sides of the breast, flanks, and under tail-coverts, black; all, except the quills and tail, marked with a pair of white spots near the tip of each feather: the spots form rows, and are large and quadrangular on the scapulars and interscapulars, round and smaller elsewhere, smallest on the rump. **Under plumage** and inner wing-coverts white, the axillaries striped down their middles with black. **Irides** brown.

Form. **Bill** compressed, strong, tapering; its rictus quite straight; its contour very slightly arched above; lower mandible channelled beneath, appearing deepest in the middle; its gonyes sloping upwards to the point; margins of both mandibles, but particularly of the lower one, indented. **Inner wing-coverts** very long. **Tail**, of twenty feathers, much rounded. Total length thirty-six inches;

extent of wing forty-eight inches. Dr. Richardson, whose description this is, observes, that specimens in mature plumage vary considerably in total length, upwards of an inch in length of wing, and more than half an inch in the length of the tarsus.

Young of the year. Temminck remarks, that these differ considerably from the old birds. The head of the young, the occiput, and the whole posterior part of the neck are of an ashy-brown; on the cheeks are small ashy and white points; throat, front of the neck, and other lower parts pure white; feathers of the back, of the wings, of the rump and flanks, of a very deep brown in the middle, bordered and terminated by bluish ash; upper mandible ashy grey, lower mandible whitish; iris brown; feet externally deep brown, internally, as well as the membranes, whitish. In this state Temminck says that the bird is the *Colymbus Immer*, (Gmel. Syst. Lath. Ind.); *Le Grand Plongeon* of Buffon, (but the plate enl. 914 represents a young individual of *Colymbus Arcticus*); *Mergo Maggiore o Smergo*, (Stor. deg. ucc.) with a good figure. He thinks that the *Imber Taucher* of Bechstein (Naturg. Deut.) is probably a young of this species on account of its large dimensions, and remarks that under the name of *Colymbus Immer* the young of this species are often confounded with those of *Colymbus Arcticus*.

At the age of a year, according to the same author, the individuals of both sexes show a transverse blackish brown band towards the middle of the neck, about an inch in length, forming a kind of collar; the feathers of the back become of a blackish tint, and the small white blotches begin to appear. In this state it is the *Grand Plongeon* of Brisson, (vol. vi., p. 105, pl. 10, f. 1.), a very exact figure.

At the age of two years the collar is more defined; this part, the head and the neck, are varied with brown and greenish-black feathers; the numerous blotches on the back and wings become more prevalent, and the band under the throat, and the nuchal collar also, are marked with longitudinal brown and white lines.

At the age of three years the plumage is perfect.

According to Montagu, *Colymbus glacialis* is the *Colymbus maximus caudatus* of Ray; *Mergus major naevius* and *Mergus naevius* of Brisson; *L'Imbrim* of Buffon; *Greatest speckled Diver* or *Loon* of Willughby; and *Northern Diver* of Pennant, (Br. Zool.); and the *Female** is *Colymbus Immer* of Linnæus; *Colymbus maximus Gessneri* of Ray; *Mergus major* of Brisson; *Le Grand Plongeon* of Buffon; *Ember Goose* of Sibbald; and *Imber Diver* of the British Zoology. It is the *Colymbus torquatus* of Brunnich; and not to weary the reader with more scientific names, it is the *Schwarzhaalsiger Seetaucher*, *Eis-Taucher*, *Grosse Halb-Ente*, and *Meer-Noering* of the Germans; *Brusen* of the Norwegians; *Turlik* of the Greenlanders; *Eithinne-Moqua* of the Cree Indians; *Talkyeh* of the Chipewyans; *Kagloolek* of the Esquimaux; *Inland Loon* of the Hudson's Bay residents; and *Trochydd mawr* of the antient British; it is provincially called by the modern British *Gunner* and *Greater Doucher*.

Habits, &c.—Fish is the principal food of this species, and the herring in particular, the fry of fish, crustaceans and marine vegetables. It *nestles* in small islands, and on the banks of fresh waters, and the female lays two eggs of an Isabella white, marked with very large and with small spots of a purplish ash. Dr. Richardson gives the following description of its manners:—"Though this handsome bird is generally described as an inhabitant of the ocean, we seldom observed it either in the Arctic Sea or Hudson's Bay; but it abounds in all the interior lakes, where it destroys vast quantities of fish. It is rarely seen on land, its limbs being ill fitted for walking, though admirably adapted to its aquatic habits. It can swim with great swiftness, and to a very considerable distance under the water; and when it comes to the surface, it seldom exposes more than the neck. It takes wing with difficulty, flies heavily, though swiftly, and frequently in a circle round those who intrude on its haunts. Its loud and very melancholy cry, like the howling of the wolf, and at times like the distant scream of a man in distress, is said to portend rain. Its flesh is dark, tough, and unpalatable. We caught several of these birds in the fishing nets, in which they had entangled themselves in the pursuit of fish.' The species is sometimes taken even in the south of England. Montagu mentions one which

* But see Temminck's description of the varying plumage according to age above given, &c.

was kept in a pond for some months. In a few days it became extremely docile, would come to the call from one side of the pond to the other, and would take food from the hand. The bird had received an injury in the head, which had deprived one eye of its sight, and the other was a little impaired; but, notwithstanding, it could, by incessantly diving, discover all the fish that were thrown into the pond. When it could not get fish it would eat flesh; and when it quitted the water, it shoved its body along upon the ground like a seal, by jerks, rubbing the breast against the ground; and returned again to the water in a similar manner. In swimming and diving the legs only were used, and not the wings, and by their situation so far behind, and their little deviation from the line of the body, it is enabled to propel itself in the water with great velocity in a straight line, as well as turn with astonishing quickness. In the winter of 1813-14, according to Mr. Graves, during the intense frost, two fine individuals were taken alive in the Thames below Woolwich, and were kept in confinement for some months. They eagerly devoured most kinds of fish or offal. At the approach of spring they began to show great uneasiness in their confinement, though they had the range of an extensive piece of water, from whence they ultimately escaped in the month of April. The distance of the river from the pond in which they were confined was several hundred yards; but they made their escape, and two birds resembling them in colour were seen on the river in that neighbourhood for several days after they were missed, and though repeatedly shot at, they escaped by diving.

Geographical position.—The arctic seas of the New and Old World; very abundant in the Hebrides, Norway, Sweden, and Russia; accidental visitors along the coasts of the ocean. The young in winter are very rare on the lakes of the interior, in Germany, France, and Switzerland: the old birds are never seen there. (Temminck.) It is a rather rare visitant to these islands, especially to the southward.

[*Colymbus glaucialis*.]

Lesson arranges the genus *Cephus* Moehring, Cuvier; *Colymbus*, Linn.; *Uria*, Temm.; *Mergulus*, Ray, Vieillot, under the *Colymbidae*, observing that it forms the passage from the *Divers* to the *Auks*. [Auk, vol. iii., p. 100, subgenus *Mergulus*.]

DIVIDEND, in arithmetic, any quantity which is to be divided (dividendum). Thus in the sentence '100 divided by 20 gives 5,' the dividend is 100.

DIVIDEND, in commerce, is a word having two distinct meanings. In its more general employment it is understood to express the money which is divided, *pro rata*, among the creditors of a bankrupt trader, out of the amount realised from his assets. [BANKRUPT.]

The other meaning attached to the word dividend is not so appropriate as that which has just been explained. It

is used to signify the half-yearly payments of the perpetua and terminable annuities which constitute the public debt of the country, and does not therefore strictly express that which the word is made to imply. The payment of those so called dividends is managed on the part of the government by the bank of England, which receives a compensation from the public for the trouble and expense attending the employment. The exact number of individuals who are entitled to receive these half-yearly payments is not known. The following statement exhibits the number of distinct sums paid by different warrants to various classes of annuitants at the last four periodical payments, but the number of annuitants is not nearly so great as the number of distinct warrants, because many individuals are possessed of annuities due at the same periods of the year, which are included under different heads or accounts in the books of the Bank, as bearing different rates of interest, or being otherwise under different circumstances; and besides, many persons hold annuities which are payable at both half-yearly periods. It is clear, however, from the following figures, that the greater part of the public creditors are entitled to annuities for only small sums, more than nine-tenths of the payments being for sums not exceeding 100*l.*, and nearly one-half for sums not exceeding 10*l.*

DIVING-BELL. [SUBMARINE DESCENT.]

DIVINING ROD, a forked branch, usually, but not always, of hazel, by which it has been pretended that minerals and water may be discovered in the earth, the rod, if slowly carried along in suspension, dipping and pointing downward, it is affirmed, when brought over the spot where the concealed mine or spring is situated. Other mysterious powers, such as that of discovering the lost boundaries of lands, and even of detecting the birth-place and parentage of foundlings, have also been attributed to the divining rod. The rod is sometimes called the *Virgula Divina*, or the *Baculus Divinatorius*, or the rod of Aaron, or the *Caduceus* (after the wand of Mercury). But, although a rod or wand has been the distinguishing ensign of the professors of magic in all ages and countries, and raddology, or divination by the rod, was familiar to the ancient nations, the form, the material, and the mode of using the divining rod of the modern miners and water-finders, seem to be superstitions of comparatively recent introduction. Many persons with some pretensions to science have been believers in the powers ascribed to the divining rod. George Agricola, the able and learned German metallurgist of the sixteenth century, and in later times John Sperlingius and Theodore Kirchmaierus, who have both written *Disputatiuncule* on the rod, all say the devil is in it. Richelet, in his Dictionary (art. *Baguette Divinatoire*), confesses that after what he has seen he cannot entertain any doubt as to its possessing the wonderful qualities ascribed to it. The learned Morhoff, who was eminent for his scientific as well as literary knowledge, admits that it is not clear to him whether the effects be natural or the result of demoniac agency. A. M. Thouvenot published at Paris, in 1781, a Memoir on the relation of the phenomena of the Divining rod to those of Electricity and Magnetism; and our countryman Pryce, in his 'Mineralogia Cornubiensis' (fol., 1778) has collected accounts of numerous successful experiments which he says were performed by the instrument. Some remarks on the rod and on the attempts that have been made to explain its fancied operation may be found in the Marquis le Gendre's 'Traité de l'Opinion,' liv. iii. chap. 6, and liv. iv. chap. 2; and there is a discussion of the subject, which is well worth reading, both for the reflections and some curious facts which it contains, in Bayle's 'Dictionary,' in the notes to the article *Abaris*. See also Morhoff, *Polyhist*, tom. ii. p. 310.)

DIVINITY. [THEOLOGY.]

DIVISIBILITY, DIVISOR. Any number or fraction admits of division by any other, in the extended arithmetical sense which considers *parts* of a time as well as times. Thus 12 contains 8 a time and half a time, or 12 divided by 8 gives $\frac{3}{2}$. The adjective *divisible* is nevertheless applied, not to any number as compared with any other, but only as compared with such numbers as are contained a whole number of times in the first. Thus 12 is said to be divisible by 6, and is said to be not divisible by 8. Or, both in arithmetic and algebra, divisible means 'divisible without introducing fractions into the result.'

The number of divisors which any number admits of is found as follows. Ascertain every prime number which will divide the given number, and how many successive times it will do so. Add one to each of these numbers of times, and multiply the results together. Thus, the number 360 is made by multiplying together 2, 2, 2, 3, 3, 5; or is divisible by 2 three times ($3+1=4$), by 3 twice ($2+1=3$), and by 5 once ($1+1=2$). And $4 \times 3 \times 2 = 24$, the number of divisors which 360 admits of. But among the 24 divisors are included 1 and 360.

DIVISION, the process of ascertaining how many times and parts of times one number is contained in another. The usual arithmetical rule consists in a continual approximation to the result required. We write underneath,—1, the common process; 2, that of which it is an abbreviation; 3, a short summary of the *rationalis*.

| | |
|---------------|--------------|
| 8)23475(2934½ | 8)23475(2000 |
| 16 | 16000 |
| 74 | 7475 |
| 72 | 7200 |
| 27 | 275 |
| 24 | 240 |
| 35 | 35 |
| 32 | 32 |
| 3 | 3 |

The whole contains a number as often as all its parts put together contain that number: and 23 meaning 23,000, and 16 being the highest multiple of 8 below 23, then the 16,000, which is part of 23,000, contains 2000 eights, and it is left to be seen how often the remaining 7000, and the 475 (making 7475) contain 8. The 74 is 7400, and 9 times 8 being 72, the 7200 which is part of 7400, contains 900 eights, and it is left to be seen how often the remaining 200 with the 75 (making 275) contains 8. The 27 is 270, of which the part 240 contains 30 eights, and the remaining 30 together with the 5 (making 35) is left. Of this, 32 contains 4 eights, and the remaining 3 does not contain 8 so much as one time, but the eighth part of 3 units is three times the eighth part of a unit, or $\frac{3}{8}$: whence the answer.

In finding how many times, or parts of times, one fraction is contained in another, the following principle is applied. If two numbers or fractions be multiplied by any number, the number of times, or parts of times, which the first contains the second, is not altered. Thus 7 contains 2 just as 14 contains 4, or as 21 contains 6, &c. If then we take two fractions, such as $\frac{7}{8}$ and $\frac{7}{11}$, it follows that $\frac{7}{8}$ contains $\frac{7}{11}$ just as 77 times $\frac{7}{8}$ contains 77 times $\frac{7}{11}$, or as 33 contains 14: that is, 2 times and $\frac{1}{4}$ of a time. This may easily be shown to give the common rule.

The division of one decimal fraction by another presents a difficulty, slight indeed, but quite sufficient to prevent most persons from becoming expert in the use of tables. The rules given are frequently incomplete, and always such as would render even a practised computer liable to mistake. The question is how to place the decimal point rightly in the result, and this may be best done as follows:—

1. Alter the dividend or divisor by annexing ciphers, until both have the same number of decimal places. This being done—

2. Annex as many ciphers to the dividend, or take away as many from the divisor (or partly one and partly the other) as there are to be decimal places in the result: then divide as in whole numbers, and mark off the given number of decimal places.

Example I. Find out, to three decimal places, how often '076 is contained in 32'1.

First step: '076 and 32'100.

Second step: '076 and 32'100000.

76)3210000(422368—rem. 32.

Answer. 422'368.

Example II. Find out, to 7 decimal places, how often (what fraction of a time) 236'5 is contained in '001.

First step: 236'500 and '001.

Second step: 236'5 and '00100000; namely, *tu* ciphers struck off the divisor and *five* annexed to the dividend (making *seven*).

2365)100000(42—rem. 670

Answer. '0000042.

In making complicated divisions, it is much the shortest plan, and very much the safest, to begin by forming the first nine multiples of the divisor by continued addition (forming the tenth for proof).

DIVORCE (*divórtium*, a *divertendo*, from diverting or separating), the legal separation of husband and wife. Divorce is of two kinds, *à mensâ et thoro*, from bed and board; and *à vinculo matrimonii*, from the bonds of the marriage itself. The divorce *à mensâ et thoro* is pronounced by the spiritual court for causes arising subsequent to the marriage, as for adultery, cruelty, &c.: it does not dissolve the marriage, and the parties cannot contract another marriage. [**BIGAMY.**] In fact it is equivalent only to a separation.

The divorce *à vinculo matrimonii* can be obtained in the spiritual courts for causes only existing before the marriage, as precontract, consanguinity, impotency, &c. This divorce declares the marriage to have been null and void, the issue begotten between the parties are bastardized, and the parties themselves are at liberty to contract marriage with others.

From the curious document preserved by Selden (*Uxor Ebraica*, c. xxx., vol. iii., 845, folio ed. of his works), whereby John de Cameys, in the reign of Ed. I., transferred his wife and her property to William Paynel; and also, from the reference to the laws of Howel the Good, at the end of this article, it would seem that in the early periods of English law a divorce might be had by mutual consent; but all trace of such a custom is lost. We know however (3 Salk. Rep. 138) that, until the 44th Eliz., a divorce *à vinculo matrimonii* might be had in the ecclesiastical courts for adultery; but in *Foljambe's case*, which occurred in that year in the Star Chamber, Archbishop Bancroft, upon the advice of divines, held that adultery was only a cause of divorce *à mensâ et thoro*.

The history of the law of divorce in England may perhaps be thus satisfactorily explained. Marriage being a contract of a civil nature, might originally be dissolved by consent. When, in the progress of civilization, various regulations were prescribed, the ordinary courts of justice asserted their jurisdiction over this as well as every other description of contract. At length, the rite of marriage having been elevated to the dignity of a sacrament by Pope Innocent III., A.D. 1215, the ecclesiastical courts asserted the sole jurisdiction over it. In the course of time the power of these courts was again controlled, and the sole jurisdiction for granting divorces for matter arising subsequently to the marriage, was vested in the superior court of the kingdom, the House of Lords, where it was less likely to be abused than by the ecclesiastical authorities, who, it is notorious, granted these and other dispensations for money.

Marriage is now, by the law of England, indissoluble, for matter arising subsequently, by the decree of any of the ordinary courts, but divorce *à vinculo matrimonii* may still for adultery, &c., be obtained by act of parliament. For this purpose it is necessary that a civil action should have been brought in one of the courts of law against the adulterer [**ADULTERY**], and damages obtained therein, or some sufficient reason adduced why such action was not brought, or damages obtained, and that a definitive sentence of divorce *à mensâ et thoro* should have been pronounced between the parties in the ecclesiastical court; which sentence cannot be obtained for the adultery of the wife, if she recriminates, and can prove that the husband has been unfaithful to the marriage vow; and further, to prevent any collusion between the parties, both houses of parliament may, if necessary, and generally do require satisfactory evidence that it is proper to allow the bill of divorce to pass.

The first proceeding of this nature was in the reign of Edward VI., and bills of divorce have since greatly increased; above seventy such bills have been passed since the commencement of the present century. Where the injured party can satisfy both houses of Parliament, which are not bound in granting or withholding the indulgence by any of

those fixed rules which control the proceedings of ordinary courts of judicature, a divorce is granted. It is a cause of complaint that the expenses of the proceeding are so considerable as to amount to an absolute denial of the relief to the mass of society; indeed from this circumstance divorce bills have not improperly been called the privilege of the rich. There is an order of the House of Lords that, in every divorce bill on account of adultery, a clause shall be inserted prohibiting the marriage of the offending parties with each other; but this clause is generally omitted: indeed it has been inserted but once, and that in a very flagrant case. But it is not unusual for parliament to provide that the wife shall not be left entirely destitute, by directing a payment of a sum of money, in the nature of alimony, by the husband, out of the fortune which he had with the wife. By the divorce *à vinculo matrimonii* the wife forfeits her dower. [DOWER.]

The causes admitted by various codes of laws as grounds for the suspension or dissolution of the contract of marriage, as well as the description of the tribunal which had or in some degree has jurisdiction over the proceedings, are various, and indicative of the degree of civilization of the nations among whom they prevailed.

According to the law of Moses (24 Deut. i.), 'When a man hath taken a wife and married her, and it come to pass that she find no favour in his eyes, because he hath found some uncleanness in her, then let him write her a bill of divorcement and give it in her hand, and send her out of his house.' After 90 days, the wife might marry again. But after she had contracted a second marriage, though she should be again divorced, her former husband might not take her to be his wife. About the time of our Saviour, there was a great dispute between the schools of the great doctors Hillel and Shammai as to the meaning of this law. The former contended that a husband might not divorce his wife but for some gross misconduct, or for some serious bodily defect which was not known to him before marriage; but the latter were of opinion that simple dislike, the smallest offence, or merely the husband's will, was a sufficient ground for divorce. This is the opinion which the Jews generally adopted, and particularly the Pharisees, which explains their conduct when they came to Jesus 'tempting him, and saying unto him, Is it lawful for a man to put away his wife for every cause?' (Matth. xix.) The answer was, 'Moses, because of the hardness of your hearts, suffered you to put away your wives, but from the beginning it was not so.' From this it is evident that Christ considered that the law of Moses allowed too great a latitude to the husband in his exercise of the power of divorce, and that this allowance arose from 'the hardness of their hearts,' by which of course we are to understand that they were so habituated to previous practices, that any law which should have abolished such practices would have been ineffectual. All it could do was to introduce such modifications, with the view of diminishing the existing practices, as the people would tolerate. The form of a Jewish bill of divorcement is given by Selden, *Uxor Ebraica*, lib. iii., ch. 24; and see *Levi's Ceremonies of the Jews*, p. 146.

As the customs of oriental nations do not change, but have continued the same from the earliest periods, we may conclude that the usages in the matter of divorce now existing in Arabia are the same, or nearly so, as when Mohammed endeavoured to reform them among the tribes for which he legislated. An Arab may divorce his wife on the slightest occasion: he has only to say to her 'Thou art divorced,' and she becomes so. So easy and so common is this practice, that Burckhardt assures us that he has seen Arabs not more than 45 years of age who were known to have had 50 wives, yet the Arabs have rarely more than one wife at a time.

By the Mohammedan law a man may divorce his wife orally and without any ceremony; when this is done, he pays her a portion, generally one-third of her dowry. He may divorce her twice, and take her again without her consent; but if he divorce her a third time, or put her away by a triple divorce conveyed in the same sentence, he cannot receive her again until she has been married and divorced by another husband, who must have consummated his marriage with her.

Here then we see that the Jewish lawgiver required a written bill of divorcement to insure due consideration; and he absolutely prohibits the return of the wife after a marriage contracted with another man. The Arabian

legislator required the words 'Thou art divorced' to be repeated three times before the marriage was irrevocably dissolved by the husband. And again, working on the feelings of delicacy inherent in man's nature, after such irrevocable divorce, he required a marriage with another man, actual consummation, and subsequent divorce, before the first husband could take back his wife. Moses, on a somewhat different principle, absolutely prohibited the re-marriage of the parties to the first marriage after a second had been contracted.

By the Jewish law it appears that a wife could not divorce her husband; but under the Mohammedan code, for cruelty and some other causes, she may divorce him; and this is the only instance in which Mohammed appears to have been more considerate towards women than Moses.

(Sale's *Koran*; Lane's *Modern Egyptians*; Hamilton's *Hedaya*, and the *Mishcat ul-Masâib*; Selden's *Uxor Ebraica*; and see the case of *Lindo v. Belisario*, 1 Hag. 216, before Lord Stowell.)

Among the Hindoos, and also among the Chinese, a husband may divorce his wife upon the slightest grounds, or even without assigning any reason. Some of the rules mentioned by the Abbé Dubois, as laid down in the 'Padma Purana,' one of the books of highest authority among the Hindoos, show their manner of thinking concerning the conduct of their wives. 'In every stage of her life, a woman is created to obey. At first she yields obedience to her father and mother; when married, she submits to her husband and her father and mother-in-law; in old age, she must be ruled by her children. During her life she can never be under her own control. If her husband laugh, she ought to laugh; if he weep, she will weep also; if he is disposed to speak, she will join in conversation. When in the presence of her husband, a woman must not look on one side and the other; she must keep her eyes on her master, to be ready to receive his commands. When he speaks, she must be quiet, and listen to nothing besides. When he calls her, she must leave every thing else, and attend upon him alone.' And in the Hindoo code it is said, 'The Creator formed woman for this purpose, viz., that children might be born from her.' The reasons for which, according to the Brahmanic law, a man may divorce his wife, may be seen in Colebrooke's *Digest of Hindoo Law*, vol. ii. p. 414, &c., 8vo. edit.; and Kalthoff, *Jus Matrimonii veterum Indorum* (Bonn, 1829, 8) p. 76, &c.

The laws in the several Grecian states regarding divorce were different, and in some of them men were allowed to put away their wives on slight occasions. The Cretans permitted it to any man who was afraid of having too great a number of children. The Athenians allowed it upon small grounds, but not without giving a bill containing the reasons for the divorce, to be approved (if the party divorced made an appeal) by the chief archon. The Spartans seldom divorced their wives; indeed the ephori fined Lysander for repudiating his wife. Ariston (Herod. vi. 63) put away his second wife, but it seems to have been done rather to have a son, for his wife was barren, than according to the custom of the country. Anaxandrides (Herod. v. 39) was strongly urged by the ephori to divorce his barren wife, and on his not consenting, the matter was compounded by his taking another wife: thus he had two at once, which Herodotus observes was contrary to Spartan usage.

By the laws of the early Romans, the husband alone was permitted to dissolve the marriage, but not without just cause, and a groundless divorce was punished by the forfeiture of the husband's effects, one-half of which went to the wife. Adultery, drunkenness, or counterfeiting the husband's keys, were considered good causes of divorce. For about 500 (Dion. Hal., ii. 25; Gellius, iv. 3; Plutarch, *Vit. Rom. et Num.*, &c.) years after the foundation of the city there was no instance of this right being exercised by the husband; but afterwards divorces became very frequent, not only for sufficient reasons, but on frivolous pretexts, and the same liberty was enjoyed by the women as by the men.

The maxim of the civil law was, that matrimony ought to be free, and either party might renounce the marriage union at pleasure. It was termed *divortium sine causa*, or *sine ulla querela*, i.e., divorce without cause, or without question; and the principle, *bona gratia matrimonium dissolvitur*, matrimony is dissolved at pleasure, is solemnly laid down in the pandects. The abuse of divorce prevailed

in the most polished ages of the Roman republic, though, as has been said, it was unknown in its early history. The Emperor Augustus is said to have endeavoured to restrain this abuse by requiring the observance of certain ceremonies to a valid divorce, according to the manner in which the marriage had been celebrated: thus, if there had been a marriage contract, it was torn in the presence of seven witnesses, the keys were taken from the wife, and a certain form of words was pronounced by the husband or by a freed man; but this check was overpowered by the influence and corruption of manners. Voluntary divorces were abolished by one of the *novels* of Justinian, but they were afterwards revived by another *novel* of the Emperor Justin. In the *novel* restoring the unlimited freedom of divorce the reasons for it are assigned; and while it was admitted that nothing ought to be held so sacred in civil society as marriage, it was declared that the hatred, misery, and crimes, which often flowed from indissoluble connexions, required as a necessary remedy the restoration of the old law by which marriage was dissolved by mutual will and consent. This practice of divorce is understood to have continued in the Byzantine or eastern empire till the ninth or tenth century, and until it was finally subdued by the influence of Christianity.

On a divorce for infidelity, the wife forfeited her dowry; but if the divorce was not made for any fault of hers, her whole dowry was restored, sometimes all at once, but usually by three different payments. In some instances, however, where there was no infidelity on the part of the wife, only part was restored. On the Roman divorce and dowry, see *Dig.* xxiv. tit. 2. 3.

Among the antient Britons, it may be collected from the laws of Howell the Good that the husband and wife might agree to dissolve the marriage at any time; in which case, if the separation took place during the first seven years of the marriage, a certain specified distribution of the property was made, but after that period the division was equal. No limit was set to the husband's discretion in divorcing his wife, but the wife could only divorce her husband in case he should be leprous, have bad breath, or be impotent, in which cases she might leave him and obtain all her property. The parties were at liberty to contract a fresh marriage; but if a man repented of having divorced his wife, although she had married another man, yet if he could overtake her before the consummation of the marriage, or, as the law expresses it, 'with one foot in the bed of her second husband, and the other outside,' he might have his wife again.

Adultery was punishable by fine.

The laws of Scotland relating to divorce differ widely from those existing in England: there, a divorce *d vinculo matrimonii* is a civil remedy, and may be obtained for adultery, or for wilful desertion by either party, persisted in for four years, though to this a good ground of separation is a defence. But recrimination is no bar to a divorce as it is in England.

In the Dutch law there are but two causes of divorce *d vinculo matrimonii*, viz., adultery and desertion.

In Spain the same causes affect the validity of a marriage as in England, and the contract is indissoluble by the civil courts, matrimonial causes being exclusively of ecclesiastical cognizance. (*Instit. Laws of Spain*.)

The law of France, before the Revolution, following the judgment of the Catholic Church, held marriage to be indissoluble; but the legislators of the early revolutionary period permitted divorce at the pleasure of the parties, where incompatibility of temper was alleged. In the first three months of the year 1793, the number of divorces in the city of Paris alone amounted to 562, the marriages to 1785, a proportion not much less than one to three; while the divorces in England for the previous century did not amount to much more than one-fifth of the number. (*Burke's Letters on a Regicide Peace*.) Burke further states that he followed up the inquiry through several subsequent months till he was tired, and found the results still the same. It must be remembered however that Burke wrote in the spirit of an advocate; that the period he chose was that immediately following the promulgation of the law, when all couples previously discontented with each other obtained divorces; and that if his calculations had fully borne out his statement, he would have given them in his pamphlet, which was written for a political purpose, and he would not have rested satisfied with indefinite allegations. It was generally admitted however that the license

P. C., No. 536.

was too great. The Code Napoleon accordingly restricted the liberty, but still allowed either party to demand a divorce on the ground of adultery committed by the other; for outrageous conduct, or ill usage; on account of condemnation to an infamous punishment; or to effect it by mutual consent, expressed under certain conditions. By the same code a woman could not contract a new marriage until the expiration of ten months from the dissolution of the preceding.

On the restoration of the Bourbons a law was promulgated (8th May, 1816), declaring divorce to be abolished; that all suits then pending for divorce, for definite cause, should be for separation only, and that all steps then taken for divorce by mutual consent should be void; and such is now the law of France.

It must be borne in mind, however, that the Roman Church, for the purpose of increasing its revenue, has at all times claimed the right to dissolve marriage by dispensation; and therefore this power of divorce still exists in France, and all Roman Catholic countries, independent of the law of the land. It has since been decided by the Cour de Cassation that the conjugal infidelity of the husband is a bar to a suit instituted by him for divorce on the ground of the wife's adultery. (*McKenna's Notes on the Code Civil*.)

In the United States, marriage, though it may be celebrated before clergymen as well as civil magistrates, is considered as a civil contract. The causes of divorce, and the facility or difficulty of obtaining it, are by no means the same in the several states. The more general causes of a divorce *d vinculo matrimonii* are, former marriage, physical incapacity, or consanguinity; by the Connecticut law, fraudulent contract; and by the New York code, idiocy and insanity, and either party being under the age of consent. Adultery is also a cause of divorce *d vinculo matrimonii*; and the laws of some of the states prohibit the guilty party from marrying again. If the husband or wife is absent seven years, or, by the laws of some States, three years, and not heard from, the other is at liberty to marry again; and in some states, if the husband desert the wife, and make no provision for her support during three years, being able to make such provision, the wife can obtain a divorce. Extreme cruelty in either party is also generally a cause of divorce *d vinculo matrimonii*. In many of the states applications to the legislature for divorce, in cases not provided for by the statutes, are very frequent. In New York and New Jersey, divorce is a subject of Chancery jurisdiction, from which, as in other cases, questions of law may be referred to a jury for trial. In New Hampshire, joining the religious society of Shakers, who hold cohabitation unlawful, and continuing in that society for three years, is sufficient cause for a divorce. But in most of the States the courts of law have cognizance of divorce. The laws prescribe the provision to be made for the wife in case of divorce, confiding to the courts however some degree of discretion in fixing the amount of alimony.

It is very questionable, says Chancellor Kent, whether the facility with which divorces can be procured in some of the States be not productive of more evil than good: and he states that he has had reason to believe, in the exercise of a judicial cognizance over numerous cases of divorce, that adultery was sometimes committed on the part of the husband for the very purpose of the divorce.

(*Kent's Comm.*; *Ency. Americ.* Upon the general advantages of indissolubility, as opposed to an unlimited right of divorce, see Hume's *Essay on Polygamy and Divorce*; Paley's *Moral Philosophy*; and the judgment of Lord Stowell in *Evans v. Evans*, 1 Hagg. Repl., 48; Milton, in his famous treatise, advocates the increased facility of obtaining a divorce; and see Gibbon, *Decl. and Fall*, c. 44.)

DIWÂN is a Persian word familiar to readers of works relating to the East, in the sense of—1st. a senate, or council of state; and, 2nd., a collection of poems by one and the same author. The earliest acceptation, however, in which we find it employed is that of a muster-roll, or military pay-book. The Arabic historian, Fakhreddin Râzi, informs us that when, in the caliphate of Omar, the second successor of Mohammed, the conquests of the Mussulmans assumed an extensive character, the equal distribution of the booty became a matter of great difficulty. A Persian marzbân, or satrap, who happened to be at the head-quarters of the caliph at Medinah, suggested the adoption of the system

Vol. IX.—G

followed in his own country, of an account-book, in which all receipts and disbursements were regularly entered, along with a list duly arranged, of the names of those persons who were entitled to a share in the booty. With the register itself, its Persian appellation (*diwān*) was adopted by the Arabs. (Freytag, *Locumani Fabulas et plura loca ex codd. historicis selecta*, &c., pp. 32, 33; Hensl, *Fragmenta Arabica*, St. Petersburg, 1828, p. 36, et seq.) Whether a council of state was subsequently called *diwān*, as having originally been a financial board appointed to regulate the list (*diwān*) of stipendiaries and pensioners, or whether it was so called as being summoned according to a list (*diwān*) containing the names of all its members, we are unable to determine. The opinion that a body of councillors should have received this appellation, as has been asserted by some, in consequence of the expression of an ancient king of Persia, *frān diwān end*, 'these (men) are (clever like) devils,' will scarcely be seriously entertained by any one. The word '*diwān*' is also used to express the saloon or hall where a council is held, and has been applied to denote generally a state chamber, or room where company is received. Hence probably it has arisen that the word '*divan*,' in several European languages, signifies a sofa. Collections of poems in Persian, Arabic, Turkish, Hindustani, &c., seem to have received the appellation '*diwān*' from their methodical arrangement, inasmuch as the poems succeed one another according to the alphabetic order of the concluding letters of the rhyming syllables, which are the same in all the disticha throughout each poem.

DIXMUIDEN. [FLANDERS, WEST.]

DIZIER, ST., a town in France, in the department of Haute Marne, on the right north bank of the Marne, and on the road from Paris by Meaux and Châlons to Bar le Duc, Nancy, and Strasburg. It is 118 miles east by south of Paris in a straight line, or 138 miles by the road; in 48° 38' N. lat., and 4° 56' E. long.

In 1544 St. Dizier made a vigorous resistance against the Emperor Charles V., who had invaded France, but was obliged to surrender: it was restored at the subsequent peace. In later times its fortifications have been neglected. Two engagements were fought near St. Dizier, in 1814, between the French and the allies who had invaded France.

The town is agreeably situated, and is well built; it is surrounded with public walks: the houses were formerly of wood, but after a great fire which happened about sixty years ago they were mostly rebuilt of stone. The town-hall is a handsome building of modern erection; in front of it is a covered market.

The population, in 1832, was 5957 for the town, or 6197 for the whole commune. The inhabitants carry on a considerable trade in wood and iron: the forests round the town furnish excellent timber for ship-building. The navigation of the Marne commences here. Oil-cloth and some iron goods are manufactured, and formerly (if not at present) hosiery, hats, linen and hempen cloths, and casks. Stone is quarried near the town; and there is coal, but we are not aware whether it is worked.

DMITRIEV, IVAN IVANOVITCH, was born in 1760, in the government of Simbirsk, where his father, who was himself a man of superior information, possessed an estate. After being educated at Kazan until his twelfth year, he was pursuing his studies at Simbirsk, when that part of the empire was thrown into an unsettled state by Pugachev's rebellion, in consequence of which his family determined to leave it, and he was sent to St. Petersburg, where he was entered in the Semenovsky regiment of guards, and within a short time put on active service, in which he continued until the reign of the emperor Paul, when an appointment in the civil service was bestowed upon him. After the accession of Alexander he was made successively minister of justice and privy councillor, and finally retired from public life with a pension and the order of St. Vladimir of the first class. Although a life passed in such occupations was little favourable to literary pursuits, particularly the earlier part of it, a strong natural attachment to them led him to devote himself to them as sedulously as circumstances would permit, and with such success, that, after Karamzin, he was, among contemporary writers, the one who most contributed to polish the Russian language, imparting to it ease and gracefulness of style and elegance of diction. His poems, which have passed through many editions, and are deservedly popular, consist principally of

odes, epistles, satires, tales, and fables, in which last-mentioned species of composition—a very favourite one with his countrymen—he particularly excelled; and if we except Krilov, he occupies the first rank among the Russian fabulists. By some he has been styled the Lafontaine of Russia, as well on account of the refined tone of his subjects as the studied simplicity of his language. In his poetical tales he stands almost alone—certainly unrivalled—among his countrymen, not less for the playfulness and shrewdness of his satire than for the peculiar happiness and finish of his style. His odes likewise possess considerable merit; but as a lyric poet he falls short of Lomonosov, Derzhavin, and Petrov.

DNIEPER, DNYEPR, or DNEPR, also called the *Ouri* by the Tartars, one of the largest rivers of European Russia, and, next to the Danube, the most considerable of the streams that discharge themselves into the Black Sea. It rises in the circle of Viasma, in the northern part of the government of Smolensk, near the sources of the Dwina and Volga, and among the swamps of the Alansk or Alauian hills on the southern declivity of the Volkonsky forest. It flows generally in a south-south-west direction till it approaches the town of Smolensk, where it inclines more to the west, and makes its way to Orsza, whence it has a southerly course through the government of Mohileff, which it divides in part from that of Minsk. In this part of its course it is increased by numerous tributary streams; among others the Dnietz, Soesja, Berezina, which last is united to the Dwina by means of a canal, Merya, and Gryaza. After forming the boundary between parts of the governments of Minsk and Tshernigoff, it enters that of Kieff, where it immediately receives the Prupiez, which the Muchavies and Orginski canals connect with the Vistula and Niemen, and before it reaches Kieff, the Desna Usha, Osler, and other rivers. Continuing its course south-eastwards, the Dnieper, below Kieff, forms the western and south-western limit of the government of Pultava, and next passing between the governments of Ekaterinoslaf and Cherson, it bends again to the south-west; its waters south of Kieff having been increased by the Rope, Bazafionk, Pajol, Vorskia, Orel, Samara, and other streams. It then flows between the governments of Duchoborzen (the Nogay Steppes) and Cherson, and at length forms, in conjunction with the Bog, a large liman, or swampy lake, nearly fifty miles long, and from one to six broad, by which it discharges itself into the Black Sea. This liman extends from Cherson to Oczakoff.

The entire length of the Dnieper with its windings is about 1000 miles: in a straight line it is about 650 from its source to its mouth. Its upper basin comprises nearly fourteen degrees of longitude; from 24° to about 37½° east. Its average width is estimated at 700 paces, and the surface which this river and its tributaries drain is exceeded only among European streams by that of the Danube. The Dnieper flows for the most part between high banks, the greatest elevation of which is along the eastern side. The upper part of its course is through a marshy country, and in the middle and lower course it passes over many rocks. It is broader, deeper, and more rapid than the Don, and is navigable from Smolensk to Kieff; but below the latter town, near Kidack, the navigation is interrupted for about forty miles by thirteen cataracts called Poroge, as well as by enormous blocks of stone; this space is passable for vessels of small draught during the spring months only, for which reason all merchandise intended for Cherson or the Black Sea is unladen at Old Samara, whence it is conveyed by land to Alexandrofsk, at the mouth of the Mocofska, a distance of about forty-six miles by land. From this spot to the mouth of the Dnieper, a distance of about 260 miles, the navigation is unimpeded. Below the cataracts, and as far as the liman of this river, upwards of seventy islands occur; in fact the Dnieper in this interval has no open water for seven miles together. Kaiskaya and Jedosa-Ostroma, the largest of these islands, became a place of refuge to the Zaporogue-Cossacks, who established their Setcha, or head camp upon them. The islands produce a grape called Birioussa, which resembles the currants of Corinth. They are full of serpents, and abound in a sort of wild cat, which hunts the shrew-mouse.

As the Dnieper flows through more than nine degrees of latitude (from near 56° to 46½° N. lat.), there is great diversity of climate in various parts of its basin: at Smolensk the waters freeze in November, and continue

ice-bound until April; at Kieff they are frozen from January to March only. The river abounds in fish, particularly the sturgeon, carp, pike, and shad. There are bridges across it at Smolensk and Kieff the latter, which is 1638 paces in length, and constructed with rafts, is removed about the end of October and replaced in the spring, as it would otherwise be destroyed on the breaking up of the ice. This river is the Borysthenes of the Greeks and Danapris of the middle ages. It is first mentioned by Herodotus (iv. 53), who, though professing his ignorance of its source, has shown very clearly that he was well acquainted with the river. He says that it was known for forty days' sail upwards, but no farther: the large fish which he mentions as used for salting is probably the sturgeon. With the exception of the more southerly parts, its banks have long been inhabited by races of Slavonian origin. Towards the mouth, from the Ross on the right, and the Voraka and Soula on the left bank, the country was for a long time nothing better than a steppe, where the nomadic tribes of the Petchenegs and afterwards of the Poloftis fed their numerous flocks.

Since the last peace with Turkey and the partition of Poland, both banks of the Dnieper are become the property of Russia. The principal towns on its banks are Smolensk, Mohileff, Kieff, Ekaterinoslaf, and Cherson.

DNIESTER, DNYSTER, or DNESTR, one of the principal rivers of European Russia, has its source in a small lake on the Miedoborzec, one of the north-eastern declivities of the Carpathian mountains lying in the circle of Sambor, in the Austrian kingdom of Galicia, and in about 49° N. lat. Within this kingdom the Dniester receives the Tismania, Stry, Swica, Lomnica, and Bistritza, on its southern, and the Lipa, Stripa, and Sered, on its northern bank. After passing the town of Sambor, it pursues a south-easterly course to Halicz, Mariampol, and Zaleszczyki. Thence it runs in an E.S.E. direction to Chotym, at the north-western extremity of Bessarabia, where, leaving the Austrian, it enters the Russian territory. At Chotym it receives the Podhorze, which separates Galicia from the government of Podolia, and thence flows north-east, with numerous windings, to Kameniec, the capital of that government. After passing Kameniec, it has no tributaries of any great importance; the chief are the Smoritzza, Yaurlik, Kurtshugan, Rent, and Botna. From Kameniec it runs eastwards to Ushitzza, and soon afterwards flows again south-easterly; forming in its descent to the Black Sea the boundary line first between Bessarabia and Podolia, and afterwards between the governments of Bessarabia and Cherson. From Ushitzza it passes the towns of Mohileff, Yampol, Dubossari, Kishenoff, the once important fortress of Bender, and Tiraspol, which is on the opposite bank. It enters the Black Sea by a broad liman, about nineteen miles in length and five in breadth, but not more than seven feet in depth, the mouth of which lies between Akerman and Ovidiopoli. In front of the mouth is a long neck of low sand, which the sea, by forcing a passage at several points, has formed into islets.

The current of the Dniester is exceedingly rapid. The navigation commences at Halicz, but is interrupted at Porohy, two miles below Yampol, by two considerable falls and several whirlpools; and it does not become free again until it reaches Bender. As far as Old Sambor it flows through a deep broad valley, which afterwards expands on its eastern bank into an extensive plain; while on its right bank it is occasionally skirted by offsets from the Carpathian chain, varying from 180 to 250 feet in height. These elevations accompany its course as low down as Chotym, from which point it flows through an open flat country. The bed is muddy, and its waters, which are turbid and of a yellowish hue, and often broken by masses of rock, are frequently covered with foam; they rise and fall several times in the course of the day. The direct distance between the source of the Dniester and its mouth is estimated at about 420 miles, but, including its windings, its whole length is not less than 510 miles. Its average breadth is said to be 172 paces.

Before the left bank was in the possession of Russia the navigation of the Dniester was rendered very insecure by the predatory habits of the Turks and Tartars, but it is now become a safe means of transporting wood, grain, and merchandise from the Russian provinces to Odessa. The principal places at which vessels load and unload are Stria and Seletchi on the Austrian, and Zranetz and Dubossari on the

Russian side. The Dniester abounds in fish, particularly the sturgeon.

The Dniester was known to Herodotus (iv. 51), Ovid (Pont. iv. 10, verse 50), and the later Greeks by the name of the Tyras; and it was subsequently called Danastria.

DO, in music, the name given by the Italians and the English to the first of the syllables used in solmization, and answering to the *ut* of the French.

DOAB. A word signifying *two waters*, which is used in Hindustan to denote any tract of land included between two rivers. There are several Doabs in Hindustan, but the district to which the name is most generally applied is situated between the Ganges and the Jumna. This district has its eastern extremity at Allahabad, whence it proceeds in a north-west direction to the hilly country in northern Hindustan, the northern frontier of the district of Saharunpore in the province of Delhi forming its north-western boundary. The length of this tract is more than 500 miles, and its mean breadth about 55 miles; it comprehends the districts of Saharunpore, Merut, Alighur, Furruckabad, Kanoje, Etawah, Korna, Currah, and Allahabad. The prevailing character of the Doab is flatness and nakedness. A few clusters of trees are occasionally seen near the more considerable villages, but in other places many miles may be passed over without meeting with a tree. The only fuel consists of a low shrubby plant called palass, which is very inferior in quality. The principal productions are millet and barley, sugar, cotton, tobacco, and indigo. The straw of the millet is very serviceable as provender for cattle. One of the chief branches of industry, especially in the northern parts of the Doab, is the manufacture of coarse cotton cloths: the indigo produced is inferior in quality to that of Bengal. The temperature of the air in this part of India is liable to sudden and violent alternations; the range of the thermometer between the morning and afternoon is frequently 30, and sometimes as much as 40 degrees. In April and May, when the hot winds prevail, the thermometer often rises higher than 120 degrees in the shade, and at other seasons the temperature at daybreak is sometimes below the freezing point.

The southern part of the Doab came into the possession of the English in 1801, when it was acquired from the king of Oude. In 1803 the more northern part was ceded to the English by Dowlut Rao Scindia. The population is of a very mixed character, and consists of Jhats, Rajpoots, Patans, Thugs, and various other tribes, who, previous to the acquisition of the country by the English, had been much addicted to plunder, and dacoity or gang robbery was of frequent occurrence: this has since been greatly remedied. Three other districts to which the name of Doab is applied are situated in the province of Lahore. One of these, the Doab or Doabeh Barry, is included between the Ravey and Beyah rivers, and contains the cities of Lahore and Amritsir; the second, the Doabeh Jallinder, is included between the Beyah and the Sutleje, and forms the most fertile portion of the Seik territory; the third, the Doabeh Rechna, comprehends the tract between the Ravey and the Chinaub; the principal towns contained in it are Bissolce, Emenabad, and Vizierabad.

DOBOKA (or Doboka-Varmegye), a large county of Transylvania, situated in the north-western part of that principality, and containing an area of about 1138 square miles. The eastern as well as the western parts are very mountainous, and the highest elevations are from 1800 to 2000 feet: the central districts are level, and form a continuation of the great Clausenburg Heide or heath, called by the natives the Mezoesege. Doboka is traversed by the Little Szamos or Samosch, the Bisztritz, and Schayo. The climate in the higher regions is fresh and salubrious, but heavy and less healthy in the lower. The soil, though sandy and stony, is not unproductive: agriculture is confined chiefly to the midland districts. In the uplands there are excellent pastures, and the mountains are covered with forests, from which much timber is obtained. Some wine is produced, and the stock of horses, horned cattle, sheep, goats, and swine, is considerable. Honey and wax are made in large quantities. In 1778 this county contained 13,478 families, and 45,891 inhabitants; the present population is estimated at about 87,000. There are gold and silver mines, but they are not worked, nor is any advantage taken of the resources Doboka possesses in salt. There are 163 villages and 1 town in the county; the latter is called Szék, or Seeken, a privileged town with a municipality, and the seat of the Tabula Continua, or administrative board of Doboka.

It lies about twelve miles to the north-east of Clausenburg. The inhabitants derive their subsistence from their corn-lands and vineyards, but the extensive salt mines in its vicinity are no longer turned to account. Doboka, a Wallachian village to the west of Szék, which gives its name to the whole county, is encircled by mountains. Another spot of much note among the Transylvanians is Apafalva, the original seat of the Apasian princes, who governed all Transylvania from 1661 to 1713.

DOBREE, PETER PAUL, was born in the island of Guernsey in the year 1782. At an early age he was sent to Dr. Valpy's school at Reading, and stayed there till he became an undergraduate of Trinity College in the year 1800. He took his B.A. degree in 1804. He was a candidate for the chancellor's medals, but did not obtain either, having been, it is said, prevented by ill health from doing himself justice in the examination. After being elected a fellow of his college, he continued to reside at Cambridge, devoting himself to classical studies, and enjoying the intimacy of Porson, to whom he was devotedly attached, and from whom he derived all the spirit of his scholarship. After Porson's death, the books and MSS. of that great critic were purchased by Trinity College, and the task of editing part of Porson's notes was intrusted to Dobree: he was prevented, however, by illness, a subsequent journey to Spain, and other causes, from publishing the portion of these remains assigned to him till 1820, when he brought out an edition of the *Plutus* and of all that Porson had left upon *Aristophanes*, along with some learned notes of his own. In 1822 he published Porson's transcript of the lexicon of *Photius*. In the following year he was elected Regius professor of Greek. He died on the 24th September, 1825. He was engaged on an edition of *Demosthenes* at the time of his death: his notes on this and other Greek and Latin authors were collected and published by his successor in 1831. Some of his remarks are very acute, and some of his conjectures most ingenious, but it may be doubted if his friends have consulted his reputation in publishing a number of crude observations, the greater part of which were certainly never intended for the press. As a scholar, Dobree was accurate and fastidious: he had some taste, and much common sense, which preserved him from committing blunders. His unwearied industry supplied him with a vast induction of particular observations; but he was unwilling, perhaps unable, to generalise; and on the whole, it must be allowed that he has neither done nor shown a power of doing any thing to justify the extravagant encomiums of some of his friends.

DOCK, the common name of many perennial tap-rooted species of the genus *Rumex*. They do not multiply by division of the root, but their seeds are dispersed in such abundance that they become a serious nuisance in cultivated land if they are not extirpated. The only two methods of doing this, are either by tearing or digging them up, which is so slow as scarcely to be adopted in practical husbandry, or by constantly hoeing up their young shoots; by the latter means they usually may be destroyed in a single summer.

DOCK, a place artificially formed for the reception of ships, the entrance of which is generally closed by gates. There are two kinds of docks, dry-docks and wet-docks. The former are used for receiving ships in order to their being inspected and repaired. For this purpose the dock must be so contrived that the water may be admitted or excluded at pleasure, so that a vessel can be floated in when the tide is high, and that the water may run out with the fall of the tide, or be pumped out, the closing of the gates preventing its return. Wet-docks are formed for the purpose of keeping vessels always afloat. The name of dock has sometimes been applied to an excavation from which the water, or a considerable part of it, runs in and out with the tide; but such an excavation is more properly an artificial basin or harbour than a dock. One of the chief uses of a dock is to keep a uniform level of water, so that the business of loading and unloading ships can be carried on without any interruption. Dock-yards belonging to the government usually consist of dry-docks for repairing ships, and of slips on which new vessels are built; besides which they comprize storehouses, in which various kinds of naval stores are kept, and workshops in which different processes subsidiary to ship-building are carried on. For some account of the great Dock-yards of this kingdom the articles CHATHAM, DEVONPORT, PORTSMOUTH, and PLYMOUTH may be referred to.

The first wet-dock for commercial purposes made in this kingdom was formed in the year 1708 at Liverpool, then a place of no importance. It has been usual to ascribe to the amount of accommodation for shipping which has since been provided at this port a great part of the prosperity which it exhibits at the present day. That the docks at Liverpool have been and are of immense importance to the trade of the town, and extremely profitable to the corporation to which they belong, cannot be disputed, and that the progress of the trade of Liverpool has been accelerated by their means is highly probable; but that progress seems necessarily to have followed from the extraordinary growth of the manufactures in Lancashire; and as Liverpool is the natural outlet for the export trade of that part of the kingdom, we may suppose that the improvements in question have arisen out of the demands and necessities of commerce rather than that they have been the cause in any considerable degree of the trade itself. The Liverpool docks have been exceedingly profitable in proportion to the money expended on their construction. This expense has been much less than such works in general require, the labour of excavating having been in a great measure saved in consequence of their area having been inclosed from the river. For the same reason, the corporation of the town, to whom the docks belong, never had to make any outlay for the purchase of the land; and another great cause of expenditure which has occurred at other places has been avoided at Liverpool, where the docks are simply such, and are not provided with warehouses for storing goods. The dock first constructed, and which went by the name of "The Old Dock," was filled up a few years ago, and the site is now occupied by a very handsome custom-house, which is on the point of being completed (May 1837). Since the Old Dock was first made others have been added at different periods, and at present the margin of the Mersey along the whole extent of the town is occupied by a series of eleven docks, without reckoning one constructed by the late Duke of Bridgewater as an auxiliary to his operations in internal navigation: this work, which is called "*The Duke's Dock*," is now in possession of the Duke of Bridgewater's executors. The aggregate area of those docks which are the property of the corporation exceeds 100 acres.

The great advantage which the trade of Liverpool has progressively gained from the existence of these docks may be gathered from the following statement of the number of vessels by which they have been frequented in different years, taken at intervals, and by the amount of dues collected upon these vessels and the goods loaded and unloaded in and from the same.

| Years. | Vessels. | Amount of Dock Dues. | Years. | Vessels. | Amount of Dock Dues. |
|----------|-----------|----------------------|----------|------------|----------------------|
| 1757.... | 1,371.... | £2,336 | 1800.... | 4,746.... | £23,379 |
| 1760.... | 1,245.... | 2,330 | 1805.... | 4,618.... | 33,364 |
| 1765.... | 1,930.... | 3,455 | 1810.... | 6,729.... | 65,782 |
| 1770.... | 2,073.... | 1,142 | 1815.... | 6,440.... | 76,915 |
| 1775.... | 2,291.... | 5,384 | 1820.... | 7,276.... | 94,412 |
| 1780.... | 2,261.... | 3,528 | 1825.... | 10,837.... | 128,691 |

| 1790.... | 4,223.... | 10,037 | 1835.... | 14,959.... | 244,814 |
| 1795.... | 3,948.... | 9,368 | | | |

An act of Parliament was passed in 1825 vesting the management of the Docks in a committee of '21 members, of whom 13 are nominated by the corporation of Liverpool, and 8 are elected out of their own body by the merchants who pay each at least 10*l.* a year in rates.

The first commercial wet-dock constructed in the port of London was for the accommodation of vessels employed in the Greenland whale-fishery, and was provided with the necessary apparatus for boiling the blubber. This branch of trade having almost entirely left the port of London, the dock was, about 30 years ago, opened for the reception of vessels employed in the European timber and corn trades; and with a view to the latter, a range of granaries was built. This dock, which is now known as the 'Commercial Dock,' is situated at Rotherhithe; it occupies altogether 49 acres, about four-fifths of which are water. The warehouses are not built so as to entitle them to be considered 'places of special security,' as described in the warehousing act, and many descriptions of goods are consequently not permitted to be deposited in them under bond.

Up to the end of the last century all ships arriving in London, with the exception already mentioned of the Greenland whale-ships, discharged their cargoes into lighters in

the river. The continually increasing inconvenience thus caused by the growing trade of the port was much aggravated during a time of war, by the circumstance of the West India ships arriving together in great numbers under convoy. To remedy this inconvenience, a plan was projected in 1793 for constructing wet-docks for the reception of ships employed in the West India trade; but it was not until 1799 that the scheme was sanctioned by Parliament, and that an act was passed incorporating a company for the purpose, with a capital or joint-stock of 1,380,000*l*. The docks constructed under this act of incorporation are known as the West India Docks, and extend across the piece of land called the Isle of Dogs, which lies in a bend of the Thames between Blackwall and Limehouse, at both of which places there are entrances to the docks. Their construction was begun in February 1800, and was prosecuted so vigorously that in two years and a half from that time the works were sufficiently advanced to admit vessels for unloading. These docks consisted at first of two separate basins, one of which was used for discharging, and the other for loading ships. The import dock, which is situated to the north, is 870 yards long and 166 yards wide; the export dock is of the same length and 135 yards wide, so that the area of the two is equal to 54 acres; there are besides two basins, one at each entrance, that at Blackwall being 5 acres, and that at Limehouse 2 acres in extent. These two docks are together capable of accommodating more than 500 sail of merchant vessels of large size, and during the war, when ships arrived from the Colonies in large fleets, the accommodation was at times found to be not greater than was required. The import dock is surrounded by ranges of commodious warehouses. The city canal, which was cut parallel with the West India Docks on the south, was intended to form a short cut for ships, to enable them to avoid the circuit of the Isle of Dogs, but being very little used, was purchased about four years ago by the West India Dock Company, and a communication was made between it and the other basins.

The London Docks, which are situated at Wapping, were begun in the year 1801, and opened for business in 1805; they consist of the western dock of 20 acres, the eastern dock of 7 acres, and the tobacco dock, between the other two, of more than one acre. The space included within the dock walls exceeds 71 acres. The warehouses are spacious, and very substantially built. The tobacco warehouse, which is on the south side of the tobacco-dock, covers nearly five acres. The vaults beneath the warehouses contain space enough for stowing 66,000 pipes and puncheons of wine and spirits. One of the vaults has an area of 7 acres. A great part of the expense attending upon the construction of these docks was owing to the value of the houses and other property by which the site was previously occupied, and by the compensation which the Dock Company was bound by its act of incorporation to pay to lightermen, owners of warehouses in the City of London, and others whose business would probably suffer from the establishing of the docks. The joint-stock of the company is 3,238,000*l*., in addition to which 700,000*l*. have been borrowed and expended. The amount of business carried on has been very great from the first opening of these docks, but the proprietors do not receive more than 2½ per cent. per annum on their stock.

The East India Docks, intended for the reception of ships employed by the East India Company, are situated at Blackwall, below the entrance to the West India Docks. There are two docks, one for unloading, the other for loading ships, of the area of 18 and 9 acres respectively; the entrance basin, which is common to both docks, is about 3 acres in extent: the cost of this undertaking was about 500,000*l*.: it has not hitherto proved profitable to the undertakers.

The East Country Dock adjoins the Commercial Dock to the south. It is frequented by vessels employed in the European timber trade. This dock, which was constructed in 1807, has an area of about 6½ acres. The basin at the entrance of the Surrey canal at Rotherhithe is also used as a dock.

The projecting of the St. Katherine's Docks arose out of an alleged want of sufficient accommodation in the London Docks. The act incorporating the St. Katherine's Dock Company was passed in 1826, and the Docks, which are situated between the London Docks and the Tower, were partially opened for business in October 1828. The joint-stock of the company amounts to 1,352,000*l*., besides which 800,000*l*. of borrowed money have been spent. The outer wall incloses an area of 24 acres, of which 11 acres are

water, the remainder being occupied by quays and warehouses. There are two docks, each capable of receiving vessels of 800 tons burthen, and which are frequented by ships in the East India, the North American and South American trades. The warehouses are very commodious, and so contrived that goods are taken into them at once from the ship.

The wet-dock at Bristol, which is of a character different from those of Liverpool and London, has already been described. [BRISTOL.]

At Hull there are three docks, occupying together an area of 26 acres, and capable of affording accommodation to more than 300 ships; but this amount is found to be insufficient for the increasing trade of the port, and a public meeting was lately held in the town to consider of the steps necessary to be taken for providing more dock room. The new port of Goole, situated near the junction of the Ouse with the Humber has two wet-docks, one of which is calculated for the reception of sea-going vessels of considerable burthen, and the other is used for the accommodation of small craft which navigate the rivers and canals.

Leith has two wet-docks, extending together over 10 acres, and capable of accommodating 150 vessels of the size which at the time of the works being performed usually frequented the port. Since then, the introduction of steam navigation has made an entire change in the wants and uses of Leith as a harbour. The entrance to the docks is not sufficiently wide to admit the large steam vessels trading between London and Edinburgh, which must consequently discharge and load in the harbour, where they take the ground every tide, which is very objectionable, or they must lie at anchor in the Frith of Forth, and load and unload by means of boats, which is expensive and sometimes difficult, and even dangerous. The deficient state of accommodation here described was investigated by a committee of the House of Commons in 1835, but the insolvent condition of the corporation of Edinburgh, in which body is vested the property of the harbour and shore of Leith and its neighbourhood, has hitherto prevented the commencement of any improvement.

DOCLEA. [MAIADRE.]

DOCTOR, one that has taken the highest degree in the faculties of Divinity, Law, Physic, or Music. In its original import it means a person so skilled in his particular art or science as to be qualified to teach it.

There is much difference of opinion as to the time when the title of Doctor was first created. It seems to have been established for the professors of the Roman law in the University of Bologna, about the middle of the twelfth century. Antony à Wood says, that the title of Doctor in Divinity began at Paris, after Peter Lombard had compiled his Sentences, about the year 1151. (*Hist. and Antiq. Univ. of Oxford*, 4to. Oxf. 1792, vol. i. p. 62.) Previously, those who had proceeded in the faculties had been termed Masters only. The title of Doctor was not adopted in the English Universities earlier than the time of John or Henry the Third.

Wood cites several instances of the expense and magnificence which attended the early granting of the higher degrees in England in the reigns of Henry III. and Edward I. About the year 1268, he says, when Alphonsus de Senia, or Siena, an Italian, studied at Oxford, one Bonifacius de Saluciis proceeded in the civil law, at whose inception there were such ceremonies and feasting, that the like for that faculty was scarce before known here. The abbot and convent of Oseney gave him the free use of their monastery on that occasion. He adds, that a still greater solemnity was performed some years after, at Gloucester College, by the Benedictines, for one William de Brooke, a monk of St. Peter's Monastery at Gloucester, who took the degree of D.D. in 1298, being the first of his Order who had attained that dignity. He was accompanied by the abbot and whole convent of his own monastery, the abbots of Westminster, Reading, Abingdon, Evesham, and Malmesbury, numerous other priors and monks, and by a hundred noblemen and esquires on horses richly caparisoned. (Wood, *ut sup.* pp. 65, 66.)

In Oxford the time requisite for the Doctor of Divinity's degree, subsequent to that of M.A., is eleven years: for a Doctor's of Civil Law, five years from the time at which the Bachelor of Laws' degree was conferred. Those who take this degree professionally, in order to practise in Doctors' Commons, are indulged with a shorter period, and permitted to obtain it at four instead of five years, upon making oath in convocation of their intentions so to practise. For the de

gree of M.D., three years must intervene from the time of the candidate's having taken his Bachelor of Medicine's degree. For a Doctor's degree in Divinity or Law three distinct lectures are to be read in the schools, upon three different days: but by a dispensation, first obtained in convocation or congregation, all three are permitted to be read upon the same day; so that by dispensation a single day is sufficient in point of time for these exercises. For a Doctor's degree in Medicine, a dissertation upon some subject, to be approved by the Professor of Medicine, must be publicly recited in the schools, and a copy of it afterwards delivered to the Professor.

In Cambridge a Doctor of Divinity must be a Bachelor of Divinity of five, or a M.A. of twelve years' standing. The requisite exercises are one act, two opponencies, a Latin sermon, and an English sermon. A Doctor of Laws must be a Bachelor of Laws of five years' standing. His exercises are one act and one opponency. Doctors of Physic proceed in the same manner as Doctors of Laws. For a Doctor's degree in music, in both Universities, the exercise required is the composition and performance of a solemn piece of music, to be approved by the Professor of the Faculty. (See the *Oxf. and Camb. Calendars for 1837.*)

Coloured engravings of the dresses worn by the doctors of the several faculties of Oxford and Cambridge will be found in Ackermann's *History of the Univ. of Oxford*, 4to., 1814, vol. ii. p. 259, *et seq.*; and in his *History of the Univ. of Cambridge*, 4to., 1815, vol. ii. p. 312, *et seq.*

DOCTORS' COMMONS, the College of Civilians in London, near St. Paul's Churchyard, founded by Dr. Harvey, Dean of the Arches, for the professors of the civil law. The official residences of the judges of the Arches' Court of Canterbury, of the judge of the Admiralty, and the judge of the Prerogative Court of Canterbury, are situated there. It is also the residence of the doctors of the civil law practising in London, who live there (for diet and lodging) in a collegiate manner, and common together, and hence the place is known by the name of Doctors' Commons. It was burnt down in the fire of London, and rebuilt at the charge of the profession. (*Chambrl Mag. Brit. Notitia.*) To the college belong a certain number of proctors, who manage causes for their clients, &c.

In the Common Hall are held all the principal spiritual courts, and the High Court of Admiralty.

DODDER. [CUSCUTACEÆ.]

DODDRIDGE, PHILIP, D.D. (birth in 1702, and death in 1751), a dissenting divine, who, on account of his singularly amiable disposition and manners, his ministerial assiduity, piety, and learning, is regarded as one of the ornaments of the religious community to which he belonged.

The community of which we speak is that of the Old Dissenters of England; those who adhered to the clergy who left the church when the Act of Uniformity, passed in 1662, soon after the return of Charles II. from exile, prescribed the terms of ministerial conformity. These persons formed a numerous and powerful party during the whole of that reign, and at length succeeded, though after much suffering, in enforcing their right to have their meeting-houses protected by law, and themselves allowed to assemble under the same protection which was extended to ministers and people who were willing to conform under that act. This right however was not recognised till after the revolution. The act of parliament which gave it is called the Act of Toleration, and was one of the first legislative measures of the new government, being passed in 1689.

The effect of it was, that the non-conforming or dissenting body became cast into societies, each with its own place of worship, where the usual ordinances of Christianity were administered; each having also its own pastor, who was either a minister who had been silenced by the act of 1662, or a minister who had been trained under those ministers and ordained by them.

Doddridge was born in one of these families living in London, where he had the early part of his education. He was then for a time at St. Albans, where lived a minister, Mr. Clarke, who was his great friend, and indeed patron, for the father of Doddridge had died while he was young, and had left little for the expense of his education. It was early perceived that his turn of mind peculiarly pointed to the profession of a minister, and he was entered at a dissenting academy over which Mr. John Jennings presided, the son of one of the ministers silenced in 1662. This academy was kept at the village of Kibworth in Leicestershire. Dr. Dodd-

ridge entered it in 1718 or 1719, and in 1722 commenced his ministry at Kibworth, his late tutor Mr. Jennings removing in that year to Hinckley, where he died in the succeeding year.

The death of Mr. Jennings was an important event in the history of Dr. Doddridge. Great expectations had been formed among the Dissenters of the success of Mr. Jennings in the education of ministers, and it was thought a point of importance to maintain an academy of that kind in one of the central counties. Mr. Jennings had mentioned his pupil Doddridge as being a person whom he thought eminently qualified to carry on the work, and the eyes of the Dissenters were generally directed to him as the person best qualified to do so.

However, several years passed, during which Doddridge was leading the life of a non-conformist minister, his services being divided between the people who attended the chapel at Kibworth, and the congregation at the neighbouring town of Market Harborough. He was diligent in his ministry both in public and private, but he found time also for much theological reading, by which means he qualified himself the better for the office which he and his friends had ever kept in view.

In 1729 he began his academy, which soon attained a high reputation. It was the institution in which most of the more distinguished ministers of the Old Dissenters in the middle of the eighteenth century were educated. It was first established at Market Harborough, where he at the time resided; but before the end of the year he removed to Northampton, having been invited to become the minister of the Dissenting congregation in that town; and at Northampton he continued both as pastor of the Dissenting congregation, and head of the Dissenting academy, till his death. He died at Lisbon thirteen days after his arrival. He had gone thither with little hope of recovery.

Doddridge lived at a time when the zeal of the class of persons to whom he belonged had lost some part of its ancient fervour. This he saw with regret, and was very desirous to revive it. This appears to have been a principal object, and one kept steadily in view both in his ministerial labours and his published writings. His printed sermons are remarkable for the earnestness with which he presses the great importance of a religious life, the evil of spiritual indifference or carelessness, and the indispensable necessity of uniting with the practice of the moral duties the cultivation of the spirit of piety, and a deep and serious regard to the momentous truths of religion. This appears particularly in a book of his which has been popular both at home and abroad, entitled 'The Rise and Progress of Religion in the Soul.' There is the same spirit of animated piety, and occasionally touches of genuine eloquence, in the practical part of another publication of his entitled 'The Family Expositor,' in which we have the whole Scriptures of the New Testament, (the gospels being in a harmony,) with a paraphrase, a series of critical notes, and reflections, or, as he calls them, improvements of each section into which the whole is divided. This work has also been often printed, and it may be regarded as an evidence of his learning, as well as of his piety; the notes abound with critical remarks, gathered out of numerous authors, or suggestions of his own mind, full of that knowledge which fits a man to illustrate those difficult writings. The course of metaphysical, ethical, and theological lectures, through which he conducted the young men who were trained by him for the christian ministry was published after his death, and forms an excellent text-book of systematic divinity, and (especially in the later edition by Dr. Kippis, in 2 vols. 8vo.) a very useful body of references to writers on almost every topic under the heads of metaphysics, ethics, or divinity. Nor must it be omitted that to him the Dissenters owe some of the best hymns which are sung by them in their public services.

Thus living a life of activity and usefulness, practising the virtues which he taught to others, and exhibiting a fine spirit of an unassuming piety, he lived greatly respected by many eminent persons beyond the pale of his own religious community, and in that community his death at so early an age was felt to be a great and general misfortune. His name is still never mentioned among them but with honour.

Two large accounts of his life have been published. The first by Job Orton, another divine of a kindred spirit, who belonged to the same community. the second by Dr. Kippis, a pupil of Dr. Doddridge, and also a minister, who has introduced it in the 'Biographia Britannica,' of which he

was the editor. The reader may see in these works all the detail of his public labours, his principles, and plan of lecturing, and will easily understand from them the influence of his character on the body to which he belonged. One of his descendants has within the last ten years given to the world a very large collection of his correspondence and private papers. In them we see his inmost mind.

DODECAGON, a figure of twelve sides; a term generally applied to an equiangular and equilateral (or regular) dodecagon.

The side of a regular dodecagon inscribed in a circle is $\cdot 5176380$ of the radius; and of that about a circle $\cdot 5358984$ of the radius. Similarly the radii of the circles inscribed in and circumscribed about a dodecagon are $1\cdot 8660254$ and $1\cdot 9318517$ of the side. The area of a dodecagon is three times the square of the radius of the circumscribed circle, or $11\cdot 1961524$ of the square on the side.

DODECAGYNIA, the name of any order in the Linnean classification of plants wherein the number of styles is twelve.

DODECAHEDRON. [SOLIDS, REGULAR.]

DODECANDRIA, the twelfth class in the Linnean classification of plants. It contains species having twelve or about twelve stamens, provided they do not adhere by their filaments.

DODO, DIDUS, a genus of birds generally supposed to be extinct, and whose very existence has been doubted. We have taken some pains to collect the evidence on this subject, and we here present it to our readers.

WRITTEN AND PICTORIAL EVIDENCE.

It appears that Vasco de Gama, after having doubled the Cape of Good Hope (Cabo Tormentoso, or Cape of Storms) in 1497, discovered, at sixty leagues beyond it, a bay, Angra de San Blaz, near an isle, where he saw a very great number of birds of the form of a goose, but with wings like those of the bats, which the sailors called solitaires. On their return, in 1499, the Portuguese touched again at San Blaz, where they took a great number of these birds, and comparing them to swans, called the island 'Ilha des Cisnes,' Isle of Swans.* In the voyage to the East Indies, in 1598, by Jacob Van Neck and Wybrand van Warwijk (small 4to., Amsterdam, 1648), there is a description of the *Walghvogels* in the island of Cerne, now called Mauritius, as being as large as our swans, with large heads, and a kind of hood thereon; no wings, but, in place of them, three or four black little pens (pennekens), and their tails consisting of four or five curled plumelets (plymkens) of a greyish colour. The breast is spoken of as very good, but it is stated that the voyagers preferred some turtle-doves that they found there. The bird appears with a tortoise near it, in a small engraving, one of six which form the prefixed plate.

In the frontispiece to De Bry (*Quinta Pars Indiæ Orientalis, &c.*, M.DCI), surmounting the architectural design of the title-page, will be found, we believe, the earliest engravings of the Dodo. A pair of these birds stand on the cornice on each side, and the following cut is taken from the figure on the left hand.

In De Bry's 'Descriptio Insulæ Do Cerne a nobis Mauritius dictæ' is the following account: 'Cerulean parrots also are there in great numbers, as well as other birds; besides which there is another larger kind, greater than our swans, with vast heads, and one half covered with a skin, as it were, hooded. These birds are without wings, in the place of which are three or four rather black feathers (quarum loco tres quatuorve pennæ nigriores prodeunt). A few curved delicate ash-coloured feathers constitute the tail. These birds we called *Walch-Vogel*, because the longer they were

* It is stated (Bourbon, vol. v., p. 577) that the island of Bourbon was discovered by the Portuguese navigator, Mascarenhas in 1442, and at that time was not inhabited; and that it received the name of Mascarenhas or Mascareignes.

cooked the more unfit for food they became (quod quo longius seu diutius elixarentur, plus lentescerent et esui inepiores fierent). Their bellies and breasts were nevertheless of a pleasant flavour (saporis jucundi) and easy of mastication. Another cause for the appellation we gave them was the preferable abundance of turtle-doves which were of a far sweeter and more grateful flavour.' It will be observed that the bill in De Bry's figure is comparatively small.

Clusius, in his 'Exotica' (1605), gives a figure, here copied, which, he says, he takes from a rough sketch in a journal of a Dutch voyager who had seen the bird in a voyage to the Moluccas in the year 1598.

The following is Willughby's translation of Clusius, and the section is thus headed: 'The Dodo, called by Clusius *Gallus gallinaceus peregrinus*, by Nieremberg *Cygnus cucullatus*, by Bontius *Dronte*.' 'This exotic bird, found by the *Hollanders* in the island called Cygnæa or Cerne, (that is the Swan Island) by the Portuguese, Mauritius Island by the Low Dutch, of thirty miles' compass, famous especially for black ebony, did equal or exceed a swan in bigness, but was of a far different shape; for its head was great, covered as it were with a certain membrane resembling a hood: beside, its bill was not flat and broad, but thick and long; of a yellowish colour next the head, the point being black. The upper chap was hooked; in the nether had a bluish spot in the middle between the yellow and black part. They reported that it is covered with thin and short feathers, and wants wings, instead whereof it hath only four or five long black feathers; that the hinder part of the body is very fat and fleshy, wherein for the tail were four or five small curled feathers, twirled up together, of an ash-colour. Its legs are thick rather than long, whose upper part, as far as the knee, is covered with black feathers; the lower part, together with the feet, of a yellowish colour: its feet divided into four toes, three (and those the longer) standing forward, the fourth and shortest backward: all furnished with black claws. After I had composed and writ down the history of this bird with as much diligence and faithfulness as I could, I happened to see in the house of Peter Pauwius, primary professor of physic in the university of Leyden, a leg thereof cut off at the knee, lately brought over out of Mauritius his island. It was not very long, from the knee to the bending of the foot being but little more than four inches, but of a great thickness, so that it was almost four inches in compass, and covered with thick-set scales, on the upper side broader, and of a yellowish colour, on the under (or back-side of the leg) lesser and dusky. The upper side of the toes was also covered with broad scales, the under side wholly callous. The toes were short for so thick a leg: for the length of the greatest or middlemost toe to the nail did not much exceed two inches, that of the other toe next to it scarce came up to two inches: the back-toe fell something short of an inch and a half; but the claws of all were thick, hard, black, less than an inch long; but that of the back-toe longer than the rest, exceeding an inch.* The mariners, in their dialect, gave this bird the name *Walch-Vogel*, that is, a nauseous or yellowish† bird; partly because after long boiling its flesh became not tender, but continued hard and of a difficult concoction, excepting the breast and gizzard, which they found to be of no bad relish, partly because they could easily get many *turtle-doves*, which were much more delicate and pleasant to the palate. Wherefore it was no wonder that in comparison of those they despised this, and said they could be well content without it. Moreover they said that they found certain stones in its gizzard, and no wonder, for all other birds, as well as these, swallow stones, to assist them in grinding their meat.' Thus far Clusius.'

In the voyage of Jacob Heemskerk and Wolfert Harmansz to the East Indies, in 1601, 1602, 1603 (small 4to., Amsterdam, 1648), folio 19, the *Dod-aarsen* (Dodos) are enumerated among the birds of the island of 'Cerne, now Mauritius;' and in the 'Journal of the East Indian Voyage of Willem Ysbrantsz Bontekoe van Hoorn, comprising

* We are indebted to Mr. Gray for the following measurement of the foot in the British Museum:—'Knee to ankle 4½ inches; circumference 4 inches; middle toe 3 inches; back toe 1½ inch; front claws, which are much worn, 8 lines; back claw, also much worn, shorter. Mr. Gray observes that the leg mentioned by Clusius is probably, from the similarity of the measurement, the specimen which was afterwards noticed by Grew, and finally came to the British Museum.'

† So in Willughby, but the print is somewhat indistinct, and there may be no error. In the original the words are 'Walch-Vogel, hoc est, nausum movens avis, partim quod, &c.' the word therefore is an interpolation.

many wonderful and perilous things that happened to him'—from 1618 to 1625 (small 4to., Utrecht, 1649)—under the head of the 'Island of Mauritius or Maskarinas,' mention is made (page 6) of the *Dod-eersen*, which had small wings, but could not fly, and were so fat that they scarcely could go.

Figure from Clusius.

Herbert, in his *Travels* (1634), gives a figure or rather figures of a bird that he calls 'Dodo,' and the following account:—'The Dodo comes first to our description, here, and in Dygarrois (and no where else, that ever I could see or hear of, is generated the Dodo). (A Portuguese name it is, and has reference to her simpleness), a bird which for shape and rareness might be called a Phoenix (wer't in Arabia); her body is round and extreme fat, her slow pace begets that corpulencie; few of them weigh lesse than fifty pound: better to the eye than the stomach: greasie appetites may perhaps commend them, but to the indifferently curious nourishment, but prove offensive. Let's take her picture: her visage darts forth melancholy, as sensible of nature's injurie in framing so great and massie a body to be directed by such small and complementall wings, as are unable to hoise her from the ground, serving only to prove her a bird; which otherwise might be doubted of: her head is variously drest, the one halfe hooded with downy blackish feathers; the other perfectly naked; of a whitish hue, as if a transparent lawne had covered it: her bill is very howked and bends downwards, the thrill or breathing place is in the midst of it; from which part to the end, the colour is a light greene mixt with a pale yellow; her eyes be round and small, and bright as diamonds; her cloathing is of finest downe, such as you see in goslings; her trayne is (like a China beard) of three or foure short feathers; her legs thick, and black, and strong; her tallons or pounces sharp; her stomach fiery hot, so as stones and iron are easily digested in it; in that and shape, not a little resembling the Africk oestriches: but so much, as for their more certain difference I dare to give thee (with two others) her representation.'—(4th ed., 1677.)

Herbert's figure.

Nuremberg's description (1655) may be considered a copy of that of Clusius, and indeed a whole work is a mere

compilation. As we have seen above, he names the bird *Cygnus cucullatus*.

In Tradescant's catalogue (*Musæum Tradescantianum*; or, a Collection of Rarities preserved at South Lambeth, near London, by John Tradescant, London, 1656, 12mo.), we find among the 'Whole Birds'—'Dodar, from the island Mauritius; it is not able to flie being so big.' That this was a Dodo there can be no doubt; for we have the testimony of an eye-witness, whose ornithological competency cannot be doubted, in the affirmative. Willughby at the end of his section on 'The Dodo,' and immediately beneath his translation of Bontius, has the following words: 'We have seen this bird dried, or its skin stuf in Tradescant's cabinet.' We shall, hereafter, trace this specimen to Oxford.

Jonston (1657) repeats the figure of Clusius, and refers to his description and that of Herbert.

Bontius, edited by Piso (1658), writes as follows: '*De Dronte, alii Dod-aers.*' After stating that among the islands of the East Indies is that which is called *Cerne* by some, but Mauritius 'a nostratibus,' especially celebrated for its ebony, and that in the said island a bird '*miræ conformationis*' called *Dronte* abounds, he proceeds to tell us—we take Willughby's translation—that it is 'for bigness of mean size between an ostrich and a turkey, from which it partly differs in shape, and partly agrees with them, especially with the African ostriches, if you consider the rump, quills, and feathers: so that it was like a pigmy among them, if you regard the shortness of its legs. It hath a great, ill-favoured head, covered with a kind of membrane resembling a hood; great black eyes; a bending, prominent fat neck; an extraordinary long, strong, bluish-white bill, only the ends of each mandible are of a different colour, that of the upper black, that of the nether yellowish, both sharp-pointed and crooked. It gapes huge wide as being naturally very voracious. Its body is fat, round, covered with soft grey feathers, after the manner of an *ostriches*: in each side instead of hard wing-feathers or quills, it is furnished with small, soft-feathered wings, of a yellowish ash-colour; and behind, the rump, instead of a tail, is adorned with five small curled feathers of the same colour. It hath yellow legs, thick, but very short; four toes in each foot, solid, long, as it were scaly, armed with strong, black claws. It is a slow-paced and stupid bird, and which easily becomes a prey to the fowlers. The flesh, especially of the breast, is fat, esculent, and so copious, that three or four *Dodos* will sometimes suffice to fill an hundred seamen's bellies. If they be old, or not well boiled, they are of difficult concoction, and are salted and stored up for provision of victual. There are found in their stomachs stones of an ash colour, of divers figures and magnitudes; yet not bred there, as the common people and seamen fancy, but swallowed by the bird; as though by this mark also nature would manifest that these fowl are of the *ostrich* kind, in that they swallow any hard things, though they do not digest them.'

Dronte. Figure from Bontius (wood-cut).

There is also a figure of the bird in the frontispiece, a copper-plate engraving.

It appears from Adam Olearius 'Die Gottorfsche Kunst Kammer, 1666), that there was a head to be seen in the Gottorf Museum; but the figure (Tab. xiii. f. 5) is very like that of Clusius. It is mentioned as the head of the *Walch-Vogel* and Clusius is referred to. In the plate the head is shaded, and has a more finished appearance: the rest of the bird is in outline.

Grew ('Museum Regalis Societatis; or a catalogue and description of the natural and artificial rarities belonging to the Royal Society,' London, folio, 1681), at p. 68, thus describes the bird which is the subject of our inquiry. 'The leg of a Dodo; called *Cygnus cucullatus* by Nieremburgius; by Clusius, *Gallus gallinaceus peregrinus*; by Bontius called *Dronte*, who saith that by some it is called (in Dutch) *Dod-aers*, largely described in Mr. Willughby's Ornithol. out of Clusius and others. He is more especially distinguished from other birds by the membranous hood on his head, the greatness and strength of his bill, the littleness of his wings, his bunchy tail, and the shortness of his legs. Abating his head and legs, he seems to be much like an ostrich, to which also he comes near as to the bigness of his body. He breeds in Mauris's Island. The leg here preserved is covered with a reddish-yellow scale. Not much above four inches long, yet above five in thickness, or round about the joints, wherein, though it be inferior to that of an *Ostrich* or *Cassowary*, yet, joined with its shortness, may render it of almost equal strength.' At p. 73, there is the following notice:—'The head of the *Man of War*, called also *Albitrosse*; supposed by some to be the head of a Dodo, but it seems doubtful. That there is a bird called the *Man of War* is commonly known to our seamen; and several of them who have seen the head here preserved, do affirm it to be the head of that bird, which they describe to be a very great one, the wings whereof are eight feet over. And Ligon (*Hist. of Barbadoe*, p. 61), speaking of him, saith, that he will commonly fly out to sea to see what ships are coming to land, and so return. Whereas the Dodo is hardly a volatile bird, having little or no wings, except such as those of the *Cassowary* and the *Ostrich*. Besides, although the upper beak of this bill doth much resemble that of the Dodo, yet the nether is of a quite different shape; so that this either is not the head of a Dodo, or else we have nowhere a true figure of it.' Grew then gives a very lengthened description of the skull which is figured by him (Tab. 6), and intituled 'Head of the *Albitros*,' as it doubtless was. The leg above mentioned is that now preserved in the British Museum, where it was deposited with the other specimens described by Grew, when the Royal Society gave their 'rarities' to that national establishment. Grew was a well qualified observer, and much of this description implies observation and comparison; indeed, though he does not refer to it, there is no reason for supposing that Grew was not familiar with Trallescant's specimen.

Charleton also (Onomasticon, 1688) speaks of the *Dodo Lunianorum*, *Cygnus cucullatus*, Willughby and Ray, and asserts that the Museum of the Royal Society of London contained a leg of the Dodo. This was evidently the leg above alluded to.

Leguat, in his description* of the Isle, 'which is called either Diego-Rodrigo, or Diego-Ruys, or Rodrigo,' gives the following account. 'We had also another creek on the other side of our cabbins, and full of oysters sticking to the rock. We went often to breakfast there, and brought some home, with which we made an excellent ragout with palm-tree-cabbages and turtle's fat. Of all the birds in the island, the most remarkable is that which goes by the name of the *Solitary* (*le Solitaire*), because it is very seldom seen in company, though there are abundance of them. The feathers of the males are of a brown-grey colour; the feet and beak are like a turkey's, but a little more crooked. They have scarce any tail, but their hind part covered with feathers is roundish, like the crupper of a horse; they are taller than turkeys. Their neck is straight, and a little longer in proportion than a turkey's when it lifts up its head. Its eye is black and lively, and its head without comb or top. They never fly, their wings are too little to support the weight of their bodies; they serve only to beat themselves and flutter when they call one another. They whirl about for twenty or thirty times together on the

same side during the space of four or five minutes; the motion of their wings makes then a noise very like that of a rattle, and one may hear it two hundred paces off. The bone of their wing grows greater towards the extremity, and forms a little round mass under the feathers as big as a musket-ball: that and its beak are the chief defence of this bird. 'Tis very hard to catch it in the woods, but easy in open places, because we run faster than they, and sometimes we approach them without much trouble. From March to September they are extremely fat, and taste admirably well, especially while they are young; some of the males weigh forty-five pound.

'The females are wonderfully beautiful, some fair, some brown; I call them fair because they are of the colour of fair hair: they have a sort of peak, like a widow's, upon their breasts, which is of a dun colour. No one feather is straggling from the other all over their bodies, being very careful to adjust themselves and make them all even with their beaks. The feathers on their thighs are round like shells at the end, and being there very thick, have an agreeable effect: they have two risings on their *craws*, and the feathers are whiter there than the rest, which lively represent the fine neck of a beautiful woman. They walk with so much stateliness and good grace, that one cannot help admiring them and loving them, by which means their fine mien often saves their lives.

'Though these birds will sometimes very familiarly come up near enough to one when we do not run after them, yet they will never grow tame: as soon as they are caught they shed tears without crying, and refuse all manner of sustenance till they die. We find in the gizzards of both male and female a brown stone, of the bigness of a hen's egg; it is somewhat rough, flat on one side, and round on the other, heavy and hard. We believe this stone was there when they were hatched, for let them be never so young, you meet with it always. They have never but one of them; and besides, the passage from the craw to the gizzard is so narrow, that a like mass of half the bigness could not pass. It served to whet our knives better than any other stone whatsoever. When these birds build their nests they choose a clean place, gather together some palm-leaves for that purpose, and heap them up a foot and a half high from the ground, on which they sit. They never lay but one egg, which is much bigger than that of a goose. The male and female both cover it in their turns, and the young is not hatched till at seven weeks' end: all the while they are sitting upon it, or are bringing up their young one,

Solitary Bird of Leguat.

* A new voyage to the East Indies by Francis Leguat and his companions, containing their adventures in two Desert Islands, &c., &c., London, 1708.

which is not able to provide for itself in several months, they will not suffer any other bird of their species to come within two hundred yards round of the place; but what is very singular is, the males will never drive away the females, only when he perceives one he makes a noise with his wings to call the female, and she drives the unwelcome stranger away, not leaving it till it is without her bounds. The female does the same as to the males, whom she leaves to the male, and he drives them away. We have observed this several times, and I affirm it to be true. The combats between them on this occasion last sometimes pretty long, because the stranger only turns about, and does not fly directly from the nest: however, the others do not forsake it till they have quite driven it out of their limits. After these birds have raised their young one, and left it to itself, they are always together, which the other birds are not; and though they happen to mingle with other birds of the same species, these two companions never disunite. We have often remarked, that some days after the young one leaves the nest, a company of thirty or forty brings another young one to it, and the new-fledged bird, with its father and mother joining with the band, march to some bye place. We frequently followed them, and found that afterwards the old ones went each their way alone, or in couples, and left the two young ones together, which we called a *marriage*. This particularity has something in it which looks a little fabulous; nevertheless, what I say is sincere truth, and what I have more than once observed with care and pleasure. The worthy narrator then indulges in some reflections on marriages in general, and early marriages in particular. It is worthy of note, with reference to the alleged juxtaposition of the bones of a large land-turtle and those of the dodo, to which we shall have occasion to allude, that the same author, in the description of the same island, speaks of the multitude of land-turtles; of which he says, 'I have seen one that weighed one hundred pound, and had flesh enough about it to feed a good number of men.'

The preceding cut is copied from Leguat's figure of 'the Solitary Bird.'

In the frontispiece is represented one in a sort of landscape, and also land-turtles; and in 'a plan of the settlement' in the Island of Rodrigo, many, some in pairs, are placed about. This plan shows the situation of the houses, &c., of Leguat and his companions: there are also land-turtles and other animals.*

We now proceed to trace the specimen which was in the Museum Tradescantium. There were, it seems, three Tradescants, grandfather, father, and son. The two former are said to have been gardeners to Queen Elizabeth, and the latter to Charles I. There are two portraits to the 'Museum,' one of 'Joannes Tradescantus pater' and the other of 'Joannes Tradescantus filius,' by Hollar. These two appear to have been the collectors: for John Tradescant, the son, writes in his address 'to the ingenious reader' that he 'was resolved to take a catalogue of those varieties and curiosities which my father had sedulously collected and my self with continued diligence have augmented, and hitherto preserved together.' This John Tradescant, the son, must have been the Tradescant with whom Elias Ashmole boarded for a summer when Ashmole agreed to purchase the collection, which was said to have been conveyed to Ashmole by deed of gift from Tradescant and his wife. Tradescant died soon after and Ashmole, in 1662, filed a bill in Chancery for a delivery of the curiosities. The cause is stated to have come to a hearing in 1664; and, in 1674, Mrs. Tradescant delivered up the collection pursuant to a decree in Chancery, and afterwards (April, 1678, some say) was found drowned in her own pond. Ashmole added to the collection, and presented it to the University of Oxford, where it became the foundation of the Ashmolean Museum. That the entire 'Dodar' went to Oxford with the rest of Tradescant's curiosities there can be no doubt. Hyde (*Religionis Veterum Persarum, &c., Historia*, 1700) makes particular mention of it as existing in

the Museum at Oxford. There, according to Mr Duncan, it was destroyed in 1755 by order of the visitors, and he thus gives the evidence of its destruction:—

'In the Ashmolean Catalogue, made by Ed. Lhwyd, Musæi Procustos, 1684 (Plott being the keeper), the entry of the bird is "No. 29. Gallus gallinaceus peregrinus Clusii, &c." In a Catalogue made subsequently to 1755, it is stated "That the numbers from 5 to 46, being decayed, were ordered to be removed at a meeting of the majority of the visitors, Jan. 8, 1755." Among these of course was included the Dodo, its number being 29. This is further shown by a new Catalogue, completed in 1756, in which the order of the visitors is recorded as follows: "Illa quibus nullus in margine assignatur numerus a Musæo subducta sunt cimelia, annuentibus Vice-Cancellario aliisque Curatoribus ad ea lustranda convocatis, die Januarii 8vo., A.D. 1755." The Dodo is one of those which are here without the number.' (Duncan *On the Dodo; Zool. Journ.*, vol. iii., p. 559.)

Upon this solemn sentence, which left to the Museum nothing but a foot and a head, Lyell makes the following observation: 'Some have complained that inscriptions on tomb-stones convey no general information, except that individuals were born and died, accidents which must happen alike to all men. But the death of a *species* is so remarkable an event in natural history that it deserves commemoration; and it is with no small interest that we learn from the archives of the University of Oxford, the exact day and year, when the remains of the last specimen of the Dodo, which had been permitted to rot in the Ashmolean Museum, were cast away; and the author concludes by giving the fatal record at length with becoming gravity.'

We now come to the celebrated painting in the British Museum, a copy of which, by the kind assistance of the officers of the zoological department, who have given us every assistance in prosecuting this inquiry, and who had it taken down for the purpose, we present to our readers.

It has been stated that the painting came into the possession of Sir Hans Sloane, president of the Royal Society, and that it was bought at his sale by Edwards, who, after publishing a plate from it in his *Gleanings*, presented it to the Royal Society, whence it passed, as well as the foot, into the British Museum. But Mr. Gray informs us that the foot only came with the museum of the Royal Society described by Grew; and that the picture was an especial gift from Edwards. Edwards's copy seems to have been made in 1760, and he himself says—'The original picture was drawn in Holland from the living bird brought from St. Maurice's Island in the East Indies in the early times of the discovery of the Indies by the way of the Cape of Good Hope. It was the property of the late Sir Hans Sloane to the time of his death; and afterwards becoming my property I deposited it in the British Museum as a great curiosity. The above history of the picture I had from Sir Hans Sloane and the late Dr. Mortimer, secretary to the Royal Society.'

M. Morel, Ecrivain Principal des Hôpitaux au Port-Louis de l'Isle de France, writes as follows in his paper 'Sur les oiseaux monstrueux nommés Dronte, Dodo, Cygne Capuchonné, Solitaire, et Oiseau de Nazare, et sur la petite Isle de Sable à 50 lieues environ de Madagascar.' 'These birds, so well described in the second volume of the 'History of Birds', by M. le Comte de Buffon, and of which M. de Borame has also spoken in his 'Dictionary of Natural History,' under the names of Dronte, Dodo, Hooded Swan (Cygne Capuchonné), Solitary or Wild Turkey (Dinde sauvage) of Madagascar, have never been seen in the isles of France, Bourbon, Rodriguez, or even the Seychelles lately discovered, during more than 60 years since when these places have been inhabited and visited by French colonists. The oldest inhabitants assure every one that these monstrous birds have been always unknown to them.' After some remarks that the Portuguese and Dutch who first overran these islands may have seen some very large birds, such as Emeus or Cassowaries, &c., and described them each after his own manner of observing, M. Morel thus proceeds: 'However this may be, it is certain that for nearly an age (depuis près un siècle) no one has here seen an animal of this species. But it is very probable that before the islands were inhabited, people might have been able to find some species of very large birds, heavy and incapable of flight, and that the first mariners who sojourned there soon destroyed them from the facility with which they were caught. This was what made the Dutch sailors call the

* Le premier auteur qui ait parlé du Solitaire parait être Castelnau, dans le récit d'un voyage fait en 1614, et publié seulement en 1690. Il toucha à l'île de Bourbon, alors nommée Mascaraigne par les Portugais, et encore inhabitée, quoique visitée depuis long-temps par les navigateurs. Parmi les oiseaux qu'il y remarqua, il en particularise une espèce de la grosseur d'un oie, très grande, avec des ailes courtes qui ne lui permettoient pas de voler. Cet oiseau avoit été, dit-il, nommé jusque là le géant, et l'île de France en produisoit beaucoup: il est blanc, et naturellement si doux, qu'on peut le prendre à la main; du moins ils étoient si peu effrayés à la vue des matelots, qu'il leur étoit aisé d'en tuer un très grand nombre avec des bâtons et des pierres. (De Blainville.)

Dodo, from the picture in the British Museum.

bird 'Oiseau de goût' (Walck-Voegel), because they were surfeited with the flesh of it. * * * But among all the species of birds which are found on this isle of sand and on all the other islets and rocks which are in the neighbourhood of the Isle of France, modern navigators have never found anything approaching to the birds above named, and which may be referred to the number of species which may have existed, but which have been destroyed by the too great facility with which they are taken, and which are no longer found excepting upon islands or coasts entirely uninhabited. At Madagascar, where there are many species of birds unknown in these islands, none have been met with resembling the description above alluded to.' (*Observations sur la Physique pour l'an 1778*, tom. xii., p. 154. Notes.)

Mr. Duncan thus concludes his paper above alluded to : 'Having applied, through the medium of a friend, to C. Telfair, Esq. of Port Louis, in the Mauritius, a naturalist of great research, for any information he could furnish or procure relating to the former existence of the Dodo in that island, I obtained only the following partly negative statement :—

'That there is a very general impression among the inhabitants that the Dodo did exist at Rodriguez, as well as in the Mauritius itself; but that the oldest inhabitants have never seen it, nor has the bird or any part of it been preserved in any museum or collection formed in those islands, although some distinguished amateurs in natural history have passed their lives on them, and formed extensive collections. And with regard to the supposed existence of the Dodo in Madagascar, although Mr. Telfair had not received, at the time of his writing to Europe, a reply to a letter on the subject which he had addressed to a gentleman resident on that island, yet he stated that he had not any great expectations from that quarter; as the Dodo was not mentioned in any of his voluminous manuscripts respecting that island, which contained the travels of persons who had traversed Madagascar in all directions, many of them having no other object in view than that of extending the bounds of natural

We close this part of the case with the evidence of one evidently well qualified to judge, and whose veracity there is no reason to doubt. If this evidence be, as we believe it to be, unimpeachable, it is clear not only that the Dodo existed, but that it was publicly exhibited in London. The lacunæ in the print represent the spaces occasioned by a hole burnt in the manuscript.

In Sloane MSS. (No. 1839, 5, p. 108, Brit. Mus.) is the following interesting account by L'Estrange in his observations on Sir Thomas Browne's 'Vulgar Errors.' It is worthy of note that the paragraph immediately follows one on the 'Estridge' (Ostrich).

'About 1638, as I walked London streets I saw the picture of a strange fowl hung out upon a cloth vas and myselfe with one or two more Gen. in company went in to see it. It was kept in a chamber, and was a great fowle somewhat bigger than the largest Turkey Cock and so legged and footed but stouter and thicker and of a more erect shape, coloured before like the breast of a yong Cod Fesan (pheasant), and on the back of dunn or deare colour. The keeper called it a Dodo and in the ende of a chimney in the chamber there lay an heap of large pebble stones whereof hee gave it many in our sight, some as bigg as nutmegs, and the keeper told us shee eats them conducting to digestion and though I remember not how farre the keeper was questioned therein yet I am confident that afterwards she cast them all awayne.*'

EVIDENCE ARISING FROM REMAINS.

The only existing recent remains attributed to the Dodo are, a leg in the British Museum, and a head (a cast of which is in Brit. Mus.), and a leg in the Ashmolean Museum at Oxford, the relics most probably of Tradescant's bird. Whether the leg formerly in the museum of Pauw be that at present in the British Museum may be, perhaps, doubtful, though we think with Mr. Gray that they are probably

* This curious statement is extracted in the recent edition of Sir Thomas Browne's works by Wilkins: published by Pickering.

identical; but that the specimen in the British Museum did not belong to Tradescant's specimen is clear, for it existed in the collection belonging to the Royal Society when Tradescant's 'Dodar' was complete. In the 'Annales des Sciences' (tome xxi. p. 103, Sept. 1830) will be found an account of an assemblage of fossil bones, then recently discovered, under a bed of lava, in the Isle of France, and sent to the Paris Museum. They almost all belonged to a large living species of land-tortoise, called *Testudo Indica*, but amongst them were the head, sternum, and humerus of the dodo. 'M. Cuvier,' adds Mr. Lyell in his "Principles of Geology," 'showed me these valuable remains at Paris, and assured me that they left no doubt in his mind that the huge bird was one of the gallinaceous tribe'

Head of Dodo (from cast of Oxford specimen.)

Foot of Dodo (specimen in the British Museum.)

In a letter addressed to the Secretary of the Zoological Society, by Charles Telfair, Esq., Corr. Memb. Z. S., dated Port Louis (Mauritius), November 8, 1832, and read before a meeting of the society on the 12th March, 1833, it appeared that Mr. Telfair had recently had opportunities of making some researches about the buried bones of the Dronte or Dodo found in the Island of Rodriguez. The result of these researches he communicated, and enclosed letters addressed to him by Col. Dawkins, military secretary to the Governor of the Mauritius, and by M. Eudes, resident at Rodriguez.

Col. Dawkins, it was stated, in a recent visit to Rodriguez, conversed with every person whom he met respecting the *Dodo*, and became convinced that the bird does not exist there. The general statement was that no bird is to be found there except the *Guinea-fowl* and *Parrot*. From one person, however, he learned the existence of another bird, which was called *Oiseau-bœuf*, a name derived from its voice, which resembles that of a cow. From the description given of it by his informant, Col. Dawkins at first believed that this bird was really the *Dodo*; but on obtaining a specimen of it, it proved to be a *Gannet* (apparently referable to the *Lesser Gannet* of Dr. Latham, the *Sula candida* of Brisson, and the *Pelecanus Piscator* of Linnæus). It is found only in the most secluded parts of the Island. Col. Dawkins visited the caverns in which bones have been dug up, and dug in several places, but found only small pieces of bone. A beautiful rich soil forms the ground-work of them, which is from six to eight feet deep, and contains no pebbles. No animal of any description inhabits these caves, not even bats.

M. Eudes succeeded in digging up in the large cavern various bones, including some of a large kind of bird, which no longer exists in the Island: these he forwarded to Mr. Telfair, by whom they were presented to the Zoological Society. The only part of the cavern in which they were found was at the entrance, where the darkness begins; the little attention usually paid to this part by visitors may be the reason why they have not been previously found. Those near the surface were the least injured, and they occur to the depth of three feet, but nowhere in consider-

able quantity; whence M. Eudes conjectured that the bird was at all times rare, or at least uncommon. A bird of so large a size as that indicated by the bones had never been seen by M. Gory, who had resided forty years on the island. M. Eudes added that the Dutch who first landed at Rodriguez left cats there to destroy the rats which annoyed them: these cats have since become very numerous, and prove highly destructive to poultry; and he suggested the probability that they may have destroyed the large kind of bird to which the bones belonged, by devouring the young ones as soon as they were hatched,—a destruction which may have been completed long before the Island was inhabited.

The bones procured by M. Eudes for Mr. Telfair were presented by that gentleman to the Zoological Society. At the reading of the letter, &c., they were laid on the table, and consisted of numerous bones of the extremities of one or more large species of *Tortoise*, several bones of the hinder extremity of a large bird, and the head of a *humerus*. With reference to the metatarsal bone of the bird, which was long and strong, Dr. Grant pointed out that it possessed articulating surfaces for four toes, three directed forwards and one backwards, as in the foot of the *Dodo* preserved in the British Museum, to which it was also proportioned in its magnitude and form. (Zool. Proc. 1833. Part 1.)

OPINIONS OF ZOOLOGISTS AND SUPPOSED PLACE IN THE ANIMAL SERIES.

Piso, in his edition of Bontius, places the *Dodo* immediately before the *Cassowary*; and here we may observe that the figure of Bontius does not appear to be identical with the picture which now hangs in the British Museum. Though there is a general resemblance there are particular differences which go far to show, at all events, that the figure of Bontius and that in the picture are different portraits.

Willughby's eighth chapter treats of 'The greatest land-birds, of a peculiar kind by themselves, which, by reason of the bulk of their bodies, and the smallness of their wings, cannot fly, but only walk. The *Ostrich* occupies the 1st section of this chapter, and the *Dodo* the fourth and last, being immediately preceded by 'the *Cassowary* or *Emeu*. Ray's section 'Aves rostris rectoribus minusque hamatis maximæ, singulares et sui generis, ob corporum molem et alarum brevitatem volandi impotes' contains the same birds as Willughby's eighth chapter, viz.: the *Ostrich*, the *American Ostrich*, the *Emeu*, *Eme* or *Cassowary*, and, lastly, the *Dodo*.

Moehring, and after him, Brisson, gives the bird, under the name of *Raphus*, a position next to the *Ostriches* also Buffon places it independently.

Linnæus, in his last edition of the 'Systema Naturæ' (the 12th, 1766), places the bird at the head of his '*Gallinæ*,' the order immediately succeeding the '*Grallæ*,' under the name of *Didus ineptus*, and immediately before the genus *Pavo* (Peacocks). The genus *Struthio* is the last of his *Grallæ*, and *Rhea* (American Ostrich) the last species of *Struthio*, so that *Didus ineptus* stands between *Struthio Rhea*, Linn., and *Pavo cristatus* (the Peacock). In a former edition Linnæus had noticed the bird under the name *Struthio cucullatus*.

Latham in his synopsis (1782) followed Linnæus, but gave three species, viz., the *Hooded Dodo*, the *Solitary Dodo*, and the *Nazarene Dodo*.

Gmelin, in his edition of the 'Systema Naturæ' (1789), makes *Propheta* (Trumpeter) the last genus of the Linnæan *Grallæ*, and *Otis* (Bustard) the first genus of the Linnæan *Gallinæ*, under which last-mentioned order he arranges the genus *Didus*, placing it between the genera *Struthio* and *Pavo*, which are both included by Gmelin in the order *Gallinæ*. He also gives three species:—1st. *Didus ineptus*, which he describes as 'black, clouded with white, with tetradactyle feet.' The following are his synonyms:—*Didus*, Syst. Nat. xii. 1, p. 267, n. 1; *Struthio cucullatus*, Syst. Nat. x. p. 155; *Raphus*, Briss. Av. 5, p. 14, n. 1; *Cygnus cucullatus*, Nieremb. Nat. 251; *Gallus gallinaceus peregrinus*, Clus. Exot. 99, t. 10; Olear. Mus. 23, t. 13, f. 5; *Dronte*, Bont. Jav. 70, Buff. Hist. Nat. des Ois. i. p. 480; *Dod-aersen* or *Valgh-Vogel*, Herbert it. p. 382, t. 383; *Dodo*, Raj. Av. p. 37, n. 8; Will. Orn. p. 153, t. 27; Edw. Glean. t. 294; *Hooded Dodo*, Lath. Syn. iii. 1, p. 1, t. 70. 2nd. *Didus solitarius* · *Solitaire*, Buff. Hist. Nat.

des Ois. i. p. 485; Leguat it. i. p. 98; *Solitary Dodo*, Lath. Syn. iii. 1, p. 3, n. 2. This species is described by Gmelin as 'varied with grey and brown, with tetradactyle feet.' 3rd. *Didus Nazarenus*; *Oiseau de Nazareth, et Oiseau de Nausée*, Buff. Hist. Nat. des Ois. i. p. 485; Cauche, Madag. p. 130; *Nazarene Dodo*, Lath. Syn. iii. 1, p. 4, n. 3. Gmelin describes this species as 'black, with tetradactyle feet.'

Blumenbach followed Linnæus; and Duméril and Vieillot followed Latham.

Temminck instituted in his 'Analyse du Système Général d'Ornithologie,' the order *Inertes*, for the *Dodo* and the *Apteryx*; two birds, as Mr. Yarrell in his paper on the *Apteryx* (*Trans. Zool. Soc.*, vol. i., p. 71) observes, differing decidedly from each other in their beaks; but in reference to their imperfect wings, as also in the nature of their external covering, having obvious relation to the species included in his order *Cursores*. 'But,' adds Mr. Yarrell, 'the situation chosen for this order *Inertes*, at the extreme end of his systematic arrangement, leads me to infer that M. Temminck considered as imaginary the subjects for which it was formed.'

Illiger, in his *Prodromus* (1811), instituted the order *Inepti* for the reception of the *Dodo* alone, *Apteryx* not being then known, and he placed it immediately preceding his *Cursores*, containing the *Struthious Birds*.

Cuvier, in the first edition of his *Règne Animal* at the end of his notice on his family *Brevipennes* (*Les Autruches, Struthio*, Linn.), has the following note appended to his description of the last species, *Rhea*. 'I cannot place in this table species but badly known, or, more, so little authentic as those which compose the genus *Didus*. The first or the *Dronthe* (*Didus ineptus*) is only known from a description given by the first Dutch navigators, and preserved by Clusius, *Exot.* p. 99, and by an oil-painting of the same epoch copied by Edwards, pl. 294; for the description of Herbert is puerile, and all the others are copied from Clusius and Edwards. It would seem that the species has entirely disappeared, and we now possess no more of it at the present day than a foot preserved in the British Museum (Shaw, *Nat. Miscell.* pl. 143), and a head in bad condition in the Ashmolean Museum at Oxford. The bill does not seem to be without some relation to that of the *Auks* (*Pinguins*), and the foot would bear considerable resemblance to that of the *Penguins* (*Manchots*), if it were palmed. The second species, or the *Solitaire* (*Didus Solitarius*), rests only on the testimony of Leguat, *Voy.* i. p. 98, a man who has disfigured the best known animals, such as the *Hippopotamus* and *Lamantin*. Finally, the third species, or *L'Oiseau de Nazare* (*Didus Nazarenus*), is only known through François Cauche, who regards it as the same as the *Dronthe*, and yet only gives it three toes, while all other authors give four to the *Dronthe*. No one has been able to see any of these birds since these voyagers.' In the second edition (1829), the note is repeated with the addition of a notice of *Apteryx*. With every reverence for the great zoologist who wrote it, it is impossible to avoid observing the haste and incorrectness which mark it. His opinions certainly underwent considerable modification. When he was in this country at the period of the last French revolution, he had an opportunity of seeing the head preserved in the Ashmolean Museum, and the foot in the British Museum, and he doubted the identity of this species with that of which the painting is preserved in the National collection. Lyell mentions these doubts, and we must here recall to the reader the geologist's statement above alluded to, that Cuvier showed him the valuable remains in Paris, and that he assured him that they left no doubt on his mind that the huge bird was one of the Gallinaceous tribe. (*Sur Quelques Ossements, &c.*, *Ann. des Sci.*, tome xxi., p. 103, Sept., 1830.)

Shaw, as appears indeed from Cuvier's note, made mention of the *Dodo* in his *Naturalist's Miscellany* (plates 142 and 143), giving a figure of the head preserved in the Ashmolean Museum, and in his *Zoological Lectures*. The continuer of his 'Zoology' has the following sweeping notice of the bird:—'The *Dodo* of Edwards appears to have existed only in the imagination of that artist, or the species has been utterly extirpated since his time, which is scarcely probable. Its beak is said to be deposited in the Ashmolean Museum at Oxford, and a foot in the collection in the British Museum. The former appears rather to belong to some unknown species of albatross than to a bird of this order, and the latter to another unknown bird; but upon

what authority it has been stated to belong to the *Dodo*, I am at a loss to determine. A painting by Edwards still exists in the British Museum.'

'This hasty judgment,' says Mr. Duncan in his paper in the *Zoological Journal*, 'is fully refuted, especially by the existing head, and the exact resemblance of the leg at Oxford to that in London.'

Mr. Vigors, in his paper 'On the Natural Affinities that connect the Orders and Families of Birds' (*Linn. Trans.*, vol. xiv., p. 395, read December 3, 1823), thus writes on the subject of the *Dodo*:—'Considerable doubts have arisen as to the present existence of the Linnæan *Didus*; and they have been increased by the consideration of the numberless opportunities that have latterly occurred of ascertaining the existence of these birds in those situations, the isles of Mauritius and Bourbon, where they were originally alleged to have been found. That they once existed I believe cannot be questioned. Besides the descriptions given by voyagers of undoubted authority, the relics of a specimen preserved in the public repository of this country, bear decisive record of the fact. The most probable supposition that we can form on the subject is, that the race has become extinct in the before-mentioned islands, in consequence of the value of the bird as an article of food to the earlier settlers, and its incapability of escaping from pursuit. This conjecture is strengthened by the consideration of the gradual decrease of a nearly conterminous group, the *Otis tarda* of our British ornithology, which, from similar causes, we have every reason to suspect will shortly be lost to this country. We may, however, still entertain some hopes that the *Didus* may be recovered in the south-eastern part of that vast continent, hitherto so little explored, which adjoins those islands, and whence, indeed, it seems to have been originally imported into them. I dwell upon these circumstances with more particularity, as the disappearance of this group gives us some grounds for asserting, that many chasms which occur in the chain of affinities throughout nature may be accounted for on the supposition of a similar extinction of a connecting species. Here we have an instance of the former existence of a species that, as far as we can now conclude, is no longer to be found; while the link which it supplied in nature was of considerable importance. The bird in question, from every account which we have of its economy, and from the appearance of its head and foot, is decidedly Gallinaceous; and, from the insufficiency of its wings for the purposes of flight, it may with equal certainty be pronounced to be of the *Struthious* structure, and referable to the present family. But the foot has a strong hind toe, and, with the exception of its being more robust,—in which character it still adheres to the *Struthionidae*,—it corresponds exactly with the foot of the Linnæan genus *Cyras*, that commences the succeeding family. The bird thus becomes osculant, and forms a strong point of junction between these two conterminous groups; which, though evidently approaching each other in general points of similitude, would not exhibit that intimate bond of connexion which we have seen to prevail almost uniformly throughout the neighbouring subdivisions of nature, were it not for the intervention of this important genus.'

M. Lesson, in his *Manual* (1828), after giving a description of the *Dodo* (genus *Dronthe*, *Didus*, Linn., *Raphus*, Moehring, Brisson), says that the genus includes but one species which may be considered as at all authenticated, and which exists no longer; this is the *Dronthe*, *Didus ineptus*, described by Clusius, ex. p. 99, figured by Edwards, pl. 294. 'They possess,' he adds, 'a foot and head of it at London, figured in Shaw's *Miscell.*, pl. 143 and 166.' Then comes the following statement:—'M. Temminck has adopted, after Shaw, the genus *Apteryx*, which he thus describes.' M. Lesson, after giving the description and noticing the only known species, *Apteryx Australis*, proceeds to make the following queries: 'May not the *Dronthe* be the *Cassowary* of the East Indies, to which has been added the bill of an Albatross? It is said that it was once very common in the Islands of France and of Bourbon, and that the former received the name of the Isle of Cerne from these birds. May not the *Apteryx* of M. Temminck be founded on the fragments of the *Dronthe* preserved in the Museum of London?' To make the confusion complete, M. Lesson places immediately before the genus *Dronthe* the *Emou Kivikivi*, *Dromiceus Novæ Zelandiæ*, Less., which is no other than the *Apteryx Australis* of Shaw, and which has been so well described and figured by Mr.

Yarrell in the first volume of the Transactions of the Zoological Society of London.

M. de Blainville, in a memoir on the *Didus ineptus*, read before the Academy of Sciences, on the 30th of August, 1830, and published in the 'Nouvelles Annales du Muséum d'Histoire Naturelle' (tome iv., p. 1, 4to., Paris, 1835), enters at large into the history of the bird, and terminates his list of authors thus: 'Finally, not long ago (assez dernièrement) in England, an anonymous author, whom I believe to be Mr. Mac Leay, has returned to the idea that this genus ought to be placed among the Gallinaceous birds. Nevertheless, although he pronounces that the *Dronte* is decidedly a bird of this family, he adds, that it may, with the same certainty, be referred to the *Struthionidae*, on account of the smallness of its wings; but, adds he, as the foot is provided with a hallux (pouce), it departs (s'éloigne) from this family to approach the genus *Corax*, qui doit la commencer, according to him. Thus it is one of those genera which he names osculant, forming the passage from one group to another.' Who this anonymous author may be we do not presume to guess, but we have the best authority for asserting that Mr. W. S. Mac Leay is not the person. From the context, we think it probable that Mr. Vigors's opinions above given are alluded to, *Corax* being a misprint for *Craz*.

M. de Blainville, after giving the different points on which the claim of the *Dodo* to be considered a gallinaceous bird rests, and the reasons for and against it, thus proceeds:— 'Among the orders of birds which include the largest species, there only remain the birds of prey with which the *Dodo* can be compared; and it seems to us that it is to them that the bird bears the greatest resemblance.' In proof of this it is necessary to attend to the following observations:—

1. The eyes are situated in the same part of the bill as in *Cathartes*.
2. The nostrils are oval, situated very forward, and without a superior scale, as in those birds.
3. The form of the skull, its great width in the inter-orbital space, and its flatness at the sinciput, are also nearly the same as in those vultures.
4. Even the colour of the bill, and the two caruncular folds of the origin of the curved part, are nearly the same as in those birds.
5. The species of hood which the skin forms at the root of the bill, and which have earned for the *Dodo* the name of *Cygnus cucullatus*, has a very similar disposition in *Cathartes*.
6. The almost entire nudity of the neck, as well as its greenish colour seen through the few downy feathers which cover it, are also characteristic of the vulture.
7. The form, the number, and the disposition of the toes, as well as the force and curvature of the claws, indicate a bird of that family at least as much as a gallinaceous bird.
8. The scaly system of the tarsi and of the toes more resembles also what is found in *Cathartes* than what is observed in the *Gallinaceous birds*.
9. The kind of *Jabot* at the root of the neck, and even the muscular stomach, are found in one order as well as in the other.
10. Lastly, M. de Blainville notices the absence of the spur (*Pergot*), which he remarks is nearly characteristic of the *Gallinaceous birds*.

M. de Blainville, after expressing a hope that both the *Aye-Aye* (*Cheiromys*, which has not been seen a second time since the days of Sonnerat) and the *Dodo* may be yet recovered in the interior of Madagascar, thus concludes his memoir:—

1. There exist in the English collections traces of at least three individuals of a large species of walking bird (*oiseau marcheur*), to which has been given the name of *Dodo*, *Dronte*, *Didus ineptus*.

2. These traces exist in Europe since the epoch when the Dutch began to take part in the discovery of the passage to the East Indies by the Cape of Good Hope, that is to say, about 1594.

3. The name of *Dodo* is employed for the first time by Herbert; that of *Dronte* by Piso, but without its being possible to arrive at the origin and etymology of these denominations.

4. The country of this bird is the Isle of France; there being nothing to prove positively that it has been found either at Bourbon or at Fernandez, as has been thought,

owing to the confusion, no doubt, between the *Dodo* and *Solitaire* of Leguat.

5. The *Dronte* should be approximated to or even placed in the order of rapacious birds, near the vultures, rather than in that of the Gallinaceous birds, and, for stronger reasons, rather than among the *Grallatores* (*Echassiers*), or near the *Penguins* (*Manchots*).

6. It is by no means certain that this bird has disappeared from the number of living animals. If this is possible in the case of the Isle of France, it is not probable in the case of Madagascar, the productions of which are so little known, and which belongs, up to a certain point, to the same archipelago.

There remains another question to discuss, namely, whether the incrustated bones which have been lately sent to M. Cuvier from the Isle of France really belonged to the *Dodo*, as M. Cuvier was led to believe. It is a question which would be most easily solved by the immediate comparison of these bones with the pieces preserved in England. If this was so, which the difference of height in the tarsal bone does not permit us to believe, it would be at the same time proved that the *Dodo* existed also at Rodriguez, for these bones have been found in this isle in a cave (grotte), as M. Quoy, who saw them on his passage to the Isle of France, has assured me, and not at the Isle of France, under beds of lava, as M. Cuvier has stated from erroneous information, in his note read lately to the academy. Then there would be nearly a certainty that the *Dodo* was a Gallinaceous bird; but in making the observation that these bones come from the Isle of Fernandez, and that the description of the *Solitaire* of Leguat accords sufficiently well with a bird of this order, or at least with a *Gallinogallie*, it might be that the bones actually in the hands of M. Cuvier were no other than those of the *Solitary Bird* properly so called, and not those of the true *Dronte*.

The memoir is illustrated with four plates: the first is a coloured copy of the head of the *Dodo* from the Museum portrait, of the size of the original. In the painting the author observes the head is at least a foot long from the occiput to the extremity of the bill; but the head at Oxford is only eight inches and a half, or about two-thirds. The bill, he adds, makes out nearly three-fourths of the whole length. The second plate gives a profile of the Oxford head from a sketch taken from the original, and a view of the same seen from above, and skulls of the *Urubu* and *Vultur Papa*. Plate 3 gives two views of the foot preserved in the British Museum, and the remains of the foot at Oxford; a foot of the *Heath-cock* (*Coq de Bruyère*), a foot of a *Penguin*, and a foot of *Vultur Papa*. Plate 4 gives a profile of the cast of the head at Oxford, and a view of the same seen from below.

In the British Museum (1837) in cases 65—68 (Room XIII.) are the *Ostrich*; *Bustards* 'which in many respects are allied to the *Gallinaceous Birds*;' the foot and cast of the head of the *Dodo* above alluded to: the *Courser* and *Pratincole*; and at p. 99 of the Synopsis (1832) we have the following observations: 'Over the door adjoining the twelfth room is an original painting of the *Dodo*, presented to the Museum by George Edwards, Esq., the celebrated ornithological artist, and copied in his works, plate No. 294, who says it was 'drawn in Holland, from a living bird brought from St. Maurice's Island in the East Indies.' The only remains of this bird at present known are a foot (case 65) in this collection (presented by the Royal Society) and a head and foot, said to have belonged to a specimen which was formerly in Tradescant's Museum, but is now in the Ashmolean Museum at Oxford. The cast of the head above mentioned (in the same case) was presented by P. Duncan, Esq. The bird in the shortness of the wings resembles the ostrich, but its foot, in general, rather resembles that of the common fowl, and the beak, from the position of its nostrils, is most nearly allied to the Vultures: so that its true place in the series of birds, if indeed such a bird ever really existed, is not, as yet, satisfactorily determined.'

Mr. Swainson (*Natural History and Classification of Birds*, 1836), speaking of the birds of prey, says (p. 285), 'The third and last type of this family appears to us to be the *Secretary Vulture* of Africa, forming the genus *Gypogerymus*. At least we cannot assign it to any other known division of the *Raptores*, without separating it much more widely from its congeners than our present state of knowledge will sanction. It has been thought, indeed, that this

remarkable bird represented one of the primary divisions of the whole order; in which case it would stand between the owls and the *Dodo*: but its similarity to the vultures and the falcons, in our opinion, is too great to favour this supposition; while, on the other hand, it will subsequently appear that the circle of the *Falconidae* is sufficiently complete to show that it does not enter into that family.' After some other observations, Mr. Swainson concludes his observations on the *Secretary* thus: 'It must be remembered, also, that the very same objections occur against placing this bird (the *Secretary*) between the *Strigidae* (owls) and the *Dididae* (Dodos), as those we have intimated against considering it as the grallatorial type of the *Vulturidae*.'

That a bird or birds called by the name of *Dodo* and the other appellations which we need not here repeat once existed, we think the evidence above given sufficiently proves. We have, indeed, heard doubts expressed whether the Museum portrait was taken 'from a living bird,' and have also heard it suggested that the picture may represent a specimen made up of the body of an ostrich to which the bill and legs of other birds have been attached. And here it is that the destruction of Tradescant's specimen becomes a source of the greatest regret. Whatever was the condition of that specimen, as long as the skin was preserved there existed the means of ascertaining whether it was real or a made-up monster; and when the Vice-Chancellor and the other curators in making their lustration gave the fatal nod of approbation they destroyed that evidence. With regard to the picture we have endeavoured to place it before the reader as well as our limited means will permit, in order that he may have an opportunity of judging from the internal evidence as to the probability of the portrait being taken from a living bird, and with this view we have given the accessories as they appear in the painting as well as the principal figure.

Mr. Gray, among others, still inclines, we believe, to the opinion that the bird represented was made up by joining the head of a bird of prey approaching the Vultures, if not belonging to that family,* to the legs of a Gallinaceous bird, and his opinion, from his attainments and experience, is worthy of all respect. But, if this be granted, see what we have to deal with. We have then two species, which are either extinct or have escaped the researches of all zoologists to account for, one, a bird of prey, to judge from its bill, larger than the Condor; the other a Gallinaceous bird, whose pillar-like legs must have supported an enormous body. As to the stories of the disgusting quality of the flesh of the bird found and eaten by the Dutch, that will weigh but little in the scale when we take the expression to be, what it really was, indicative of a comparative preference for the turtle-doves there found, after feeding on *Dodos usque ad nauseam*. 'Always Partridges' has become almost proverbial, and we find from Lawson how a repetition of the most delicious food palls. 'We cooked our supper,' says that traveller, 'but having neither bread nor salt, our fat turkeys began to be loathsome to us, although we were never wanting of a good appetite, yet a continuance of one diet made us weary;' and again, 'By the way our guide killed more turkeys, and two polcats, which he eat, esteeming them before fat turkeys.'

With regard to the form of the bill, we must be careful how we lay too much stress on that. Who would have expected to find a bill 'long, slender, smooth, and polished, in form resembling that of an *Ibis*, but rather more straight

* Mr. Gray's reasons for considering the *Dodo* as belonging to the *Raptores* chiefly rest on the following facts, premising, as he does, that it is to be borne in mind that in the Raptorial birds the form of the bill is their chief ordinal character, which is not the case with the *Grallatores* or the *Natatores*, where the form of the feet and legs are the chief character of the order.

1. The base of the bill is enveloped in a *Cere*, as may be seen in the cast where the folds of the *Cere* are distinctly exhibited, especially over the back of the nostrils. The *Cere* is only found in the Raptorial birds.

2. The nostrils are placed exactly in front of the *Cere*, as they are in the other *Raptores*: they are oval, and nearly erect, as they are in the true Vultures, and in that genus alone, and not longitudinal as they are in the *Cathartes*, all the *Gallinaceous birds*, *Grallatores* and *Natatores*, and they are naked and covered with an arched scale, as is the case in all the *Gallinacea*.

3. In Edwards's picture the bill is represented as much hooked (like the *Raptores*) at the tip; a character which unfortunately cannot be verified on the Oxford head, as that specimen is destitute of the horny sheath of the bill, and only shows the form of the bony core.

With regard to the size of the bill, it is to be observed, that this part varies greatly in the different species of vultures, indeed so much, so that there is no reason to believe that the bird of the Oxford head was much larger than some of the known vultures.

With regard to the foot,* adds Mr. Gray, 'it has all the characters of that of the *Gallinaceous birds*, and differs from all the vultures in the shortness of the middle toe, the form of the scales on the leg, and the bluntness of the claws.

and depressed at the base*,' on an Emeu-like body with rasorial legs and feet? Yet such is the form of *Apteryx*. As to the argument arising from the absence of the spur it is worth but little at best; and it may be said in favour of those who would place the *Dodo* between the Struthious and Gallinaceous birds, that its absence in such an osculant bird would be expected.

If the picture in the British Museum, and the cut in Bon-tius be faithful representations of a creature then living, to make such a bird a bird of prey—a Vulture, in the ordinary acceptance of the term—would be to set all the usual laws of adaptation at defiance. A Vulture without wings! How was it to be fed? And not only without wings, but necessarily slow and heavy in progression on its clumsy feet. The *Vulturidae* are, as we know, among the most active agents for removing the rapidly decomposing animal remains in tropical and intertropical climates, and they are provided with a prodigal development of wing to waft them speedily to the spot tainted by the corrupt incumbrance. But no such powers of wing would be required by a bird appointed to clear away the decaying and decomposing masses of a luxuriant tropical vegetation,—a kind of Vulture for vegetable impurities, so to speak,—and such an office would not be by any means inconsistent with comparative slowness of pedestrian motion.

DODONA, the most ancient oracle of Greece, was probably situated in the valley of Joannina in Epirus, but its exact position has never been ascertained. Dionysius of Halicarnassus places it four days' journey from Butthrotum, and two from Ambracia. (*Antiqu. Rom.* i. 5.) Colonel Leake places it at the south-east extremity of the lake of Joannina, near Kastritza (*Travels in Northern Greece*, vol. iv., p. 168, and following), and there are many reasons for believing that the Dodonæan territory corresponded to the valley at the south of that sheet of water. It is true that there is no mention of a lake in the neighbourhood of the ancient Dodona; but it is described as surrounded by marshes, and it is not unlikely that the lake of Joannina may have been increased in later times from the catavothra in the country. (Leake, iv. p. 189.) The temple at Dodona was dedicated to Jupiter, and was of Pelasgian origin. (Hom. *Iliad*, xvi. 233; Herod. ii. 52.) Strabo is of opinion (vii. p. 328), that the priests at this temple were originally men, but that the duties of the office were afterwards performed by three old women. The people who had the management of the temple are called *Selli* or *Helli*. (Creuzer, *Symbol.* i., p. 193, note 359.) The oracles were delivered from an oak (Sophocles, *Trachin.* 1171) or beech (Hesiod. *ap. Strabon.*, p. 327; Sophocles, *Trach.* 173). The temple at Dodona was entirely destroyed by Dosimachus, the Ætolian prætor, B.C. 219 (Polyb. iv. 67), and probably was never restored, for it did not exist in the time of Strabo (p. 327); but there was a town of the name in the seventh century A.D., and a bishop of Dodona is mentioned in the council of Ephesus. (Wesseling on Hierocle's *Synecdocha*, p. 651.)

There is a long article on Dodona in the Fragment of Stephanus Byzantinus, which is printed at the end of his work.

DODSLEY, ROBERT, was born in 1703, at Mansfield, in Nottinghamshire, where his father is said to have kept the free school. Robert and several brothers, however, appear to have all commenced life as working artisans, or servants. Robert is said to have been put apprentice to a stocking-weaver, from whom, finding himself in danger of being starved, he ran away, and took the place of a footman. After living in that capacity with one or two persons, he entered the service of the Honourable Mrs. Lowther, and while with that lady he published by subscription in 1732 an octavo volume of poetical pieces, under the title of 'The Muse in Livery, or the Footman's Miscellany.' The situation of the author naturally drew considerable attention to this work at the moment of its appearance; but the poetry was of no remarkable merit. His next production was a dramatic piece, called 'The Toyshop'; he sent it in manuscript to Pope, by whom it was much relished, and who recommended it to Rich, the manager of Covent Garden theatre, where it was acted in 1735 with great success. With the profits of his play Dodsley the same year set up as a bookseller; and, under the patronage which Pope's friendship and his own reputation and talents procured him, his shop

in Pall Mall soon became a distinguished resort of the literary loungers about town. His business, which he conducted with great spirit and ability, prospered accordingly; and in his latter days he might be considered as standing at the head of the bookselling trade. He continued also throughout his life to keep himself before the public in his first profession of an author, and produced a considerable number of works of varying degrees of merit, both in prose and verse. In 1737 his farce of 'The King and the Miller of Mansfield' was acted at Drury Lane with great applause. It was followed the same year by a sequel, under the title of 'Sir John Cockle at Court,' which however was not so successful. Nor was he more fortunate with his ballad farce of 'The Blind Beggar of Bethnall Green,' which was brought out at Drury Lane in 1741. This year also he set up a weekly magazine, under the title of 'The Public Register,' to which he was himself a principal contributor; but it was discontinued after the publication of the twenty-fourth number. It is curious to note that, in his farewell address to his readers, he complains that certain rival magazine publishers (understood to mean the proprietors of the Gentleman's Magazine) had exerted their influence with success to prevent the newspapers from advertising his work. In 1745 he published another short dramatic piece, entitled 'Rex et Pontifex, being an attempt to introduce upon the stage a new species of pantomime;' but this never was acted. A collected edition of all these dramas was published in 1748, in a volume, to which he gave the title of 'Trifles.'

The following year he produced a masque on the subject of the peace of Aix-la-Chapelle, under the title of 'The Triumphs of Peace,' which was set to music by Dr. Arne, and performed at Drury Lane. In 1750 appeared anonymously his ingenious and well known little work, 'The Economy of Human Life,' which was long attributed to Lord Chesterfield, and was from the first extremely popular. The first part, entitled 'Agriculture,' of a poem in blank verse, on the subject of public virtue, which he published in 1754, was so coldly received that the second and third parts which he originally contemplated were never produced. In 1758 he closed his career of dramatic authorship with a tragedy entitled 'Cleone,' which was acted at Covent Garden with extraordinary applause, and drew crowded audiences during a long run. When it was published, 2000 copies were sold the first day, and it reached a fourth edition within the year. 'Cleone,' however, is now nearly forgotten; although Dr. Johnson declared that if Otway had written it he would have been remembered for nothing else,—a compliment which the modest author, when it was reported to him, observed with some displeasure was 'too much.' Dodsley died at Durham, while on a visit to a friend, on the 25th of September, 1764. He had retired from business some years before, having made a good fortune. Dodsley's name is associated with several works of which he was only the projector and the publisher, but from his connexion with which he is now more generally remembered than for his own productions. Among them may be mentioned the two periodical works, 'The Museum,' begun in 1746 and extended to three volumes, in which there are many able essays by Horace Walpole, the two Warton's, Akenside, &c. (of this Dodsley was only one of the shareholders), and 'The World,' 1754-57, conducted by Edward Moore, and contributed to by Lords Lyttelton, Chesterfield, Bath, and Cork, Horace Walpole, Soame Jenyns, &c.; 'The Preceptor,' 2 vols., 1748, to which Johnson wrote a preface; and especially the 'Annual Register,' begun in 1758, and still carried on and known by his name. [ANNUAL REGISTER.] These and the other works in which he was engaged brought him into intimate connexion with most of the eminent men belonging to the world of letters during the period of his able and honourable career. He has also the credit of having first encouraged the talents of Dr. Johnson, by purchasing his poem of London in 1738, for the sum of ten guineas, and of having many years afterwards been the projector of the English Dictionary. A second volume of Dodsley's collected works, forming a continuation of the 'Trifles,' was published under the title of 'Miscellanies,' in 1772. (Besides the articles in the second edition of the 'Biographia Britannica,' in Chalmers, and in the 'Biographia Dramatica,' there are many notices respecting Dodsley in Nichols's 'Literary Anecdotes of the Eighteenth Century.')

DODSWORTH, ROGER, an eminent antiquary, was

the son of Matthew Dodsworth, registrar of York Cathedral, and chancellor to Archbishop Matthews. He was born July 24, 1585, at Newton Grange in the parish of St. Oswald, in Rydale, Yorkshire. He died in the month of August, 1654, and was buried at Rufford in Lancashire. His manuscript collections, partly relating to Yorkshire, in a hundred and sixty-two volumes folio and quarto, a hundred and twenty-two of them in his own hand-writing, were bequeathed to the Bodleian Library at Oxford, in 1671, by General Fairfax, who had been Dodsworth's patron. Chalmers says that Fairfax allowed Dodsworth a yearly salary to preserve the inscriptions in churches.

Dodsworth was the projector, and collected many of the materials for the early part of the work now known as 'Dugdale's Monasticon,' in the title page of the first volume of which his name appears as one of the compilers.

There is a detailed catalogue of the contents of Dodsworth's collections, now in the Bodleian, in the great catalogue of the Manuscripts of England and Ireland, fol. Oxon. 1697. (Gough's *Brit. Top.* vol. i. pp. 123-4; Chalmers's *Biogr. Dict.* vol. xii. p. 180; and the pref. to the last edition of the *Monasticon.*)

DODWELL, HENRY, was born in Dublin in 1642. His father, who had been in the army, possessed some property in Ireland, but having lost it in the rebellion, he brought over his family to England, and settled at York, in 1648. Young Dodwell was here sent to the free school, where he remained for five years. In the meantime both his father and mother had died, and he was reduced for a season to great difficulties and distress from the want of all pecuniary means, till, in 1654, he was taken under the protection of a brother of his mother's, at whose expense he was sent, in 1656, to Trinity College, Dublin. Here he eventually obtained a fellowship, which however he relinquished in 1666, owing to certain conscientious scruples against taking holy orders. In 1672, on his return to Ireland, after having resided some years at Oxford, he made his first appearance as an author by a learned preface, with which he introduced to the public a theological tract of the late Dr. Stearn, who had been his college tutor: it was entitled 'De Obstatione,' and published at Dublin. Dodwell's next publication was a volume entitled 'Two Letters of Advice: 1. For the Susception of Holy Orders: 2. For Studies Theological, especially such as are rational.' It appeared in a second edition in 1681, accompanied with a 'Discourse on the Phœnician History of Sanchoniathon,' the fragments of which, found in Porphyry and Eusebius, he contends to be spurious. Meanwhile, in 1674, Dodwell had settled in London, and from this time to his death he led a life of busy authorship. Many of his publications were on the popish and nonconformist controversies; they have the reputation of showing, like everything else he wrote, extensive and minute learning, and great skill in the application of his scholarship, but little judgment of a larger kind. Few, if any, of the champions of the church of England have strained the pretensions of that establishment so far as Dodwell seems to have done; but his whole life attested the perfect conscientiousness and disregard of personal consequences under which he wrote and acted. In 1698 he was elected Camden Professor of History by the University of Oxford, but was deprived of his office, after he had held it about three years, for refusing to take the oath of allegiance to William and Mary. He now retired to the village of Cookham in Berkshire, and soon after to Shottesbrooke in the same neighbourhood, where he spent the rest of his days. He possessed, it appears, an estate in Ireland, but he allowed a relation to enjoy the principal part of the rent, only reserving such a moderate maintenance for himself as sufficed for his simple and unexpensive habits of life. It is said however that his relation at length began to grumble at the subtraction even of this pittance; and on that Dodwell resumed his property, and married. He took this step in 1694, in his 53rd year, and he lived to see himself the father of ten children. The works for which he is now chiefly remembered were also all produced in the latter part of his life. Among these are his Dissertations and Annotations on the Greek Geographers, published in Hudson's 'Geographiam Veteris Scriptores Græci Minores,' Oxon. 1698, 1703, and 1712; his 'Annales Thucydidei et Xenophontei,' 1696; his 'Chronologia Græco-Romana pro Hypothesibus Dion. Halicarnassæi,' 1692; and his 'Annales Velleiani, Quintilianici, Statiani,' 1698. These several chronological essays, which are drawn up with great ability, have all been

repeatedly reprinted. Dodwell's principal work is considered to be his 'De Veteribus Græcorum Romanorumque Cyclicis, Obiterque de Cyclo Judæorum ac Ætate Christi, Dissertationes,' 4to., Oxon., 1701. He also published in 8vo., in 1706, 'An Epistolary Discourse, proving from the Scriptures and the first Fathers, that the Soul is a principle naturally mortal, but immortalized actually by the pleasure of God, to punishment or to reward, by its union with the divine baptismal spirit; where it is proved that none have the power of giving this divine immortalizing spirit since the Apostles, but only the Bishops.' This attempt to make out for the bishops the new power of conferring immortality raised no small outcry against the writer, and staggered many even of those who had not seen any extravagance in his former polemical lucubrations. Of course it gave great offence to the Dissenters, all of whose souls it unceremoniously shut out from a future existence on any terms. Dodwell died at Shottesbrooke on the 7th of June, 1711. Of his sons, the eldest, Henry, who was a barrister, published anonymously in 1742, a tract, which has been generally, but perhaps erroneously, looked upon as a covert attack upon revealed religion, under the title of 'Christianity not founded on Argument;' and another, William, who was in the church, distinguished himself by some pamphlets in the controversy with Dr. Conyers Middleton about miracles; and also wrote an answer to his brother's anonymous tract just mentioned.

DOG, the English name for the digitigrade quadruped which is so faithfully attached to man.

Under the Linnæan genus *Canis* are to be found the dogs (*Canis familiaris*); the wolves (*Canis Lupus*); the hyænas (*Canis Hyæna*); the foxes (*Canis Vulpes*, &c.); the jackals (*Canis aureus*); the Mexican wolf (*Canis Mexicanus*), *Xoloitzcuintli* of Hernandez: and *Canis Thous* of Surinam.

Cuvier arranges under the genus *Canis* 'les Chiens,' the dogs properly so called (*Canis familiaris* and its varieties); the wolves (*Canis Lupus*, *C. Mexicanus*, *C. jubatus*); and the jackals (*Chacal* ou *Loup doré*, *Canis aureus*); and he observes, that the foxes (which Brisson and others have separated under the name of *Vulpes*) may be distinguished from the wolves and the dogs by their longer and more tufted tail; by a more pointed muzzle; by the pupils of their eyes, which by day present a kind of longitudinal slit instead of the round form; and by the superior incisors being less lobated (echancrées); and he observes on their fetid odour, their disposition to dig for themselves earthen, and to prey upon the weaker animals. These he places in a subgenus, including the *Zerda* (*Megalotis* of Illiger, *Canis Megalotis* of Lalande, *Canis Zerda* of Gmelin); at least he terms the *Zerdas* *espèces de renards*, though he seems to consider them as a section, and notices them as the *Megalotis* of Illiger: the *Hyæna venatica* of Burchell, *Hyæna picta* of Temminck (wild dog of the Cape), terminates Cuvier's *Canidæ*, and he then passes on to the civets (*Viverra*).

M. Lesson, in his Manual, begins the second section of the Digitigrades with the genus *Canis*, and he adopts the following subdivisions:—

1st. Those genera which have the pupil of the eye round, including the dogs properly so called, the wolves, and the jackals.

2d. Those genera in which the pupil of the eye contracts vertically, the foxes and the zerdas.

3d. The dogs with hyæna-like feet; the hyæna-dog, *Canis pictus*, Desm., *Hyæna picta*, Temm., *Lycæon*, Brookes.

This article will be confined to a consideration of the dog, *Canis familiaris*, and its varieties: the other subfamilies will be treated of under their respective titles.

The specific description given by Linnæus of *Canis familiaris* is simply 'Canis caudâ (sinistrosum) recurvatâ'—'dog with tail curled towards the left'—and his lengthened description, after enumerating the varieties, of which he gives eleven, though it may appear to some almost ridiculously minute and not very delicate, is eminently characteristic. Cuvier observes that the domestic dog, *Canis familiaris*, Linn., is distinguished by its recurved tail, and that it varies infinitely besides, in stature, form, colour, and the quality of the hair. It exhibits, he adds, 'the most singular, the most complete, and the most useful conquest that man has made. The whole species is become our property; each individual is entirely devoted to his master,' P. C., No. 538.

adopts his manners, distinguishes and defends his property, and remains attached to him even unto death; and all this springs not from mere necessity, nor from constraint, but simply from *reconnaissance* and a true friendship. The swiftness, the strength, and the highly developed power of smelling of the dog, have made him a powerful ally of man against the other animals, and were perhaps necessary to the establishment of society. It is the only animal that has followed man all over the earth.'

Now comes the question—What was the parent-stock of this faithful friend of man? Some zoologists are of opinion that the breed is derived from the wolf; others that it is a familiarized jackal; all agree that no trace of it is to be found in a primitive state of nature. That there were dogs, or rather animals of the canine form, in Europe long ago, we have evidence from their remains, which we shall presently notice; and that there are wild dogs we know. India, for example, affords many of them, living in a state of complete independence, and without any indication of a wish to approach the dwellings of man. These dogs, though they have been accurately noticed by competent observers, do not throw much light on the question. They may have escaped from the dominion or half dominion of man, and have betaken themselves to a vagabond life. It becomes necessary however to examine into the state of these dogs, some of which are entirely wild, and keep to the mountain and forest, whilst others hang about the villages, and though without owners, give tokens of a more social disposition, and are tolerated as the scavengers of the place, which they clear of disgusting incumbrances, somewhat after the Portuguese fashion.

Col. Sykes thus describes the Dukhun (Deccan) dog, *Canis Dukhunensis*, Sykes, *Kolsun* of the Mahrattas. 'Red, paler underneath; tail bushy, pendulous; pupil rounded.' 'This is the *Wild Dog* of Dukhun. Its head is compressed and elongated; its nose not very sharp, the eyes are oblique: the pupils round, *irides* light brown. The expression of the countenance that of a coarse ill-natured *Persian Greyhound*, without any resemblance to the *Jackal*, the *Fox*, or the *Wolf*, and in consequence essentially distinct from the *Canis Quao*, or *Sumatrensis* of General Hardwicke. Ears long, erect, somewhat rounded at the top, without any replication of the *tragus*. Limbs remarkably large and strong in relation to the bulk of the animal; its size being intermediate between the *Wolf* and the *Jackal*. Neck long. Body elongated. Between the eyes and nose red brown: end of the tail blackish. From the tip of the nose to the insertion of the tail 33 inches in length: tail 8½ inches. Height of the shoulders, 16½ inches.' Colonel Sykes adds that none of the *domesticated dogs* of Dukhun are common to Europe. The first in strength and size is the *Brinjaree Dog*, somewhat resembling the *Persian Greyhound*, then (1831) in the possession of the Zoological Society, but much more powerful. The *Pariah Dog*, he states, is referable to M. Cuvier's second section. This is very numerous, not individual property, but breeds in the towns and villages unmolested. The Colonel remarks that the *Turnspit Dog*, long backed, with short crooked legs, is frequently found among the *Pariahs*. There is also a petted minute variety of the *Pariah Dog*, usually of a white colour, and with long silky hair, corresponding to a common *Lap-dog* of Europe; this is taught to carry flambeaux and lanterns. The last variety noticed is the *Dog* with hair so short as to appear naked like the *Canis Egyptianus*. It is known to Europeans by the name of the *Polygar Dog*. (*Zool. Proc.*, part i., 1831.) In 1832 the skin of the *Wild Dog* of Nepál was compared by Colonel Sykes with a specimen of the *Kolsun* of the Mahrattas above described, and he stated his impression to be that the animals are identical, differing only by the denser coat and more woolly feet of the Nepál race, a difference readily accounted for by the greater cold of the elevated regions inhabited by it. He declined however pronouncing a decided opinion, which, he thought, could only be arrived at by more extensive comparison and a full acquaintance with the habits of the *Wild Dog* of Nepál. (*Zool. Proc.*, part ii.) In 1833, Colonel Sykes placed on the table of the Zoological Society his specimen of the *Wild Dog* of Dukhun (*Canis Dukhunensis*, Sykes), for the purpose of comparing it with a skin of the *Wild Dog* of Nepál, (*Canis primævus*, Hodgson), then recently presented to the Society by the last-named gentleman. He showed that the two dogs are perfectly similar in their general form, and in the form of the *cranium*; and

that in his specimen, equally with that of Mr. Hodgson, the hinder tubercular tooth of the lower jaw is wanting. The only difference remarkable between the two specimens was in the quality and colour of the fur, that of the *Dukhun Dog* being paler and less dense than that of the individual from Nepal. These differences, depending probably on climate and individual peculiarity, cannot be regarded as sufficient to indicate a distinction between the two races. Identical as they are in form and habits, Colonel Sykes considered them as belonging to one species. (*Zool. Proc.*, part i., 1833, and see a more detailed account in the 'Transactions of the Royal Asiatic Society.')

Mr. Hodgson, in a paper 'On the *Mammalia* of Nepal,' published in the 'Journal of the Asiatic Society of Calcutta,' mentions, *inter alia*, under the title of *Canis familiaris*, Linn., the *Pariah* as the only *Dog* of the lower and central regions. The *Thibetan Mastiff*, he states, is limited to Kachar (Cachar), into which it was introduced from its native country, but in which it degenerates rapidly; there are, he observes, several varieties of it; he also notices his *Canis primævus*. (*Zool. Proc.*, part ii., 1834.)

These contributions we consider very interesting; but we must be on our guard against the begging of the question, which lurks under the specific name *primævus*, given by a gentleman to whom Indian zoology owes so much, and it is for this reason that we have laid before the reader the comparative views of Colonel Sykes, who has so widely extended our knowledge of the Oriental Fauna.

Mr. Bell in his 'History of British Quadrupeds,' approaches this difficult question more boldly than most zoologists. 'In order,' says Mr. Bell, 'to come to any rational conclusion on this head, it will be necessary to ascertain to what type the animal approaches most nearly, after having for many successive generations existed in a wild state, removed from the influence of domestication and of association with mankind. Now we find that there are several different instances of the existence of dogs in such a state of wildness as to have lost even that common character of domestication, variety of colour and marking. Of these two very remarkable ones are the Dhole of India, and the Dingo of Australia: there is besides a half-reclaimed race amongst the Indians of North America; and another, also partially tamed, in South America, which deserve attention; and it is found that these races, in different degrees, and in a greater degree as they are more wild, exhibit the lank and gaunt form, the lengthened limbs, the long and slender muzzle, and the great comparative strength which characterize the wolf; and that the tail of the Australian dog, which may be considered as the most remote from a state of domestication, assumes the slightly bushy form of that animal. We have here then a considerable approximation to a well-known wild animal of the same genus, in races which, though doubtless descended from domesticated ancestors, have gradually assumed the wild condition; and it is worthy of especial remark, that the anatomy of the wolf, and its osteology in particular, does not differ from that of the dogs in general, more than the different kinds of dogs do from each other. The cranium is absolutely similar, and so are all, or nearly all, the other essential parts; and to strengthen still further the probability of their identity, the dog and wolf will readily breed together, and their progeny is fertile. The obliquity of the position of the eyes in the wolf is one of the characters in which it differs from the dogs; and although it is very desirable not to rest too much upon the effects of habit or structure, it is not perhaps straining the point to attribute the forward direction of the eyes in the dogs to the constant habit, for many successive generations, of looking forwards to their master and obeying his voice.'

Another criterion, and a sound one is, the identity of gestation. Sixty-three days form the period during which the bitch goes with young. Precisely the same time elapses before the she-wolf gives birth to her offspring. Upon Buffon's instance of seventy-three days, or rather the possibility of such a duration in the gestation of a particular she-wolf, we do not lay much stress when opposed by such strong evidence of the usual period being sixty three days. The young of both wolf and dog are born blind, and see at the same or about the same time, viz., at the expiration of the tenth or twelfth day.

Hunter's important experiments proved without doubt that the wolf and the jackal would breed with the dog; but he had not sufficient data for coming to the conclusion that

all three were identical as species. In the course of those experiments he ascertained that the jackal went fifty-nine days with young, whilst the wolf went sixty-three, nor does he record that the progeny of the dog and jackal would breed together: and he knew too well the value of the argument to be drawn from a fertile progeny not to have dwelt upon the fact if he had proved it; not to have mentioned it, at least, if he had ever heard of it.

Skull of Jackal; from F. Cuvier.

Mr. Bell disposes of the objection arising from the alleged untameably savage disposition of the wolf by relating two anecdotes, one on his own authority, and the other on that of M. F. Cuvier, in proof of the susceptibility of attachment to man, and the appetite—for it is an appetite—for his caresses on the part of the wolf. The first occurred in the Gardens of the Zoological Society in the Regent's Park, London, and was exhibited in the person of a she-wolf, who came forward to be caressed, and even brought her pups to be caressed also, whenever Mr. Bell or any one whom she knew approached her den. Indeed she killed all her unfortunate young ones in succession, by rubbing them against the bars of her cage in her zeal to have them fondled by her friends. The second happened in the Ménagerie du Roi at Paris, and no faithful dog could show more affecting instances of attachment to his master or distress on account of his absence than did the male wolf which is the subject of M. F. Cuvier's touching account. 'With all these analogous properties of form and structure'—we quote Mr. Bell—'as well as of disposition, I cannot but incline at least to the opinion that the wolf is the original source from which all our domestic dogs have sprung: nor do I see in the great variety which exists in the different races sufficient ground for concluding that they may not, all of them, have descended from one common stock. The turnspit and the mastiff, the pug and the greyhound, are perhaps more unlike each other than any of the varieties of other domestic animals; but if it be true that variation depends upon habit and education, the very different employments to which dogs have in all ages been trained, and the various climates to which they have been naturalized, must not be lost sight of as collateral agents in producing these different forms. The care, too, with which dogs of particular breeds are matched with similar ones, for the purpose of keeping the progeny as pure as possible, has doubtless its effect in promoting such distinctions.' The same author thus sums up his opinion. 'Upon the whole, the argument in favour of the view which I have taken, that the wolf is probably the original of all the canine races, may be thus stated: the structure of the animal is identical, or so nearly so as to afford the strongest *a priori* evidence in its favour. The dog must have been derived from an animal susceptible of the highest degree of domestication, and capable of great affection for mankind; which has been abundantly proved of the wolf. Dogs having returned to a wild state, and continued in that condition through many generations, exhibit characters which approximate more and more to those of the wolf, in proportion as the influence of domestication ceases to act. The two animals will breed together, and produce fertile young. The period of gestation is the same.

We now lay before our readers the skull of a wolf, that they may compare it with those of the different varieties of dogs.

Skull of Wolf; from F. Cuvier.

Skull of Canada Wolf; from F. Cuvier.

Dog.

Dental formula: incisors, $\frac{6}{6}$; canines, $\frac{1-1}{1-1}$; molars,

$\frac{6-6}{7-7} = 42$. Such is M. Lesson's statement of the dentition of the great genus *Canis* of Linnæus. M. F. Cuvier says, that dogs in general have forty-nine teeth, viz. six incisors, two canines, three false molars, one carnassier, and two tubercular teeth in the upper jaw; and six incisors, two canines, three false molars, one carnassier, and two tubercular teeth in the lower jaw. Of all these teeth, he observes, none change their shape in any appreciable degree in any race whatever. Only there is sometimes found an additional false molar or tubercular tooth.*

Fore feet with five toes; hind feet with four toes; claws not retractile.

* M. F. Cuvier observes that these supernumerary teeth are developed in each jaw, but that he never saw them developed on each side in the same individual. When, for example, the left intermaxillary bone has a fifth false molar, the right intermaxillary bone has only the usual number; and it is the same with regard to the supernumerary tubercular teeth which is sometimes found in the upper jaw. As these modifications are not perpetuated, M. F. Cuvier places them among those casualties which give no foundation for the establishment of any rule.

Teeth of Dog.

Feet of Dogs; from F. Cuvier.

Generally speaking, all dogs have five toes on the fore feet, and four on the hind feet, with the rudiment of a fifth metatarsal bone, which does not show itself externally. Nevertheless some dogs have this fifth toe very long and well proportioned, and advancing as far as the origin of the first phalanx of the neighbouring toe; and in those dogs which have only a rudimentary fifth bone of the tarsus, this bone articulates itself to the lower facet of the great cuneiform bone, which is itself placed in relation with the scaphoid bone, the second cuneiform bone, and the second bone of the metatarsus, counting as one the rudiment in question. But in the dogs that have the fifth toe complete, a fourth cuneiform bone is developed between the first and the second toe, and in that case, in some varieties, the great cuneiform bone elevates itself, and on its internal side offers a large articulating facet to the astragalus.

The tail is very variable in the number of caudal vertebrae which range from twenty-one down to three or even two.

In following out our inquiry as to the domesticated dog, we naturally seek for that variety which is found with man in his most uncivilized state, as the point of commencement. Some of the New Hollanders, perhaps, approach nearer to the state of nature than any other savages. Let us see what dog is associated with these people.

The New Holland dog, or as it is more generally termed, the Australian dog or Dingo, is so wolf-like in its appearance, that Bewick figures it as 'the New South Wales wolf.' Governor Phillip describes the height of this species, when standing erect, as rather less than two feet, and the length two feet and a half. The head, he says, is formed much like that of a fox, the ears short and erect, with whiskers from one to two inches in length on the muzzle. The general colour of the upper parts is pale brown, growing lighter towards the belly; the hind part of the fore-legs, and the fore part of the hinder ones white, as are the feet of both the tail is of a moderate length, somewhat bushy, but in a less degree than that of a fox: the teeth, he adds, are much the same as is usual in the genus.

Skull of Dingo; from F. Cuvier.

This description may be considered as accurate, with the exception that the animal generally bears a greater affinity to the wolf than the fox. 'It has,' says the author last quoted, describing a female, 'much of the manners of the dog, but is of a very savage nature, and not likely to change in this particular. It laps like other dogs, but neither barks nor growls if vexed and teased; instead of which, it erects the hairs of the whole body like bristles, and seems furious: it is very eager after its prey, and is fond of rabbits or chickens raw, but will not touch dressed meat. From its fierceness and agility it has greatly the advantage of other animals much superior in size; for a very fine French fox-dog being put to it, in a moment it seized him by the loins and would have soon put an end to his existence had not help been at hand. With the utmost ease it is able to leap over the back of an ass, and was very near worrying one to death, having fastened on it so that the creature was not able to disengage himself without assistance; it has also been known to run down both deer and sheep. A second

of these is in the possession of Mr. Lasceles, of which we have received much the same account in respect of its ferocity; whence it is scarcely to be expected that this elegant animal will ever become familiar.'

Dampier, in his voyage to New Holland (1699), well describes the Dingos, where he says that his men saw two or three 'beasts like hungry wolves, lean like so many skeletons, being nothing but skin and bones.' Indeed ill-treatment of the dog seems to be the characteristic of savage or semi-barbarous nations. Thus Lawson, in his *History of Carolina*, 'When all the viands were brought in, the first figure began with kicking out the dogs, which are seemingly wolves, made tame with starving and beating, they being the worst dog-masters in the world; so that it is an infallible cure for sore eyes ever to see an Indian's dog fat.' Among the oriental nations the natives of Java seem to treat their dogs almost as scurvy as the wild American Indians did in Lawson's time. (DEER, vol. viii., p 362-3.) To return to the Dingo. Mr. Bennett, in his *Gardens and Menagerie of the Zoological Society*, vol. i. (1830), thus writes:—'The specimens in the Garden appear to have shaken off some of their original wildness, and to have begun to accustom themselves in some degree to the circumstances in which they are placed. One of them has been for nearly two years in the Society's possession: the second is a much later acquisition.' This is remarkable as indicative of an approach to greater domestication, but the following statement by Mr. Bell, in his work above quoted (1836), carries this much farther, and enables us to trace the first effect of the more mild dominion of man upon this wolf-like dog. 'The effect of domestication in producing variation in colour, to which allusion has already been made, has lately been exhibited in a very striking and interesting manner in the menagerie of the Zoological Society. An Australian bitch, or Dingo, had a litter of puppies, the father of which was also of that breed: both of them had been taken in the wild state, but were of the uniform reddish brown colour which belongs to the race, and the mother had never bred before; but the young, bred in confinement, and in a half domesticated state, were all of them more or less spotted.

Dingo, *Canis familiaris Australasicus*.

'If we turn to the dogs of other comparatively uncivilized nations we find the prick ears and other indications of the half-reclaimed animal. The Esquimaux dog, *Canis familiaris Borealis*, and the Hare-Indian, or Mackenzie River dog, *Canis familiaris Lagopus*, will occur as instances to those who have been familiar—and who are not?—with the histories of our northern expeditions, and the garden of the Zoological Society of London in the Regent's Park. In that menagerie the three dogs last named might at one time be seen side by side, affording the best opportunities for comparison. Peter, the Esquimaux dog, kept in the garden, was of a dingy white with a tinge of yellow on the upper parts, gradually fading away upon the sides; in short, of nearly a uniform colour, but in general this race exhibits a predominance of black markings. Thus Akshelli brought from the Polar sea by Mr. Richards in Captain Parry's first voyage, and described by Mr. Children in the Zoological Journal, was almost entirely blackish, or of a colour nearly approaching to black on the upper parts, and white underneath, tail included. Akshelli seldom barked, but, if displeased, uttered a low wolfish growl, and

was a very powerful dog. Peter was brought to this country by Lieut. Henderson, one of the companions of Captain Ross, in his first voyage, and lived long at the Regent's Park. He was very good tempered and familiar. The Hare-Indian dogs, it is said, are never known to bark in their own country, and it is worthy of note that those which were brought from thence to the Regent's Park never barked at all, but the younger one which was born here barked like the other dogs. It is curious to observe these steps. 'The period,' says Mr. Bell, 'at which the domestication of the dog first took place is wholly lost in the mist of antiquity. The earliest mention of it in the sacred Scripture occurs during the sojourn of the Israelites in Egypt.—"But against Israel shall not a dog move his tongue." It is again mentioned in the Mosaic law in a manner which would seem to show that they were the common scavengers of the Israelitish camp, as they are still in many of the cities of the East:—"Neither shall ye eat any flesh that is torn of beasts in the field: ye shall cast it to the dogs." A similar office seems to be repeatedly alluded to in the course of the Jewish history:—"Him that dieth in the city shall the dogs eat, and him that dieth in the fields shall the fowls of the air eat;" a common curse, as it would appear, as it occurs verbatim on no less than three separate occasions in the First Book of Kings; and evidently intimates a violent and disgraceful death, without the honour of sepulture. The dog was considered by the Jews as eminently an unclean animal, and was the figure selected for the most contemptuous insults. It is impossible not to be struck with the striking similarity which exists in the feelings of many oriental nations at the present day, among whom the very phraseology of the Scriptures is, with little modification, applied to a similar purpose.

Before we proceed to give a sketch—and our limits will allow us to give no more—of the varieties of the dog as fostered by man, we must say another word as to its origin. The student should be on his guard against being led to a conclusion as to that origin by any particular developments of parts. No animal seems to be more susceptible of modification than the dog, and man has succeeded in producing almost every degree of change in the form of its cranium, its stature, its aspect, and its fur. With regard to the latter it is, in some varieties, almost entirely absent, and we have seen, on the other hand, good close *wool* from a curious variety of the poodle.

One circumstance should be borne in mind throughout an inquiry into the origin of the dog. None of the wild dogs, however, apparently living in a state of nature, have ever been found to return to the true form of wolf.

The shepherd's dog, a variety which was most probably one of the first that civilized and settled man called in aid to preserve his flocks from beasts and birds of prey and the depredations of roving human tribes, is remarkable for the capacity of its cranium and its great sagacity.

Skull of Shepherd's Dog, Chien de Berger; from F. Cuvier.

It is indeed distinguished by this cranial development even above the spaniels and their varieties, and the hounds

Skull of Spaniel; from F. Cuvier.

which comprise the most useful and intelligent dogs. In the bull-dogs and mastiffs, 'dogues de forte race,' of the French, though the head is one-third larger than those of the shepherd's dog and of the spaniels, 'Barbets,' the cranial capacity is not by any means so great.

Skull of Dogue de forte race; from F. Cuvier.

Dr. Caus, the physician of queen Elizabeth's time, wrote several papers on Natural History for the use of Gesner his correspondent and friend. In one of these treatises he divides the British dogs into—1st. *The most generous kinds*, which he subdivides into the *dogs of chase*, including the *Hounds*, viz., the *Terrier*, *Harrier*, and *Bloodhound*; and the *Gazehound*, *Greyhound*, *Leviner*, or *Lyemmer*, and *Tumbler*:—*The Fowlers*, viz. the *Spaniel*, *Setter*, *Water-spaniel*, or *Finder*—and the *Lap Dogs*, viz. the *Spaniel Gentle*, or *Comforter*. 2nd. *The Farm-Dogs*, viz. the

Shepherd's Dog, and the *Mastiff*, or *Ban-dog*. 3rd. *Mon-grels*, viz. *Wappe*, *Turnspit*, and *Dancer*.

Bewick enumerates the following:—The *Shepherd's Dog*, the *Cur Dog*, the *Greenland Dog*, the *Bull-dog*, the *Mastiff*, the *Ban-dog*, the *Dalmatian*, or *Coach-dog*, the *Irish Greyhound*, the *Highland Greyhound*, the *Gazehound*, the *Greyhound*, the *Italian Greyhound*, the *Lyemmer*, the *Lurcher*, the *Tumbler*, the *Terrier*, the *Beagle*, the *Harrier*, the *Foxhound*, the *Old English Hound*, the *Kibble Hound*, the *Blood Hound*, the *Spanish Pointer*, the *English Setter*, the *Newfoundland Dog*, the *Rough Water Dog*, the *Large Water Spaniel*, the *Small Water Spaniel*, the *Springer*, or *Cocker*, *King Charles's Dog*, the *Pyrame Dog*, the *Shock Dog*, the *Lion Dog* (a small and rare variety), the *Comforter* (a small spaniel), the *Turnspit*, and the *Pug*. We could add many more to this list, which is long enough. The French divide the dogs into three groups, viz., the *Mâtins*, the *Spaniels* (including the *Hounds* and *Pointer*), and the *Dogues* (the last containing the *Mastiff*, *Bull-dog*, &c.)

Skull of Chien Matin.

We give the gigantic *Thibet Dog* as a fine example of the *Mastiffs*. Dr. Wallich gave to Mr. Broderip the data which

The Thibet Dog, *Canis familiaris*, var. *Molossus Thibetanus*.

enabled the latter to write the following account for the late lamented Mr. Bennett. 'These noble animals are the watch-dogs of the table-land of the Himalaya mountains, about Thibet. Their masters, the *Bhoteas*, to whom they are most strongly attached, are a singular race, of a ruddy copper colour, indicating the bracing air which they breathe, rather short, but of excellent disposition. Their clothing is adapted to the cold climate they inhabit, and consists of fur and woollen cloth. The men till the ground and keep sheep, and at certain seasons come down to trade, bringing borax, tinsel, and musk, for sale. They sometimes pene-

trate as far as Calcutta. On these occasions the women remain at home with the dogs, and the encampment is watched by the latter, which have an almost irreconcilable aversion to Europeans, and in general fly ferociously at a white face. A warmer climate relaxes all their energies, and they dwindle even in the valley of Nepal.' Those which were in the Zoological Society's Garden in the Regent's Park died soon after their arrival. They were considered very great rarities, and were brought over to this country by Dr. Wallich. The Hon. Edward Gardner, British resident at the court of the Rajah of Nepal, never heard of any other instance of this variety being domesticated by Europeans.

In all the varieties the period of gestation is sixty-three days. The litter is generally numerous, often as many as eight or nine. The whelps are born blind, and do not see till nine days are fully expired: they sometimes see on the tenth, and sometimes not till the twelfth day. At the fourth month the teeth begin to change, and at two years the growth of the animal is considered complete. A dog is considered old at the expiration of five years, and the limits of his existence rarely exceed twenty years.

It is confidently stated that in all the varieties, if a dog has any white on any part of his tail, that colour will invariably be found at the tip.

Those who would pursue their inquiries as to the varieties of breeds of dogs, should refer to *The Sportsman's Cabinet* (two quarto volumes entirely devoted to the subject, and beautifully illustrated); *Daniel's Rural Sports*; the chapter on 'Dogs' in *The Menageries* (*Library of Entertaining Knowledge*); and Sir John Sebright's interesting and well-digested little book, in addition to the works referred to in this article.

Fossil Dogs.

It may be doubted whether any fossil remains of the Dog, properly so called, have ever been found. The occurrence of the bones of the wolf and the fox in the ossiferous caverns, &c., is well known; but in pursuing this part of the inquiry it should be remembered how difficult it is to distinguish the bones of the wolf from those of the *mâtin*, as Cuvier observes, and the *Shepherd's Dog*. The *Canis Spelæus* of Goldfuss, the remains of which were found at Gailenreuth, bears the strongest resemblance in the form of the cranium generally to the wolf, but the muzzle is shorter and the palate is wider. The *Agnotherium* of Kaup is described by him to have been as large as a lion, and to be allied to the dog.

DOGE was the title of the first magistrate of the republic of Venice. The first settlers on the islands of the lagune were governed by magistrates sent from Padua. After Padua was devastated by the Huns and other barbarians, A. D. 452-60, the colonists of the lagune being left to themselves, each island elected a magistrate called tribune. An annual selection was made of seven from among these tribunes, who constituted the government of the whole community. A council of forty persons chosen by the general assembly of the people had the legislative and judicial powers. As population and wealth increased, and the community was threatened by hostile neighbours, it was found necessary to concentrate and strengthen the executive, and a chief magistrate for life was elected by the assembly of the people, and was called doge, a corruption of dux, as he was also general of the armed force. The first doge, Paolo Luca Anafesto, was elected in 697. The third doge in succession, Orso Ippato, elected in 724, made war against the Longobards, and took Ravenna, which he restored to the Byzantine emperor, who, as a reward for this service, granted to the republic a tract on the coast of the mainland as far south as the Adige. This first continental possession of Venice, being afterwards enlarged, was called Dogado. The successes of Orso inspired the people with jealousy, and he was assassinated in 737. The office of doge was at the same time abrogated, and an annual magistrate was substituted, but the fifth of these was imprisoned on some charge, and his eyes were put out, after which the people again elected a doge for life in 742. From that time till 1172 about forty doges ruled in succession, nearly one half of whom died a violent death or were deposed, exiled, or had their eyes put out, sometimes by regular trial before the council of forty, and sometimes by popular insurrection. The Quarantia, or Council of Forty, which exercised the government during the interregna, assumed by degrees the

power of electing a doge in order to put a stop to the frequently recurring tumult and anarchy, the choice however was subject to confirmation by the assembly of the people. The first doge thus elected was Sebastiano Ziani in 1172, and the Forty made him swear to a new constitution, or fundamental law, by which, instead of the general assembly of the people, the sovereign power was vested in a great council of 470 citizens, elected for one year, but capable of indefinite re-election. These were chosen by twelve electors, two for each sestiere, or district, of the city of Venice alone, who were themselves appointed by the inhabitants of their respective districts, the other islands and territories of the republic having no part in the elections. The Great Council was to appoint six individuals who were to be the doge's counsellors, without whose concurrence no act of the doge should be valid. This council was afterwards called 'la Signoria.' In important cases the doge was to consult with another council of sixty members, called Pregadi, or 'requested,' taken also from the Great Council. This is the body which in course of time became invested with all the powers of the state, and is generally known by the name of the Venetian Senata. The citizens of Venice, weary of tumult, and being secured in the exclusive right of furnishing the members of the Great or Sovereign Council, seem to have willingly acquiesced in these constitutional changes, and a distribution of golden pieces made by the new doge served to gratify the populace. About a century after, another organic change took place. Pietro Gradenigo being elected doge in 1289, by the influence of the old or aristocratic families, proposed a law which passed the Great Council in 1298 after much opposition and delays, that no one should in future be eligible to sit in that assembly except those who then had a seat in it, or whose fathers, grandfathers, and great-grandfathers, had been members of it. The number of the members of the Great Council was no longer limited to 470. Lastly, in 1319 a new law passed the Great Council, by which that assembly declared itself permanent and hereditary, all the members who were then sitting in it (about 600 in number) remaining for life in possession of their seats, their sons who were above twenty-five years of age being likewise admitted, and their descendants after them, to the exclusion of all other families. This decree, known in history as 'la serrata del maggior consiglio,' established an hereditary and exclusive aristocracy at Venice, which lasted till the end of that republic. The confirmation of the doge by the people was henceforth dispensed with. The doge himself became merely a state pageant, the servant of the councils, which had the power of trying and deposing him, and even sentencing him to death. They took away from him the command of the military and naval forces, his children were excluded from every office of state, and he had no patronage except the prebendal stalls of the cathedral of St. Mark. The doge was president by right of all the councils, with a double, or casting vote. He was simply addressed by the title of Messer Doge. (*Memori Venete* di Giovanni Galliccioli, Venice, 1826; Daru, *Histoire de Venise*, books 6 and 39; and an article in the *Edinburgh Review*, No. 91, June, 1827.)

The doges at Genoa were at first magistrates for life [*BOCCANERA*], as at Venice, but the frequent contentions and civil factions among the aspirants to that dignity induced Andrea Doria, in his reform of 1528, to make the office of doge to last only two years. [*DORIA*]

DOGGERBANK, a very extensive sand-bank in the North Sea, lying between the east coast of England and the west coast of Holland, and situated between the Well-bank and the Broad-fourteen. The western part of the Dogger-bank is about twelve leagues east from Flamborough head, in the east riding of Yorkshire, whence the bank extends in a direction nearly E.N.E. to within twenty leagues of Jutland. In some places this bank is twenty leagues broad, but it is contracted towards the east, and terminates nearly in a point. The shoalest part is that nearest the English coast, where it has nine fathoms water, so that it presents no dangers or difficulties to navigators; in other parts the surface rises generally towards the centre: in some places the depth of water is as great as twenty-seven fathoms.

The Doggerbank is a noted station for the cod-fishery, and is much frequented by both English and Dutch fishermen. It is also known in history as the scene of an obstinate naval engagement which took place in the summer of 1781 between the English and Dutch fleets under the respective

commands of Admirals Parker and Zoutman. The disabled condition of the ships on both sides put an end to the battle, in which neither side could claim a victory.

DOGMA (*δῶγμα*), a word borrowed from the Greek, means an established principle, a fundamental article of belief derived from undisputed authority, and is generally applied to the essential doctrines of Christianity which are drawn from the Scriptures, or from the authority of the Fathers. Hence that branch of divinity called dogmatic theology is an exposition and assertion of the various articles of the Christian faith as founded upon authority acknowledged by Christians in general, and is distinguished from scholastic theology, which assumes to establish the truth of the Christian doctrines by argument. John Damascenus was one of the first who wrote an exposition of Christian dogmatics. [*DAMASCENUS*.] But although the authority of the Scriptures and of the early fathers is acknowledged by all Christians, there are other authorities which are acknowledged only by one communion, and not by others. Thus the Greek church acknowledges the authority of the earlier councils only, while the Roman Catholics look upon the later councils and the bulls and decretals of the Popes as equally positive authority in matters of faith; and the Protestant and reformed churches, rejecting the latter, recur to their respective Synods and confessions of faith. Melancthon wrote a concise exposition of the dogmas of the Protestant or Lutheran church. Among the numerous Roman Catholic writers on dogmatic theology, Bellarmine is one of the most distinguished. Dogmatic theology, as distinct from scholastic as well as from moral theology and Biblical divinity, constitutes a separate chair in several Roman Catholic universities in continental Europe.

In the Protestant Universities of Germany there is a chair for the history of dogmas. The business of the professor is to examine the doctrines of the various sects which have divided Christianity, their sources, and the arguments by which they are supported. Such a course of lectures forms an important addition to the study of Ecclesiastical History.

DOG'S-BANE, the English name of the poisonous plant called by botanists Apocynum.

DOG'S-TAIL GRASS. [*CYNOSURUS*.]

DOGWOOD, the English name of various deciduous-leaved shrubs belonging to the genus *Cornus*. [*CORNACEÆ*.] They are cultivated as ornamental plants, for the sake of their bright red shoots, which are an embellishment of plantations in the winter; and also for the sake of the charcoal obtained from them, which is one of the best sorts for the manufacture of gunpowder.

DOIT or DUYT, a small Dutch copper coin, being the eighth part of a stiver, in value half a farthing. Doit is also a division of the English grain Troy. See Snelling's 'View of the Coins of Europe,' 8vo. London: 1766. Kelly's 'Complete Cambist,' i. 219; ii. 278. The word is used by Shakespeare, *Coriolanus*, act. i., sc. 5.

DOL. [*ILLE ET VILAINÉ*.]

DOLABELLA. (Malacology.) [*TECTIBRANCHIATA*.]

DOLABRIFORM, a term applied in botany to certain fleshy leaves, which are straight at the front, taper at the base, compressed, dilated, rounded, and thinned away at the upper end at the back, so as to bear some resemblance to an old fashioned axe-head.

DOLCI, CARLO, an excellent painter, was born at Florence, on Thursday, May 25, 1616. His father Andrew, and his mother's father and brother, Pietro and Bartolomeo Marinari, were all painters, and much esteemed and respected in their native city. At the age of four years Carlo had the misfortune to lose his father, and his mother was obliged to maintain a numerous family by her industry. At the age of nine she placed him with Jacopo Vignali, a pupil of Roselli, who was famous for his powers of teaching. In four years Carlo could paint. His first efforts attracted the notice of Piero de' Medici, an amateur who procured him the notice of the court, and he soon became very busily and profitably employed. In 1654, by the advice of his friends, he married Theresa Bucherelli, by whom he had a numerous family. About 1670 he was invited to paint the likeness of Claudia, the daughter of Ferdinand of Austria, at Innspruck, which place he visited for a short time. After his return he was afflicted with melancholy, and he died on Friday, January 17, 1686, leaving one son in holy orders, and seven daughters, of whom

Agnese, married to Carlo Bacì, a silk merchant, painted in the manner of her father.

Dolci's biographer, Baldinucci, attributes his excellence in painting to the goodness of Heaven, as a just reward for his singular piety, in illustration of which numerous anecdotes are told. When invited to take Claudia's portrait, he declined for fear of the length of the journey, never having lost sight of the cathedral dome and campanile of his favourite city since his birth; and his assent was only procured by obtaining the commands of his confessor, which he obeyed at once. In like manner he was recovered from his first fit of melancholy by the command of his confessor to proceed with a picture of the Virgin. He appears to have been extremely good and amiable, but singularly timid. His last illness was brought on by a remark which Luca Giordano uttered in joke, according to his intimate friend Baldinucci, that his slowness would never allow him to amass 150,000 dollars as the expeditious Giordano had done, but that he must starve. Upon this, poor Carlo seems to have grown bewildered; he decried the works of the other, whom he thought to be taking the bread out of his mouth, and refused food for some time. In the midst of his troubles, his excellent and beloved wife died, and death soon released him from his grief. In all his insanity he was never violent, but dejected and helpless, and as obedient as a child to his ghostly adviser.

From his first attempts at painting, Carlo determined to paint none but sacred subjects, and he almost literally observed this rule. His style is pleasing, and full of gentle and tender expressions; his drawing for the most part, but not always, correct; his colouring varied, soft, bright, and harmonious; sometimes too pearly in its tint. Lanzi traces in his painting something of the manner of Rosselli, who was, as it were, his grandfather in art. He elaborated all he did with the most consummate patience and delicacy. His pictures are numerous, and found in many collections, for he painted many duplicates, and many copies were made by his pupils Alessandro Lomi and Bartolomeo Mancini, and Agnese, his daughter. Onorio Marinari, his cousin and scholar, gave great promise, but died young. (Baldinucci.)

DOLCIGNO, or **DULCIGNO**, in the Albanian tongue **DULTZUNE**, and in the Turkish **OLGUN**, a town in Upper Albania, near Scutari. [ALBANIA.] This town is on the coast, and has a good harbour. The inhabitants, who amount to about 6000, are engaged partly in commerce, but chiefly in piracy. They were regarded till of late as the most formidable pirates of the Gulf of Venice. Some of their seamen enter into the service of the Barbary States. This town, or perhaps Dulcigno Vecchie, which Mr. Hobhouse (in the map prefixed to his *Travels*) places on the coast, five or six miles more to the north, was antiently called *Olcinium*, a name containing the same elements as the modern Albanian and Turkish names; the Illyrians of *Olcinium* followed the same piratical course as the modern Dulcignotes. (Hobhouse, *Travels in Albania*.)

DOLÉ, a town in France, in the department of Jura, on the north-west bank of the Doubs, a feeder of the Saône, and on the road from Paris to Geneva. It is about 190 miles in a straight line south-east of Paris, in 47° 7' N. lat. and 5° 28' E. long.

Dole is not clearly identified with any Roman site; but in the town and its environs vestiges of the Romans have been traced. In the middle ages, while Besançon was yet a municipal republic, Dole was considered as the capital of La Comté de Bourgogne, or La Franche Comté. It was taken and almost destroyed by the French in 1479. It was again attacked by the French, under the Prince of Condé, in 1536. In 1668, La Franche Comté having been conquered by the French, the ramparts of Dole were razed, but repaired by the Spaniards, to whom the town was restored by a treaty of peace the same year. At a subsequent period, after La Franche Comté had come finally into the hands of the French, they were finally demolished.

The town is pleasantly situated, but its streets are steep, and the houses poor and irregularly built. The church of Notre Dame is worthy of notice, and there is a pleasant promenade. The population, in 1832, was 7304 for the town, or 9927 for the whole commune. The inhabitants carry on a trade in corn, wood, and iron; they manufacture hosiery and glass. There are iron-works and coal-mines in or near the town.

There are a library, a high school, an agricultural society, and a theatre. There is also a prison at Dole.

Dole is the capital of an arrondissement, which had in 1832 a population of 72,992.

DOLGELLY. [MERIONETHSHIRE.]

DOLICHONYX. [BOB-O-LINK; EMBERIZIDÆ.]

DOLICHOS. Under this name Linnaeus included the greater part of those tropical twining leguminous plants which bear eatable fruit like the kidney-beans cultivated in Europe. A large number of species, ill distinguished from each other, and differing materially in the structure of their fructification, were for so long a time collected under this name that, although they are now broken up into several genera, we shall briefly notice the more remarkable in this place.

Dolichos itself is confined to the species with a compressed linear pod, having incomplete cellular dissepiments and ovate seeds with a small oval hilum. Of these *D. Catjang*, the pulse of which is called Boberloo in India, is an annual, and has somewhat deltoid leaves angular at the back, few-flowered peduncles, and erect pods; it is cultivated in the fields in many parts of India during the dry season, and its seeds are extensively consumed by the poorer natives. *D. lignosus*, a perennial, with long racemes of flowers, broad heart-shaped leaflets, and linear sharp-pointed pods, is extremely common all over India, where it is cultivated 'during the cold season in gardens and about the doors of the natives, forming not only cool shady arbours, but furnishing them with an excellent pulse for their curries,' &c. There are several varieties of it constituting the commonest kidney-beans of India. *D. biflorus*, an annual, with oblong pointed leaflets and scimitar-shaped hairy pods, furnishes the pulse called in India horse-gram; and *D. sphaerospermus* produces the Calavana or black-eyed peas of Jamaica.

Labiab has a compressed scimitar-shaped pod, rough with tubercles at the sutures, and furnished with transverse imperfect cellular partitions, and ovate seeds with a fungous callous linear scar. *Labiab vulgaris*, the old *Dolichos Labiab*, is a common plant in the hedges in many parts of India, whence it has travelled into the tropical parts of America. It is a smooth perennial with showy white or purple flowers, and large horizontal pods, containing from three to four seeds. It has a heavy disagreeable bug-like smell, prefers a rich black soil that cannot be flooded by rains, and produces a coarse but wholesome pulse, much eaten by the lower classes in India.

Pachyrhizus has a long compressed pod, with kidney-shaped seeds and no dissepiments, and is remarkable for its principal species, *P. angulatus* (formerly *Dolichos bulbosus*), producing a root of the size and substance of a turnip. It is reported to have been carried to the Philippines from South America, and thence to have been introduced into the west of Asia. The side leaflets are nearly triangular, that in the middle lozenge-shaped, slightly toothed, and shaggy on both sides. The flowers are very beautiful, of a violet blue colour, and arranged in axillary nearly erect racemes, from one to two feet long. Its root is a common article of food in the Malay archipelago, but no other part of the plant is eaten.

In *Psophocarpus* the pods are oblong, and have four longitudinal wings; the seeds are roundish. It comprehends the *Dolichos tetragonolobus*, a twining annual, the pods or tuberous roots of which are a common Indian esculent.

Canavalia, with long straightish compressed pods, having three short wings at the lower suture, cellular dissepiments, and oblong seeds with a narrow hilum, comprehends the South American Lima beans and the Sword beans of India. The species have a handsomer and firmer foliage than the other genera, and the flowers are usually large and showy. *C. gladiata*, the common cultivated species, has often pods as much as two feet long, and varies with red, grey, and white seeds.

Finally, the genus *Mucuna*, known by its oblong puckered compressed hispid pods, includes all the species from which Cowhage is obtained. [COWHAGE or COWITCH.]

DOLI'OLUM. [DIPHYDES, vol. ix., p. 11.]

DOLIUM. [ENTOMOSTOMATA.]

DOLLAR. [MONEY.]

DOLLOND, JOHN, an eminent optician, was descended from a French refugee family, settled in Spitalfields, and born on the 10th of June, 1706.

His parents were in humble circumstances, his father being an operative silk weaver; and the man who was des

med to add so important a discovery to our knowledge of the laws of light was compelled to spend his boyhood in the drudgery of a manufactory, and in a capacity which had nothing congenial to his tastes. The little leisure however which he had was spent in the acquisition of a varied circle of knowledge. Besides the study of mathematics and physics, to the latter of which his reputation is chiefly due, he studied anatomy and natural history in general, on one hand, and theology and ecclesiastical history on the other. In furtherance of this diversified class of subjects, which, considering the toil to which the day was devoted, was sufficiently extensive, he undertook the Greek and Roman classics; he was partially acquainted with several of the modern languages, but with French, German, and Italian, he was intimately conversant. It is very rare to see the happy union of great powers of reasoning, of memory, and of observation, that was displayed by this eminent man.

Notwithstanding the cares of a family and the duties which it imposed upon him, Dollond still found means to cultivate the sciences; and having apprenticed his eldest son, Peter, to an optical instrument maker, he was in due time able to establish him in business in Vine Court, Spitalfields. In this business he finally joined his son, for the especial purpose, it would seem, of being able to unite his tastes with his business more perfectly than silk weaving enabled him to do.

Immediately on this arrangement being completed, Dollond commenced a series of experiments on the dispersion of light, and other subjects connected with the improvement of optical instruments, and especially of telescopes and microscopes, the results of which were communicated to the Royal Society in a series of papers. Three of them were printed in the *Philosophical Transactions* for 1753, one in 1754, and the last in 1758, the titles of which are given below. It was about 1755 that he entered upon a systematic course of experiments on dispersion, and after, to use his own words, 'a resolute perseverance' for more than a year and a half, he made the decisive experiment which showed the error of Newton's conclusions on this subject. [LIGHT.]

The memoir in which the series of investigations was detailed appeared in the *Philosophical Transactions*, and was the last which he gave to the world. It was rewarded by the council of the Royal Society with the Copley medal.

It was the lot of Dollond to undergo considerable annoyance on account of the claims set up for this discovery in favour of others, especially of Euler; but there is not a shadow of a doubt of Dollond's priority as well as originality, in this very important discovery, left on the minds of the scientific world. The discrepancies which followed the application of Newton's doctrine to the varied cases that presented themselves in the course of different experiments might, in speculative minds, have created a suspicion of the accuracy of that doctrine; yet there does not appear to have been the least hesitation among scientific men in attributing these discrepancies to *errors of observation exclusively*, and consequently not the least ground for honestly attempting to deprive Dollond of the honour of the discovery.

In the beginning of the year 1761 Dollond was elected a Fellow of the Royal Society, and appointed optician to the king. He did not long survive to enjoy the honour or advantages of his discoveries; as, on the 30th of September of that year, he was attacked by a fit of apoplexy, brought on by a too close and long continued application to a paper which he was studying. This attack immediately deprived him of speech, and in a few hours of life itself.

Besides his eldest son Peter, already mentioned, he left another son and three daughters. The two sons carried on the business jointly with great reputation and success; and upon the death of the younger, it went into the hands of a nephew, who took the family name, and who still carries it on without diminution of the high character attached to the name of Dollond.

Mr. Dollond's appearance was somewhat stern, and his address and language impressive; but his manners were cheerful, kind, and affable. He adhered to the religious doctrines of his father, and regularly attended the French Protestant Church, of which his life and conversation rendered him a bright ornament.

The following is the list of Dollond's published papers:—
1. A letter to Mr. James Short, F.R.S., concerning an
P.C., No. 539

Improvement in Reflecting Telescopes; *Phil. Trans.*, 1753, p. 103

2. Letter to James Short, A.M., F.R.S., concerning a mistake in Mr. Euler's Theorem for correcting the Aberration in the Object Glasses of Refracting Telescopes; *Phil. Trans.*, 1753, p. 287.

3. A description of a Contrivance for measuring Small Angles; *Phil. Trans.*, 1753, p. 178.

4. An Explanation of an Instrument for measuring Small Angles; *Phil. Trans.*, 1754, p. 551.

5. An account of some experiments concerning the different Refrangibility of Light; *Phil. Trans.*, 1758, p. 733.

DOLOMIEU, DEODAT-GUY-SILVAIN TANCREDE DE, was born at Grenoble on the 24th of June, 1750. In early youth he was admitted a member of the religious order of Malta, but in consequence of a quarrel with one of his companions, which ended in a duel fatal to his adversary, he received sentence of death, but, after imprisonment, he was pardoned, and went to France. After some hesitation whether he should devote himself to classical literature or to natural history, he decided in favour of the latter. While at Metz with the regiment of carbiniers, in which he had obtained a commission, he formed an acquaintance with the celebrated and unfortunate La Rochefoucault, which ceased but with his existence; and the attachment for science, by which this nobleman was distinguished probably contributed to confirm Dolomieu in the choice of the pursuit which he had previously made. He was soon afterwards elected a corresponding member of the Academy of Sciences, and quitted the military profession.

At the age of twenty-six he went to Sicily, and his first labour was an examination of the environs and strata of *Ætna*. He next visited Vesuvius, the Appenines, and the Alps, and in 1783 published an account of his visit to the Lipari islands.

He returned to France at the commencement of the Revolution, and early ranged himself on the side of liberty. He had however no public employment until the third year of the republic, when he was included in the *École de Mines*, then established; and he was one of the original members of the National Institute, founded about the same time. He was indefatigable in the pursuit of geological and mineralogical science, and in less than three years he published twenty-seven original memoirs; among which were those on the nature of *leucite*, *peridot*, *anthracite*, *pyroxene*, &c.

When Bonaparte undertook the conquest of Egypt, Dolomieu accompanied the expedition; on the arrival of which he visited Alexandria, the Delta, Cairo, the Pyramids, and a part of the mountains which bound the valley of the Nile. He proposed also to explore the more interesting parts of the country; but before he could carry his plan into execution his health became so deranged that he was compelled to return to Europe. On his passage home he was, with his friend Cordier, the mineralogist, and many others of his countrymen, made prisoner after being driven into the Gulf of Tarentum, and confined in a miserable dungeon. His companions were soon set at liberty, but the remembrance of the disputes which had existed between him and the members of the Order of Malta led to his removal and subsequent imprisonment at Messina, where he was confined in a dungeon lighted only by one small opening, which, with barbarous precaution, was closely shut every night. The heat, and the small quantity of fresh air admitted by the window of his prison, compelled him to spend nearly the whole of his time in fanning himself with the few tattered remnants of his clothes, in order to increase the circulation of the air.

Great exertion and urgent demands were made by the scientific men of various countries to obtain his enlargement; and when, after the battle of Marengo, peace was made with Naples, the first article of the treaty was a stipulation for the immediate release of Dolomieu. On the death of Daubenton he was appointed professor of mineralogy, and soon after his return to France he delivered a course of lectures on the philosophy of mineralogy at the Museum of Natural History.

In a short time he again quitted Paris, visited the Alps, and returned to Lyon by Lucerne, the glaciers of Grindelwald and Geneva, and from thence to Châteaufort, to visit his sister and his brother-in-law De Drée: here he was unfortunately attacked by a disorder which proved fatal in the 53rd year of his age.

He had projected two journeys for adding to his vast store

of geological knowledge, the first through Germany, and the second through Norway, Denmark, and Sweden. He also proposed to publish a work which he had planned in his prison at Messina; of this he printed a fragment on *Mineral Species*, which is a monument at once of his misfortunes and his genius, being written in his dungeon in Sicily, on the margin of a few books with a bone sharpened against his prison walls for a pen, and the black of his lamp smoke mixed with water for ink. In this work the author proposes that the integral molecule shall be regarded as the principle by which the species is to be determined, and that no other specific characters should be admitted than those which result from the composition or form of the integral molecule. It must however be admitted as an objection to this proposal that the integral molecule is not always easily ascertained or characterized.

'From a careful perusal of the works of Dolomieu,' observes Dr. Thomson, *Annals of Philosophy*, vol. xii., p. 166, 'especially his later ones, the following appear to be the results of his observations and the bases of his geological system :

'It appears highly probable, from geometrical considerations and from the theory of central forces, that the earth at the time when it received its spheroidal shape was in a state of fluidity. This fluidity was probably neither the result of igneous fusion nor of aqueous solution, but of the intermixture of a substance or substances with the earthy particles fusible, like sulphur, at a moderate heat, capable of entering into more rapid combustion when exposed to the air, decomposing water, and involving the gas thus produced so as to enter into strong effervescence when the superincumbent pressure does not exceed a given quantity.

'The surface of this fluid, by the action of the air on the combustible ingredient which occasioned its fluidity, would at length become consolidated, and would envelop the whole spheroid with a shell of less specific gravity than the fluid part, and therefore floating securely on its surface; this latter essential condition being rendered extremely probable from the well-known fact, that the mean specific gravity of the globe is considerably greater than that of any natural rock hitherto known.

'The interposition of this solid shell of stony matter, a bad conductor of heat, between the liquid and gaseous portions of the globe, would enable the aqueous and other easily-condensable vapours to separate themselves from the permanently-elastic gases, and thus the matter of the globe would be arranged in four concentric spheroids according to their respective gravities: namely, the liquid central portion, the solid stony, the liquid aqueous, and the permanently elastic. As the water penetrated through the stony portion to the nearest fluid part, it would be gradually decomposed, the consolidation would proceed downwards, the newly consolidated part would enlarge in bulk, and thus, aided by the elastic expansion of the hydrogenous base of the decomposed water, would occasion rifts of greater or less magnitude in the superincumbent mass. Some of the larger of these rifts would open a free communication between the ocean and the fluid central mass, a torrent of water would rush down, and the effervescence occasioned by its decomposition would produce the first submarine volcanoes. The lava thus ejected would in time raise the mouth of the volcano above the surface of the water, when it would either become quiescent, or, if supplied laterally with a sufficient quantity of water, would assume the character of a proper volcano, or burning mountain. The secondary rocks, i.e. all those which either themselves contain organic remains or are associated with those which do, were deposited from solution or suspension in water. By the deposition of these, and the increase by consolidation of the primitive rocks, the thickness of the mass incumbent above the central fluid is continually increasing; and those causes which antiently broke through the solid crust of the globe are now rarely able to produce the same effect; hence the greater magnitude and frequency of volcanic eruptions in the earliest ages of the earth; for the same reason the elevation of large mountainous or continental tracts above the general level no longer takes place; and thus the surface of the globe has become a safe and proper habitation for man and other animals. If the land animals were created as early as possible, that is, while the great changes of the earth's surface above-mentioned were still in process, many of the most antient traditions of deluges and other catastrophes may be founded on fact.

'The fluidity of the central part of the globe, and its connection with the active volcanoes, affords a plausible theory of earthquakes, and particularly accounts for the propagation of the shock, with diminishing intensity, to great distances.

'The crystals of hornblende, of felspar, &c., which occur so abundantly in most lavas, are, according to this theory, not those component ingredients of rocks which have resisted the heat while the other substances associated with them have been melted; nor are they the result of the slow cooling of a vitreous mass, but are produced by crystallization in the central fluid, and are accumulated, on account of their inferior specific gravity, about its surface, together with the peculiar inflammable matter in which they float, whence they are disengaged during volcanic eruptions.

DOLOMITE, a variety of magnesian limestone first noticed by Dolomieu. It occurs mostly massive, and in mountain masses; it is usually white, sometimes greyish or yellowish; its structure is sometimes slaty; it is frequently translucent on the edges. It is softer than common limestone.

The Apennines are partly composed of dolomite, and it occurs at Iona. Sometimes it is met with in veins accompanied by quartz, carbonate of lime, &c. The dolomite of the Apennines consists of 59 carbonate of lime and 40 carbonate of magnesia: it contains a variable quantity of oxide of iron.

Compact Dolomite or Gurhoffian is snow white, and very compact. The surface, when newly broken, is scarcely shining, and the fragments, which are sharp, are translucent on the edges; the fracture is flat conchoidal, and its hardness is considerable. It occurs in veins traversing serpentine between Gurhoff (whence its name) and Aggsbach, in Lower Austria. According to Klaproth, it consists of carbonate of lime 70.50, and carbonate of magnesia 29.50.

DOLPHIN. [WHALES.]

DOMBES, a principality in France, to the east of the river Saône; one of the divisions existing before the Revolution. It consisted of two portions separated from each other by an intervening part of the district of Bresse by which the eastern portion was entirely surrounded. The western portion was bounded on the west by Lyonnaise, Beaujolais, and Maconnais, from which it was separated by the river Saône; on the south, by the districts of Franco-Lyonnaise and Bresse; and on the north and east by Bresse. It is now comprehended in the department of the Ain. It contained seven towns, among which were Trévoux, the capital, and Thoissey. Dombes was governed by sovereign princes of its own, who derived a considerable revenue from it, until the year 1762, when the reigning prince exchanged his principality for the duchy of Gisors in Normandy, and other lands. Dombes was united to the crown; but retained its 'parlement,' or local civil court.

DO'MBEYA, a name given by botanists to a Sterculiaceae genus of shrubs or trees inhabiting the East Indies and the Isles of France, Bourbon, and Madagascar. They have a five-parted persistent calyx, surrounded by a three-leaved unilateral involucre. The petals are five. The stamens are from fifteen to twenty, scarcely monadelphous, five of them being sterile, with from two to three fertile ones between each sterile stamen. The name Dombeya was also applied to the plant now called *Arumcraia excelsa*.

DO ME. The mathematical theory of a dome, so far as considerations requisite for security are concerned, is more

simple than that of an arch. Imagine two vertical planes passing through the axis of a dome, and making a small angle with each other. These planes intercept (as in the cut) two symmetrically opposite slices of the dome, which tend to support each other at the crown. This support might be made complete and effectual upon principles explained in the article *ARCH*; so that in fact each small slice of the dome, with its opposite, might compose a balanced arch. Any slice of such a dome is supported by the opposite one only, so that all the rest might be taken away. Now suppose such a dome to be constructed upon an interior centering, of which however the arches are not separately balanced, in consequence of the weight of A P K being so great that the resultant of this weight and the horizontal thrust at A falls obliquely, not being, as in a balanced arch, perpendicular to P K, but cutting the line K P produced towards the axis. Still this dome cannot fall: for since every part of the horizontal course of stones has the same tendency to fall inwards, these pressures inwards cannot produce any effect, except a lateral pressure of each slice upon the two which are vertically contiguous. Hence the condition of equilibrium of a dome is simply this, that the weight of any portion A M P K must be too great for a balanced arch. Upon this same principle a dome may even be constructed with a concave exterior: and in a dome of convex exterior a portion of the crown may be removed, as is the case when the building is surmounted by a lantern. The tendency of the upper part to fall inwards being equal all round, each stone is supported by those adjacent.

From the preceding it appears that it would be (in comparison with an arch) easy to construct a dome with perfectly polished stones, and without cement. The friction of the stones and the tenacity of the cements are of course additional securities. The part in which the construction is weakest will be near the base, more particularly if the joints become nearly horizontal at the base, or if the circumference at the base be very considerable. This weak point is generally secured in practice by bringing strong chains or hoops round the horizontal courses at the interior of the base. Dr. Robison says 'The immense addition of strength which may be derived from hooping largely compensates for all defects; and there are hardly any bounds to the extent to which a very thin dome vaulting may be carried when it is hooped or framed in the direction of the horizontal courses.' This system of internal hooping is every way preferable to reliance upon cements, and may, without interference with the ornamental part of the design, be carried to any length. Among other advantages, a dome may be made by means of it to rise vertically from the base, which cannot be the case in an arch.

The thickness of a dome should increase towards the base. A perfectly spherical dome, that is, a segment of a hollow shell cut off by a plane, and therefore of uniform thickness, will stand securely if the arch of the generating circle subtend at the centre less than $51^\circ 49'$. The law of the thickness necessary to secure equilibrium is as follows:

Let the dome be formed by the revolution of A V and B W, and let P K, the joint of one of the stones, be always perpendicular to the interior curve; which is usually the case in practice. Let $AM = x$, $MP = y$, $PK = z$, arc $BP = s$; and let p be any constant greater than unity, and A any constant whatever. Then there will be equilibrium, the equation of B P W being given, if

$$x = \frac{Ap}{y} \left(\frac{dx}{dy} \right)^{p-1} \cdot \frac{d}{ds} \frac{dx}{dy}$$

or e being the angle K G B, and ρ the radius of curvature at P

$$x = \frac{Ap (\tan e)^{p-1}}{py \cos^2 e}$$

For the demonstration of this formula, see Venturoli's *Mechanics* (Creswell's translation), or Robison's *Mechanical Philosophy*. It is not necessary that p should be a constant: a reference to the work first cited will show how to proceed on the supposition that it is a function of x greater than unity.

DOMÉ, a term applied to a covering of the whole or part of a building. The Germans call it *Dom*, and the Italians *Duomo*, and apply the term to the principal church of a city, although the building may not have any spherical or polygonal dome. From this and other circumstances we may infer the term to be derived from the Latin *Domus*, house.

The remains of antient domes are generally spherical in their form, and built of stone or tufo.

The word dome is applied to the external part of the spherical or polygonal roof, and cupola to the internal part. Cupola is derived from the Italian *cupo*, deep, whence also our word cup. But cupola and dome are often used synonymously, although perhaps incorrectly.

Ruins of numerous domes still exist in the neighbourhood of Rome and Naples. The principal in and near Rome are the Pantheon and the temples of Bacchus, Vesta, Romulus, Hercules, Cybele, Neptune, and Venus, and also some of the Chambers of the Thermæ.

The most magnificent dome of antiquity is that of the Pantheon, supposed to be a chamber of the great baths of Agrippa. The diameter of the dome internally is 142 ft. 8½ in., with a circular opening at the top in the centre 28 ft. 6 in. in diameter. The height of the dome from the top of the attic is 70 ft. 8 in. Internally it is decorated with five rows of square compartments. Each row is considerably larger than that immediately above it, as they converge towards the top. The large squares, all of which are rather more than 12 feet each way, contain four smaller squares sunk one within the other. It is supposed that these squares were decorated with plates of silver, from some fragments of that metal having been found on them. The opening at the top of the dome was decorated with an ornamented bronze moulding, gilt. The external part of the dome appears also to have been decorated with bands of bronze. Constantius II. removed the silver and bronze with which the building was decorated. The base of the dome externally consists of a large plinth with six smaller plinths or steps above it; and in the curve of the dome a flight of steps is formed which leads to the opening at the top of the dome. From the drawings of the architect Serlio it appears that flights of steps were formed at intervals all round the dome, which are now covered with the lead placed there by order of Urban VIII. The dome is constructed of bricks and rubble. Sunk bands round the hollow squares or caissons appear to be formed in brick, and the other parts in tufo and pumice stone. The thickness of the dome of the Pantheon is about 17 ft. at the base, 5 ft. 1½ in. at the top of the highest step, and 4 ft. 7 in. at the top of the dome. The circular wall which supports the dome is 20 ft. thick. This wall is however divided by several large openings, and is furnished with discharging arches of brick. It is most probable that the dome of the Pantheon was executed by means of a centering of wood with the hollow squares formed in relief upon it, as was afterwards done in constructing the great vaulting of St. Peter's.

The dome of one of the chambers of the Thermæ of Caracalla was 111 feet in diameter. In the Thermæ of Titus there are two domes each 84 feet in diameter, and in the baths of Constantine there was one of 76 feet. There were three domes in the baths of Diocletian, of which two still remain; one is 73 feet 6 inches in diameter, and the other 62 feet 3 inches. Judging from those that remain, there is every reason to believe that in the Thermæ they were all lighted from above, like the dome of the Pantheon. Near Pozzuoli there is a very perfect circular building, with a dome 96 feet in diameter, built of volcanic tufo and pumice stone. The temple of Minerva Medica, without the walls of Rome, was on the plan a polygonal dome of ten sides built of brick and pumice stone. This building does not appear to have had any opening at the top.

The antients appear to have constructed domes on corbels. At Catania there is a spherical dome which covers a square vestibule; and in one of the octagonal rooms of the enclosure surrounding the baths of Caracalla the corbels still remain which most probably supported the dome of the chamber.

The dome of Santa Sophia, at Constantinople, built in the

Parallel Section of the four principal Domes of Europe, to the same scale; by Joseph Gwilt; published by Priestley and Weale, High Street, Bloomsbury. (With the permission of the Publishers.)

reign of Justinian, is the most remarkable and the earliest constructed after those of the Romans. Anthemius of Tralles and Isidorus of Miletus were the architects. The present dome, however, was reconstructed by the nephew of Isidorus. It rests on the square formed at the intersection of the arms of the Greek cross: the diameter is about 111 feet, and the dome 40 feet high. The dome is supported by four corbellings placed in the angles of the square. The corbels are surmounted by a kind of cornice which supports a circular gallery. The lower part of the dome is pierced with a row of small windows adorned with columns on the exterior. Externally the dome is divided by projecting ribs, rounded and covered with lead. The top is surmounted by a lantern or finishing like a baluster, on which is a cross. The dome of Anthemius and Isidorus was not so high, and was partly destroyed twenty-one years after its construction by an earthquake during the lifetime of Justinian. In the reconstruction the nephew of Anthemius used very light white bricks, only one fifth the weight of common bricks, which are said to have been made in Rhodes. It appears from the history and description of the building of Santa Sophia, by Procopius, that the architects encountered many difficulties, which arose probably from not being thoroughly acquainted with the principles on which domes should be constructed. (Procopius, *περί κτισμάτων*, lib. i. cap. 1.)

The dome of San. Vitale, at Ravenna, which is considered to be more ancient than that of Santa Sophia, is curiously constructed. The lower part of the plan of the dome is a regular octagon, which is supported by eight piers placed at the angles of the dome. Between these angles are seven tall niches divided into two stories. The lower part of these niches is open, and ornamented with columns, like Santa Sophia. The eighth side of the dome is pierced with a great arch forming an entrance. This arch is of the same diameter and the same elevation as the niches. The

wall above the niches and arch, which is without openings, sustains a hemispherical dome, the plan being a circle described within a regular octagon. Corbels are not employed as at Santa Sophia, but the arches support the gathering over, or corbelling, which forms the circular base of the dome. The base of the dome is pierced with eight windows, each divided in the middle by a column which supports two small arches. The dome itself is built with a double row of pipes, hollow at one end and pointed at the other, the point of one being placed in the hollow of the preceding. They are thus continued in a gentle spiral line until they finish at the top. Between the top of the small arched windows and the pipes there is a construction formed with vases, not unlike the system adopted in the circus of Caracalla. [CIRCUS, vol. vii., p. 197.] The dome itself is covered with mortar both within and without.

The church of San Marco at Venice, built in the tenth century, by order of Pietro Orseolo, the then doge, is decorated with five domes. One of these, placed in the centre of the church, is much larger than the others. Each dome is enclosed within four pieces of semi-cylindrical vaulting, together forming a square, in the angles of which are four corbels, which gather in the circular base of each dome. The lower part of the dome is pierced with small windows. The interior is covered with mosaic, and the top of the dome is terminated with a finishing on which is a cross. In 1523 the doge, Andrea Gritti, caused the domes to be repaired, and Sansovinus, the architect, restored in a great measure the supports, and placed (at about one third of its height) a great circle of iron round the large dome to prevent its falling; a precaution which has been completely successful. The other domes are not so well preserved. In 1729 one of the smaller domes was in danger of falling, from the decay which had taken place in a circular band placed at the base of the dome. Stone was however substituted for

the wooden bond, and a circle of iron placed without the dome near its base. In 1735 Andrew Tirali, the architect to the church, placed an iron circle round the dome which is near the great gate, on account of some small fractures which were then perceived. If, however, the other domes are constructed with a wooden bond, it is very probable that they will eventually fall unless steps be taken in time to remove the timber. By the use however of corrosive sublimate, now used in Kyan's patent for preserving wood from the dry rot, wood may be used in the construction of domes with much more security as regards durability.

The celebrated dome of Santa Maria del Fiore, built by Brunelleschi, is far superior in construction to the domes of Santa Sophia and San Marco. Brunelleschi first constructed the octagon tower which supports the dome. Each face of the tower is pierced with a circular window; the walls are 17 feet thick, and the cornice which terminates the tower is 175 feet from the ground. From this cornice rises the double dome.

The external dome is 7 ft. 10 in. thick at the base. The internal dome, which is connected at the angles with the external dome, is 139 ft. in diameter and 133 ft. high from the top of the internal cornice of the tower to the eye of the lantern. This dome has eight angles, forming a species of Gothic vault, and was the first double dome with which we are acquainted. Some time after the dome was finished, several fractures were perceived in it, which were owing to settlements in the masonry; but the fractures were filled up, and no new signs of settlement have showed themselves since.

The first modern dome constructed in Rome was that of the Church of Our Lady of Loretto. It was commenced in 1507 by Antonio Sangallo. The dome, which is double, is circular on the plan. The internal dome is constructed on double consoles, instead of corbellings. The double consoles are crowned with a small cornice, forming an impost for eight arches, from the upper part of which springs the dome. On the top is a lantern light, which is not apparent externally. Up to this time domes had been constructed on walls and corbellings; but in St. Peter's at Rome a new plan was adopted. The dome of St. Peter's stands upon four piers, 61 ft. 11 in. high, and 30 ft. 10 in. thick, measured in a straight line with the arches. From the arches spring the corbellings, which are finished by an entablature. Upon this entablature is a plinth. The plinth is externally an octagon, and internally a circle. The external diameter of the octagon is 192 ft. 9 in., and the internal circle 134 ft. 8½ in.; the thinnest part of the wall, between the octagon and the circle, is 29 ft. 3 in. On the plinth is a circular stylobate, 28 ft. 6½ in. thick. This thickness is divided into three parts by a circular passage, 5 ft. 10 in. wide: the two walls on each side of this passage are, respectively, the internal wall 14 ft. 7½ in. thick, and the external 8 ft. In the internal wall are other smaller passages, 2 ft. 10 in. wide, forming flights of steps communicating with the four spiral staircases formed in the thickness of the wall of the drum of the dome. Above the circular stylobate, which is 12 ft. 4½ in. high, is placed the drum of the dome, which is 10 ft. 1½ in. thick, measured to the inside line of the pilasters, which decorate the interior of the dome. The pilasters themselves are 1'78 ft. thick in addition. The construction is formed of rubble and fragments of brick. The interior is lined with bricks stuccoed. Externally the work is faced with thin slabs of travertine stone. The drum is pierced with 16 windows, 9 ft. 3½ in. wide and 17 ft. high. The walls are strengthened on the outside, between the windows, with 16 buttresses, constructed with solid masonry. These buttresses are 13 ft. 3 in. wide and 51 ft. 6 in. in height from the base to the top of the entablature. Each buttress is decorated and strengthened with half pilasters, and terminates with two coupled columns engaged, the diameter of which is 4 ft.: the order is Corinthian. When the base of the dome had been built to the height of the entablature of the drum, Michel Angelo died; but some time before his death he had caused a wooden model to be made, with ample details, to which he added drawings and instructions. After his death Pirro Ligorio and Vignola were appointed the architects. Giacomo della Porta, the pupil of Vignola, followed his master as architect to the cathedral; but though the designs of Michel Angelo were strictly followed, the dome itself was constructed under the pontificate of Sixtus V. Sixtus gave

Giacomo della Porta as a colleague Domenico Fontana, to whom the dome was constructed.

On the constructions of Michel Angelo a circular attic was first formed, 19 ft. 2½ in. high and 9 ft. 7 in. thick. This attic is strengthened externally by 16 projections, 2 ft. 11 in. deep and 6 ft. 4½ in. wide, placed over the buttresses of the dome. On the attic rises the double dome, the internal diameter of which, at the base, is 138 ft. 5 in. The curve externally is an arc of a circle whose radius is 84 ft. 1'62 in. To the height of 27 ft. 8 in. from the attic the dome is solid. At the base the thickness is 9 ft. 7 in.; and as the external dome is raised higher than the internal dome, the thickness is increased as the curve ascends, so that where the dome is divided the thickness is 11 ft. 4 in. The circular space which divides the two domes is 3 ft. 2½ in. wide; the internal dome is 6 ft. 4 in. thick; and the height from the attic to the opening of the lantern is 83 ft. 10 in. The diameter of the lantern is 24 ft. 10 in. The external dome is 2 ft. 10½ in. thick where it separates itself from the internal dome; and it is strengthened externally by 16 projecting bands of the same thickness. The dome is pierced with three rows of small windows. As the curves of the dome are not concentric, the space between them becomes wider as it rises; so that at the opening of the lantern the space is 10 feet wide. These domes are joined together by 16 walls or spurs, diminishing in thickness as they ascend to the lantern; at the base they are 8 ft. thick, and at the summit 3 ft. The base of the lantern is arched, and pierced with small windows. Above the two domes is a circular platform, surrounded with an iron gallery. In the centre rises the lantern, on a stylobate broken into 16 parts, forming projecting pedestals, above which are buttresses similar to the buttresses of the drum, decorated externally with coupled Ionic columns, 17½ in. in diameter. The space between the buttresses is filled with arched openings, which give light to the lantern. The external diameter of the lantern is 39 ft.; the internal diameter 25 ft. 16½ in.; and the height from the platform to the top of the cross is 89 ft. 7½ in. The whole height, from the external plinth of the dome to the cross, is 263 ft. The total height from the pavement is 437 ft. 5 in. The total height internally, to the top of the dome of the lantern, is 387 ft.

Sixtus V. covered the external dome with lead, and the bands with bronze gilt. One hundred thousand large pieces of wood were used in making the centering of the domes, which was so admirably constructed, that it appeared suspended in the air. (See the drawings in the work by Fontana, on the construction of this dome.) This centering was more for the purpose of a scaffolding for the materials and workmen, than to sustain the weight of the double dome. During the construction of the dome it is believed that only two circles of iron were placed round the masonry, one of which was placed on the outside of the internal dome, at about 36 feet from its springing, and one foot above the division of the domes. The bands of iron of which this circle is composed are 3 in. wide by 1½ in. thick. A similar circle is placed about the middle of the solid part of the dome, at about 17 feet 6 inches above the springing of the internal dome. Near the top of the internal dome there are several holes, at the bottom of which upright iron bars appear. These bars are said to be the connecting rods which keep together other circles of iron placed at different heights within the masonry, which are finally terminated by a circle round the eye of the dome.

The domes were constructed with such haste, that sufficient time was not allowed to the work to form solid beds as it was carried up, in consequence of which a great number of vertical settlements took place, and the circle of iron round the internal dome was fractured. To obviate the danger arising from these settlements, six circles of iron were placed round the external dome at different heights, and the broken circle of the internal dome was repaired. The first circle was placed above the cornice of the external stylobate, or continuous plinth, on which the buttresses stand; the second circle was placed above the cornice of the buttresses, the third above the attic at the springing of the external dome, the fourth half way up the external dome, and the fifth under the base of the lantern. A sixth was shortly after placed at one foot below where the dome divides itself. The iron bands are flat, from 16 to 17 feet long, 3½ inches wide, and 2½ in. thick. At one end of the pieces of iron a hole is made; the other end is turned

up and passed through the eye of the next band. The whole of these bands are fixed with iron wedges, driven into the rubble with maliets. Sheets of lead are placed under the iron circles. In the '*Encyclopédie Méthodique*' there is a detailed account of the various fractures of the dome, and the means employed to repair them. ('Coupole,' *Encyclopédie Méthodique*, 'Architecture.')

The dome of St. Paul's cathedral, London, is placed over the intersection of the four naves. The ground plan is a regular octagon, each face of which is 44 feet 8½ inches wide: four of these sides are formed by the four great arches of the naves; the other four sides are formed by false arches of the same size; in each of these arches there is a great niche, the base of which is pierced with two arches. By this means eight supports are obtained instead of four, and the corbellings do not project too much, as in other similar constructions. The corbellings gather in a circle, the diameter of which is 104 feet 4 inches, the octagon base being 107 feet. The corbellings are surmounted by a complete entablature 8 feet 3 inches high, decorated with consoles. The drum is set back 3 feet 2½ inches from the face of the frieze, and this intermediate space is occupied by two steps and a seat. The cornice is 98 feet 9½ inches from the pavement. The height of the drum from the top of the seat is 62 feet 6½ inches to the springing of the internal dome. The wall forming the drum is inclined internally 4 feet 11½ inches, or about the 12th part of its height. This was designed by the architect to increase the resistance of the walls to the united pressure of the large internal vault and the conical dome which carries the lantern.

The interior of the drum is decorated with a continuous stylobate, on which is an order of Corinthian pilasters. The 32 spaces between the pilasters are filled with 24 windows and eight large niches. Externally the drum is decorated with an order of 32 Corinthian columns engaged, which are united to the wall of the drum by eight solid constructions in masonry. In each space between the constructions there are three intercolumnations, the columns being joined at their bases by walls pierced with arches. The external colonnade is surmounted by an entablature, with a mutilated cornice, on which is a balustrade; behind this is a terrace, formed by the recessing back. The attic is 22 feet 4½ inches high from the top of the balustrade to the under side of the cornice of the attic. Above the internal order of the drum rises the interior dome, the diameter of which at the springing is 102 feet 2½ inches by 51 feet in height. The top of the dome has a circular opening 14 feet 10½ inches in diameter.

Above the attic are two steps, from which the external dome springs. The external dome is constructed of wood, covered with lead, and decorated with projecting ribs forming pannels, curved at the ends. This dome terminates with a finishing which joins the base of the lantern: the circular gallery formed on the finishing is 274 feet 9 inches above the pavement of the nave. The lantern is supported on a conical tower, terminated by a spherical dome. This tower, which is joined to the internal dome at its base, disengages itself from it at the height of 8 feet 6 inches above the springing of the same. The perpendicular height of this tower is 86 feet 9 inches, and the walls are inclined 24 degrees from the perpendicular: the diameter of the base is 100 feet 1 inch measured externally, and 34 feet 1 inch at the springing of the spherical dome which finishes it. The wall of this tower is built of brick, and is 1 foot 7 inches thick, with circular rings of masonry, fastened with iron bands. The spherical dome at the top of the tower has an opening 8 feet in diameter at the summit. Between the attic and the wall of the tower are 32 walls or buttresses, which also serve to bear the ribs of the wooden external dome.

About the same time that Wren built the dome of St. Paul's, Hardouin Mansard, a French architect, constructed the dome of the Invalides at Paris. The plan of this dome is a square, in which is inscribed a Greek cross; in the angles of the square there are four chapels. The dome is raised in the centre of the Greek cross; the base supporting it is an octagonal figure, with four large and four small sides. The four small sides form the faces of the piers of the dome; the large sides are the arched openings of the nave and transverse aisles. A circular entablature is placed over the corbellings, and on the entablature is raised the drum of the dome, the diameter of which is 79 feet 9½ inches. The interior of the drum is decorated with a continuous

stylobate, above which are coupled pilasters of the composite order, and the wall is pierced with 12 windows. The dome, which is double, rises from a springing common to both. The lower or internal dome, constructed with masonry, is spherical, and is 83 feet in diameter, with an opening or eye at the top 53 feet 3 inches in diameter, through which part of the outer dome can be seen. The outer dome is of a spheroidal form, and constructed of stone at the base, and of brick above. Externally the dome is formed with a stylobate, on which is a Corinthian order of columns, over which is an attic with pilasters, and buttresses in the form of consoles. The drum is fortified externally by eight projections, placed two and two above each pier of the dome. The external dome is framed of wood, and covered with lead, like St. Paul's, London, but the construction is much heavier. The external diameter of the dome is 85 feet 4 inches, and its height is 57 feet 2½ inches. The finishing of the dome is decorated with consoles, on which is formed a circular balcony round the base of the lantern, constructed of wood, which is 39 feet 4½ inches high; the lantern above it, with the cross, is 35 feet 4½ inches high. The total height from the ground is 330 feet.

The dome of the Pantheon at Paris is constructed entirely of stone, and is placed in the centre of a Greek cross. It is supported by four triangular piers strengthened by engaged columns of the Corinthian order. The four piers with the lines of the intermediate arches form externally a large square, each side of which is 74 feet 9 inches.

These four piers are pierced above with arched openings, and between the piers with the openings are large arches, the diameter of which is 44 feet 11½ inches, and the height 85 feet 5 inches. Between these arches rise the corbellings, which are gathered in to form the circular plan of the drum. The arches and the corbellings are crowned with a large entablature 13 feet 4 inches high. The upper part of the cornice of the entablature is raised 101 feet above the pavement of the nave. The diameter taken at the frieze is 66 feet. The internal drum which is constructed on this entablature is 55 feet 7½ inches in height to the springing of the internal dome. The interior of this drum is decorated with a continuous stylobate, which is the basement of a colonnade of 16 Corinthian columns almost isolated from the wall. These columns are 35 feet 2½ inches in height. Between the columns are 16 windows; four of which are false, and placed above the four piers of the dome. The colonnade is crowned with an entablature, above which is a large plinth which rises to the springing of the internal dome. The internal dome is 66 feet 8½ inches in diameter at the springing, and is decorated with octagonal caissons or sinkings with a rose in the centre of each. The eye at the top of the dome is 31 feet 3½ inches in diameter. Through this eye is seen the upper part of another or intermediate dome. The external dome is placed on a circular base 108 feet 7½ inches in diameter and square at the bottom. The angles are strengthened by flying buttresses. Above the corbellings a circular wall is constructed, forming an external continuous stylobate which supports an external colonnade. The external colonnade constructed on the stylobate forms a peristyle round the dome, and is composed of 32 isolated columns of the Corinthian order 36 feet 5½ inches high. This colonnade is divided into four parts by the solid constructions in masonry raised over the four piers. The external colonnade is surmounted with an entablature and balustrade above it. There is an attic constructed above the circular wall of the drum, set back 13 feet 10 inches, and pierced with 16 windows, twelve of which light the space between the internal dome and the intermediate dome which bears the lantern. This attic is terminated with a cornice with a step or plinth above. The external dome 77 feet 8½ in diameter, measured on the outside, is constructed with masonry; the height is 45 feet 9½ inches from the top of the attic to the underside of the finishing against which the curve terminates. The outside of the dome is covered with lead, and is equally divided vertically by 16 projecting ribs. The intermediate dome, built for the purpose of carrying the lantern, was intended to be decorated with subjects by the painter, and we believe it has since been decorated. The form of this dome resembles the small end of an egg: its springing commences at the base of the attic at the point where the internal dome begins to disengage itself. This dome is 50 feet 2½ inch high, and 70 feet 3½ inches in diameter, and is pierced with four great openings at the lower part 37 feet 3 inches high,

and 30 feet 10½ inches wide at the base. On a circular platform above the summit of the dome are eight piers with arches, which support the finishing against which the external dome terminates. Above this is the lantern of the dome.

Very full details of the most remarkable domes in Europe are given in the 'Encyclopédie Méthodique' (*Architecture*), from which this brief notice is in a great measure taken. For an account of the construction of wooden-ribbed domes, see Nicholson's *Architectural Dictionary*; also the section of the Pantheon dome by Taylor and Cressy; and the work on St. Peter's, by Fontana.

The following admeasurements of most of the principal domes of Europe are from Mr. Ware's 'Tracts on Vaults and Bridges.'

DOMENICHINO, DOMENICO ZAMPIERI, called DOMENICHINO, was born at Bologna, in 1581, of poor parents. According to some authorities, his first master was Denis Calvart; but Bellori gives him Fiammingo for his first teacher. The latter, entertaining a jealous dislike (says the biographer) to the Caracci, beat his pupil, and turned him out of doors, because he found the boy copying a design by Annibale. On the occasion of his dismissal being made known to Agostino Caracci, he was admitted to the study of the Caracci, and he soon gained one of the prizes which Lodovico customarily distributed, to the surprise of his fellow-students, who had expected little from a youth of his bashful, retiring, awkward manners. After visiting Parma, Domenichino went to Rome, where he studied and worked for some time under Annibale Caracci. He afterwards obtained the patronage of Cardinal Girolamo Agucchi, and while he lived in his house painted many pictures for him. Besides painting, he studied architecture, and was appointed architect to the apostolic palace by Gregory XV. After the death of that pontiff, finding himself somewhat reduced in circumstances, and receiving an invitation to Naples, he removed thither with his wife and children. He died in 1641. During his life he was much respected. He formed a particularly strict friendship with Albano, in whose house he lived for two years when he first arrived in Rome.

Domenichino was so slow in his early progress as to disappoint many of his friends, and he had the appellation of Bue (ox) among his fellow-students; but Annibale Caracci, who perceived in him the marks of that genius which he afterwards developed, told the jeerers that their nickname was only applicable to the patience and fruitful industry of the laborious student. He retained the utmost deliberation in his mode of working to the last; and it was his custom, if he had anything to design, not to proceed at once to work with his pencil, but to reflect some time upon

his subject; when, however, he once took it in hand, slow as he was, he did not leave it until he had completed it. It is said that he had many maxims which justified his slowness: such as, that no line was worthy of an artist which was not in his mind before it was traced by his hand. He entered so fully into his subject, that he was once surprised acting the scene which he had to paint, in person, by Annibale Caracci, who burst into raptures at so instructive a lesson. Annibale ever sympathized with enthusiasm and activity of will in painting. Domenichino only left his retired study to make sketches and observations upon expression in active life, and spent much of his time in reading history and poetry.

Domenichino was profoundly studied in his drawing, rich and natural in his colouring, and, above all, correct and lifelike in his expression. Annibale is said to have been decided in his judgment between two pictures of the Scourging of St. Andrew, painted in competition by Domenichino and Agostino Caracci, by hearing an old woman point out with much earnestness the beauties of Domenichino's to a little child, describing every part as if it were a living scene, while she passed the other over in silence. To the graver design of the Bolognese school Domenichino added something of the ornamental manner of the Venetian, his pictures being rich in the accessories of architecture and costume. His genius, however, is not characterized by great invention, and he has been accused of borrowing too directly from the works of others; and his draperies have been confessed by his admirers to be harsh and too scanty in the folds. Nevertheless, he has been esteemed by the best judges (and among them are the Caracci and Nicholas Poussin) as one of the first of painters, and by some second only to Raphael. Such, however, he will never be thought by the world at large.

Domenichino excelled also in landscape, and was famous for his admirable execution of the figures with which he enlivened them. His principal works are at Rome and Naples; among them the Communion of St. Jerome and the Martyrdom of St. Agnes are the most celebrated. (Bellori.)

DOMESDAY BOOK, the register of the lands of England, framed by order of King William the Conqueror. It was sometimes termed *Rotulus Wintonie*, and was the book from which judgment was to be given upon the value, tennures, and services of the lands therein described. The original is comprised in two volumes, one a large folio, the other a quarto. The first begins with Kent, and ends with Lincolnshire; is written on three hundred and eighty-two double pages of vellum, in one and the same hand, in a small but plain character, each page having a double column; it contains thirty-one counties. After Lincolnshire (fol. 373), the claims arising in the three ridings in Yorkshire are taken notice of, and settled; then follow the claims in Lincolnshire, and the determinations of the Jury upon them (fol. 375); lastly, from fol. 379 to the end there is a recapitulation of every wapentake or hundred in the three ridings of Yorkshire; of the towns in each hundred, what number of carucates and ox-gangs are in every town, and the names of the owners placed in a very small character above them. The second volume, in quarto, is written upon four hundred and fifty double pages of vellum, but in a single column, and in a large fair character, and contains the counties of Essex, Norfolk, and Suffolk. In these counties the 'liberi homines' are ranked separate; and there is also a title of 'Invasiones super Regem.'

These two volumes are preserved, among other records of the Exchequer, in the Chapter House at Westminster: and, at the end of the second, is the following memorial in capital letters of the time of its completion: 'Anno Millesimo Octogesimo Sexto ab Incarnatione Domini, vigesimo vero regni Willielmi, facta est ista Descriptio, non solum per hos tres Comitatus, sed etiam per alios.' From internal evidence there can be no doubt but that the same year, 1086, is assignable as the date of the first volume.

In 1767, in consequence of an address of the House of Lords, George III. gave directions for the publication of this Survey. It was not, however, till after 1770 that the work was actually commenced. Its publication was entrusted to Mr. Abraham Farley, a gentleman of learning as well as of great experience in records, who had almost daily recourse to the book for more than forty years. It was completed early in 1783, having been ten years in passing through the press, and thus became generally ac-

possible to the antiquary and topographer. It was printed in fac-simile, as far as regular types, assisted by the representation of particular contractions, could imitate the original.

In 1816 the commissioners upon the Public Records published two volumes supplementary to Domesday, which now form one set with the volumes of the Record: one of these contains a general introduction, accompanied with two different indexes of the names of places, an alphabetical index of the tenants in capite, and an 'Index Rerum.' The other contains four records; three of them, namely, the Exon Domesday, the Inquisitio Eliensis, and the Liber Winton., contemporary with the Survey; the other record, called 'Boldon Book,' is the Survey of Durham, made in 1183, by bishop Hugh Pudsey. These supplementary volumes were published under the superintendence of Sir Henry Ellis.

Northumberland, Cumberland, Westmorland, and Durham were not included in the counties described in the Great Domesday; nor does Lancashire appear under its proper name; but Furness, and the northern part of that county, as well as the south of Westmorland and part of Cumberland are included within the West Riding of Yorkshire: that part of Lancashire which lies between the rivers Ribble and Mersey, and which at the time of the Survey comprehended six hundreds and 188 manors, is subjoined to Cheshire. Part of Rutlandshire is described in the counties of Northampton and Lincoln; and the two ancient hundreds of Atiscross and Existan, deemed a part of Cheshire in the Survey, have been since transferred to the counties of Flint and Denbigh. In the account of Gloucestershire we find a considerable portion of Monmouthshire included, seemingly all between the rivers Wye and Usk. Kelham thinks it probable that the king's commissioners might find it impossible to take any exact survey of the three counties northernmost of all, as they had suffered so much from the Conqueror's vengeance. As to Durham, he adds, all the country between the Tees and Tyne had been conferred by Alfred on the bishop of this see; and at the coming in of the Conqueror he was reputed a count-palatine.

The order generally observed in writing the Survey was to set down in the first place at the head of every county (except Chester and Rutland) the king's name, *Rex Wilhelmus*, and then a list of the bishops, religious houses, churches, any great men, according to their rank, who held of the king in capite in that county, likewise of his thains, ministers, and servants; with a numerical figure in red ink before them, for the better finding them in the book. In some counties the cities and capital boroughs are taken notice of before the list of the great tenants is entered, with the particular laws or customs which prevailed in each of them; and in others they are inserted promiscuously. After the list of the tenants, the manors and possessions themselves which belong to the king, and also to each owner throughout the whole county, whether they lie in the same or different hundreds, are collected together and minutely noted, with their under-tenants. The king's demesnes, under the title of *Terra Regis*, always stand first.

For the adjustment of this Survey certain commissioners, called the king's justiciaries, were appointed. In folios 164 and 181 of the first volume we find them designated as 'Legati Regis.' Those, for the midland counties, at least, if not for all the districts, were Remigius, bishop of Lincoln, Walter Giffard, earl of Buckingham, Henry de Ferrers, and Adam, the brother of Eudo Dapifer, who probably associated with them some principal person in each shire. These inquisitors, upon the oaths of the sheriffs, the lords of each manor, the presbyters of every church, the reves of every hundred, the bailiffs and six villans of every village, were to enquire into the name of the place, who held it in the time of king Edward, who was the present possessor, now many hides in the manor, how many carucates in demesne, how many homagers, how many villans, how many cotarii, how many servi, what free-men, how many tenants in socage, what quantity of wood, how much meadow and pasture, what mills and fish-ponds, how much added or taken away, what the gross value in king Edward's time, what the present value, and how much each free-man, or soc-man had or has. All this was to be triply estimated: first, as the estate was held in the time of the Confessor; then as it was bestowed by king William; and thirdly, as

its value stood at the formation of the Survey. The jurors were, moreover, to state whether any advance could be made in the value. Such are the exact terms of one of the inquisitions for the formation of this Survey, still preserved in a register of the monastery of Ely.

The writer of that part of the Saxon Chronicle which relates to the Conqueror's time, informs us with some degree of asperity, that not a hide or yardland, not an ox, cow, or hog, was omitted in the census. It should seem, however, that the jurors, in numerous instances, framed returns of a more extensive nature than were absolutely required by the king's precept, and it is perhaps on this account that we have different kinds of descriptions in different counties.

From the space to which we are necessarily limited, it is impossible to go more minutely into the contents of this extraordinary record, to enlarge upon the classes of tenantry enumerated in it, the descriptions of land and other property therewith connected, the computations of money, the territorial jurisdictions and franchises, the tenures and services, the criminal and civil jurisdictions, the ecclesiastical matters, the historical and other particular events alluded to, or the illustrations of ancient manners, with information relating to all of which it abounds, exclusive of its particular and more immediate interest in the localities of the country for the county historian.

As an abstract of population it fails. The tenants in capite, including ecclesiastical corporations, amounted scarcely to 1400; the under-tenants to somewhat less than 8000. The total population, as far as it is given in the record itself, amounts to no more than 282,242 persons. In Middlesex, pannage (payment for feeding) is returned for 16,535, in Hertfordshire for 30,705, and in Essex for 92,991 hogs; yet not a single swine-herd (a character so well known in the Saxon times) is entered in these counties. In the Norman period, as can be proved from records, the whole of Essex was, in a manner, one continued forest; yet once only in that county is a forester mentioned, in the entry concerning Writtle. Salt-works, works for the production of lead and iron, mills, vineyards, fisheries, trade, and the manual arts, must have given occupation to thousands who are unrecorded in the survey; to say nothing of those who tended the flocks and herds, the returns of which so greatly enlarge the pages of the second volume. In some counties we have no mention of a single priest, even where churches are found; and scarcely any inmate of a monastery is recorded beyond the abbot or abess, who stands as a tenant in capite. These remarks might be extended, but they are sufficient for their purpose. They show that, in this point of view, the Domesday Survey is but a partial register. It was not intended to be a record of population further than was required for ascertaining the geld.

There is one important fact, however, to be gathered from its entries. It shows in detail how long a time elapsed before England recovered from the violence attendant on the Norman Conquest. The annual value of property, it will be found, was much lessened as compared with the produce of estates in the time of Edward the Confessor. In general, at the Survey, the king's lands were more highly rated than before the Conquest; and his rent from the burghs was greatly increased; a few also of the larger tenants in capite had improved their estates; but, on the whole, the rental of the kingdom was reduced, and twenty years after the Conquest the estates were, on an average, valued at little more than three fourths of the former estimate. An instance appears in the county of Middlesex, where no *Terra Regis* however occurs. The first column, headed *T. E. C.*, shows the value of the estates in the time of king Edward the Confessor; the second, the sums at which they were rated at the time of the Survey, *tempore Regis Wilhelmi*—

We shall now say a few words on the uses and consequences of the Survey. By its completion the king acquired an exact knowledge of the possessions of the crown. It afforded him the names of the landholders. It furnished him with the means of ascertaining the military strength of the country; and it pointed out the possibility of increasing the revenue in some cases, and of lessening the demands of the tax-collectors in others. It was moreover a register of appeal for those whose titles to their property might be disputed.

Appeals to the decision of this Survey occur at a very early period. Peter of Blois notices an appeal of the monks of Croyland to it in the reign of Henry I. Others occur in the *Abbreviatio Placitorum* from the time of John downward. In later reigns the pleadings upon antient demesne are extremely numerous: and the proof of antient demesne still rests with the Domesday Survey. Other cases in which its evidence is yet appealed to in our courts of law, are in proving the antiquity of mills, and in setting up prescriptions *in non decimando*. By stat. 9 Edw. II., called *Articuli Cleri*, it was determined that prohibition should not lie upon demand of tithe for a new mill. The mill, therefore, which is found in Domesday must be presumed older than the 9th Edw. II., and is, of course, discharged, by its evidence, from tithe.

On the discharge of abbey-lands from tithes, as proved by Domesday, it may be proper to state that pope Paschal II. at an early period, exempted generally all the religious from paying tithes of lands in their own hands. This privilege was afterwards restrained to the four favoured Orders, the Cistercians, the Templars, the Hospitalers, and the Premonstratensians. So it continued till the fourth Council of Lateran in 1215, when the privilege was again restrained to such lands as the abbays had at that time, and was declared not to extend to any after-purchased lands. And it extends only to lands *dum propriis manibus coluntur*. From the paucity of dates in early documents, the Domesday Survey is very frequently the only evidence which can be adduced that the lands claiming a discharge were vested in the monastery previous to the year expressed in the Lateran Council.

Although in early times, Domesday, precious as it was always deemed, occasionally travelled, like other records, to distant parts, till 1696 it was usually kept with the king's seal, at Westminster, by the side of the Tally Court in the exchequer, under three locks and keys, in the charge of the auditor, the chamberlains, and deputy chamberlains of the exchequer. In the last-mentioned year it was deposited among other valuable records in the Chapter House, where it still remains.

The two most important works for the student of the Domesday Survey are Kelham's *Domesday Book illustrated*, 8vo., Lond., 1788, and the *General Introduction* to the survey, reprinted by command of His Majesty under the direction of the commissioners on the Public Records, 2 vols., 8vo., 1833, accompanied by fresh indices. A translation of the whole, under the title of 'Dom-Boc,' was undertaken early in the present century by the Rev. William Bawdwen, vicar of Hooton Pagnell, in Yorkshire, who published Yorkshire, with the counties of Derby, Nottingham, Rutland, and Lincoln, in 4to., Doncaster, 1809, followed by the counties of Middlesex, Hertford, Buckingham, Oxford, and Gloucester, 4to., Doncaster, 1812; but the work went no further. County portions of this record will be found translated in most of our provincial histories; the best are undoubtedly those in Dugdale's *Warwickshire*, Nichols's *Leicestershire*, Hutchins's *Dorsetshire*, Nash's *Worcestershire*, Bray and Manning's *Survey*, and Clutterbuck's *Hertfordshire*. Mr. Henry Penruddocke Wyndham published *Wiltshire*, extracted from Domesday Book, 8vo. Salisb. 1788, and the Rev. Richard Warner, *Hampshire*, 4to. Lond., 1789. *Warwickshire* has been published recently by Mr. Reader. There are numerous other publications incidentally illustrative of Domesday topography, which the reader must seek for according to the county as to which he may desire information.

DOMINANT, in music, the fifth of the key. Thus, if the key be C, the dominant is G.

DOMINGO, ST. [*HISPANIOLA*.]

DOMINICA, one of the Antilles, belonging to the English, and lying between the French islands of Martinique and Guadeloupe: the parallel of 15° 18' N. lat. and the meridian of 61° 28' W. long. pass through the island. *Dominica*. No. 540.

minica was discovered by Columbus in 1493, and received its name in consequence of its being first seen on a Sunday. The right of occupancy was long claimed equally by England, Spain, and France, without any active measures being taken on the part of any of those powers for its exclusive possession; so that it became virtually a kind of neutral ground until the year 1759, when its possession was assumed by the English, and their right to hold it was formally recognized, in 1763, by the treaty of Paris. On this occasion commissioners were sent out by the English government, who sold the unsettled lands by auction to the highest bidders. In this way nearly half the island was disposed of in small lots, at prices amounting on the average to 65s. per acre. The occupiers of lands already settled were confirmed in their possession by leases granted for forty years, and renewable, at the annual rent of 2s. per acre. In 1778 *Dominica* was taken by a French squadron under the Marquis de Bouillé, but was restored to England at the peace in 1783. In 1805 the island was again attacked by the French fleet under Admiral Villeneuve, but was successfully defended by the garrison under Sir George Prevost.

Dominica is 28 miles long and 16 miles broad in the broadest part; but its mean breadth is not more than 9 miles. No regular survey has ever been made; but the area is computed at 260 square miles. The origin of the island is volcanic. Pumice-stone, sulphur, and other volcanic productions are found. An attempt was recently made to trade in sulphur with the United States, but the speculation proved unsuccessful. There are numerous quarries of a volcanic lava, sufficiently durable for the purpose of ordinary buildings, which are worked for the use of the colony. The surface of the island is rugged, and its mountains are among the highest in the Antilles. *Morne Diablotin* is 5300 feet above the sea. The valleys are very fertile, and watered by numerous streams, of which there are thirty in different parts. About the centre of the island, and about six miles from the town of Roseau, on the top of a high mountain, is a fresh-water lake, with an area of several acres, and in some parts unfathomable. The soil in the valleys having been washed down from the hills by the periodical rains and mixed with decayed vegetable matter, has formed a light brown coloured mould, which is highly productive; towards the coast the soil is a fine deep black mould on a subsoil of yellow brick clay. The island contains an abundance of large timber-trees of the kinds commonly found in the West India Islands; among these the trunks of the gum-trees are hollowed out to form canoes. The streams abound with excellent fish, among which are mullets, pike, eels, and crayfish; the fishery on the coast also yields abundantly for the supply of the inhabitants.

The principal produce of *Dominica* consists of sugar (and of course rum) and coffee; the quality of the latter has a higher repute than that of any other of the West India Islands. The island is unequally divided into ten parishes. The town Roseau is in St. George's parish, on the south-west side of the island, and on a tongue of land, having Woodbridge Bay on the north and Charlotteville Bay on the south. The town is regularly built, with long and wide paved streets, which intersect each other at right angles. The roadstead is safe, although the anchorage is far from good, from October to August; but during the hurricane months a heavy sea frequently rolls in from the south. Prince Rupert's Bay, on the north-west side of the island, is at all times safe and commodious.

The population, according to a census taken in 1833, consisted of—

| | Males. | Females. | Total. |
|----------------------|--------|----------|--------|
| Whites | 382 | 338 | 720 |
| Free coloured people | 1,673 | 2,141 | 3,814 |
| Slaves | 6,802 | 7,324 | 14,126 |
| Total, 8,857 | 9,803 | 18,660 | |

The population of the town consisted of 244 whites, 1289 free coloured people, and 739 slaves; altogether, 2272 persons. There were in 1835, in Roseau, 3 schools, in which there were 245 children, taught according to the Madras system; there was one other school, in the parish of St. Joseph, wherein 40 children were instructed. The greater part of the inhabitants profess the Roman Catholic faith.

The shipping that arrived and sailed from the island in 1835 were as follows:—

| | Ships. | Arrived. Tons. | Men. | Ships. | Sailed. Tons. | Men. |
|------------------|--------|-------------------|-------|--------|------------------|-------|
| Great Britain | 7 | 1,783 | | 6 | 1,515 | |
| British colonies | 100 | 4,340 | | 112 | 5,585 | |
| United States | 36 | 4,682 | | 18 | 2,206 | |
| Foreign parts | 79 | 1,846 | | 87 | 3,615 | |
| Total, | 222 | 12,651 | 1,154 | 223 | 12,921 | 1,172 |

The imports consist principally of plantation stores, cotton, linen, and woollen manufactures from England; corn, fish, and lumber from the British North American colonies and the United States, and live stock from the neighbouring continent of America. The exports are principally coffee, sugar, and rum. The quantities shipped in 1832, 1833, and 1834, were as follows:—

| | 1832. | Value. | 1833. | Value. | 1834. | Value. |
|--------|----------------|----------|--------------|----------|--------------|----------|
| Coffee | 1,365,392 lbs. | 45,146l. | 897,555 lbs. | 30,701l. | 896,891 lbs. | 26,273l. |
| Sugar | 6,256,992 | 84,792 | 5,356,512 | 74,952l. | 5,996,938 | 77,328 |
| Rum | 51,100 gals. | 4,607 | 44,097 | 3,338 | 46,090 | 3,375 |

DOMINICAL LETTER (*dies dominica*, Sunday). To every day in the year is attached one of the first seven letters, A, B, C, D, E, F, G; namely, A to the first of January, B to the second, &c.; A again to the eighth of January, and so on. The consequence is, that all days which have the same letter fall on the same day of the

week. The *dominical letter* for any year is the letter on which all the Sundays fall. Thus, the first of January, 1837, being Sunday, the dominical letter for 1837 is A. In a common year, the first and last days have the same letters, whence the dominical letter of the succeeding year is one earlier in the list: that is, the dominical letter for 1838 is G. But in leap-year, it is to be remembered that the 29th of February has no letter attached to it: whence every leap-year has two dominical letters, the first for January and February, the second for all the rest of the year, the second being one earlier than the first. The following will now be easily understood; each year is followed by its dominical letter; 1837, A; 1838, G; 1839, F; 1840, E, D; 1841, C; 1842, B; 1843, A; 1844, G, F, &c.

As it is convenient in historical reading to be able to find the day of the week on which a given day in a distant year fell, we subjoin the following tables. The middle column of figures contains the tens and units of the year in question, while the figures at the head contain the hundreds and tens of hundreds. Thus for the years 536 and 1772, look for 36 and 72 in the middle column, and for 5 and 17 at the head. On the right of the middle column is all that relates to the *old style*; on the left all that relates to the *new style*. The large letters on the left refer to years after Christ, the small letters to years before Christ.

| OLD STYLE. The large letters refer to years <i>after</i> the Christian Era, and the small letters to years <i>before</i> it. | | | | | | | NEW STYLE. | | | | |

DOMINICANS. [BLACK FRIARS.]

DOMITIANUS, TITUS FLAVIUS, younger son of the Emperor Vespasianus, succeeded his brother Titus as emperor, A.D. 81. Tacitus (*Histor.*, iv., 51, 68) gives an unfavourable account of his previous youth. The beginning of his reign was marked by moderation and a display of justice bordering upon severity. He affected great zeal for the reformation of public morals, and punished with death several persons guilty of adultery, as well as some vestals who had broken their vows. He also forbade under severe penalties the practice of emasculation. He completed several splendid buildings begun by Titus; among others, an Odeum, or theatre for musical performances. The most important event of his reign was the conquest of Britain by Agricola; but Domitian grew jealous of that great commander's reputation, and recalled him to Rome. His suspicious temper and his pusillanimity made him afraid of every man who was distinguished either by birth and connexions or by merit and popularity, and he mercilessly sacrificed many to his fears, while his avarice led him to put to death a number of wealthy persons for the sake of their property. The usual pretext for these murders was the charge of conspiracy or treason; and thus a numerous race of informers was created and maintained by this system of spoliation. His cruelty was united to a deep dissimulation, and in this particular he resembled Tiberius rather than Caligula or Nero. He either put to death or drove away from Rome the philosophers and men of letters; Epictetus was one of the exiled. He found, however, some flatterers among the poets, such as Martial, Silius Italicus, and Statius. The latter dedicated to him his *Thebais* and *Achilleis*, and commemorated the events of his reign in his *Silvæ*. But in reality the reign of Domitian was anything but favourable to the Roman arms, except in Britain. In *Mæsia* and *Dacia*, in Germany and Pannonia, the armies were defeated, and whole provinces lost. (Tacitus, *Agricola*, 41.) Domitian himself went twice into *Mæsia* to oppose the *Dacians*, but after several defeats he concluded a disgraceful peace with their chief *Decabalus*, whom he acknowledged as king, and agreed to pay him a tribute, which was afterwards discontinued by Trajan; and yet Domitian made a pompous report of his victories to the senate, and assumed the honour of a triumph. In the same manner he triumphed over the *Catti* and the *Sarmatians*, which made Pliny the Younger say that the triumphs of Domitian were always evidence of some advantages gained by the enemies of Rome. In 95 A.D. Domitian assumed the consulship for the seventeenth time, together with Flavius Clemens, who had married Domitilla, a relative of the emperor. In that year a persecution of the Christians is recorded in the history of the church, but it seems that it was not directed particularly against them, but against the Jews, with whom the Christians were then confounded by the Romans. Suetonius ascribes the proscriptions of the Jews, or those who lived after the manner of the Jews, and whom he styles as 'improfecti,' to the rapacity of Domitian. Flavius Clemens and his wife were among the victims. [CLEMENS ROMANUS.] In the following year, A.D. 96, under the consulship of Fabius Valens and C. Antistius Vetus, a conspiracy was formed against Domitian among the officers of his guards and several of his intimate friends, and his wife herself is said to have participated in it. The immediate cause of it was his increasing suspicions, which threatened the life of every one around him, and which are said to have been stimulated by the predictions of astrologers and soothsayers, whom he was very ready to consult. He was killed in his apartments by several of the conspirators, after struggling with them for some time, in his

forty-fifth year, after a reign of fifteen years. On the news of his death, the senate assembled and elected M. Cocceius Nerva emperor.

The character of Domitian is represented by all ancient historians in the darkest colours, as being a compound of timidity and cruelty, of dissimulation and arrogance, of self-indulgence and stern severity towards others. He punished satirists, but encouraged secret informers. He took a delight in inspiring others with terror, and Dion relates a singular banquet, to which he invited the senators, with all the apparatus of a funeral and an execution. He is also said to have spent whole hours in hunting after and killing flies. At one time, before his becoming emperor, he had applied himself to literature and poetry, and he is said to have composed several poems and other works. (Tacitus, Suetonius, Dion, and Pliny the Younger.)

DON, the (Douna or Tuna in Tartar, and Tongoul in Calmuck), a considerable river of European Russia, and in the latter part of its course the boundary between Europe and Asia. It rises about 54° N. lat. in the small lake Ivanofskoe, in the government of Tula, close to the borders of the government of Ryazan, and thence flows in a general S. S. E. direction until it has passed Paulofsk, after skirting the southern extremity of the government of Ryazan and north-western parts of that of Tambof, and traversing the greater part of the government of Voronezh. Within these limits the Don receives the Sosva, Voronezh near Tavtof, and Sosna near Korotoszak. From Paulofsk it inclines more to the east, and quitting the government of Voronezh, enters the western districts of the territory of the Don Cossacks: soon afterwards it turns due east, and after having been joined by the Khoper at Khopeiskaya, the Medveditsa near Ostrofskaya, and the Ilawla above Katchokinskaya, flows with numerous bendings until it approaches the mountains of the Volga, through which it forces a passage about forty-five miles from that river. The Don now proceeds in a south-western and then a W. S. W. direction towards its mouth, near which it receives on its right bank, above New Tsherkask, the Donecz, or Little Don, the most considerable of its tributaries, which rises above Belgorod, in the government of Kursk, and is upwards of four hundred miles in length. On its left bank the Don is joined by the Manish, which rises on the southern termination of the Irgeni mountains, crosses the great Caucasian steppe, flows through lake Bolshoi, and falls into the Don at Tsherkask. The Don discharges its waters by three branches into the sea of Azof, not far from Nachikgefan, Asof, and Tsherkask, about 46° 40' N. lat. The length of its course is estimated at about 900 miles, but the distance from its source to its mouth would not exceed 490. It has a very slow current, and abounds in shallows and sand-banks, but has neither falls nor whirlpools. In spring it overflows its banks, and forms broad and unwholesome swamps; it is navigable as high as Zadonsk, and has depth of water enough from the middle of April to the end of June for the larger description of vessels, but is so shallow during the remainder of the year, that there is scarcely two feet of water above the sand-banks. Its mouths are so much choked with sand as to be unnavigable for any but flat boats. The current of its tributaries is also sluggish, and none but the Donecz are navigable. As far as Voronezh, near the junction of the Voronezh and Don, the river flows between fertile hills; but from that point until its passage through the chain of the Volga, its left bank is skirted by lowlands, and its right by a range of uplands; thence to its confluence with the Donecz, its high bank is skirted by chalk hills, and its left is bounded by a continued steppe. The waters of the Don are impregnated with chalk, and are muddy, and prejudicial to the health of those who are unused to them: they however abound in fish, though in this respect the Don is much inferior to the Volga. The Don is the Tanais of Herodotus (iv., 57) and other Greek and Roman writers. Herodotus states that the river rises in a large lake and flows into one still larger, the Maetis, or sea of Azof. The Hyrgis, which he mentions as a tributary of the Don, appears to be the Donecz.

DON-COSSACKS, the Territory of the (or, in Russian, Donskich Kosak of Zembla), so called from the river Don, is a free country which acknowledges the Russian sovereign as its chief, but is not reduced to the condition of a province, or organized as a government, like other parts of the empire. It lies between 47° and 54° N. lat., and 55° and

Coin of Domitian.

British Museum. Actual size. Copper. Weight, 48½ grains.

67° E. long.; and is bounded on the north by the governments of Voronezh and Saratof, on the east by Astrachan, on the south-east by the government of Caucasia, on the south-west by the sea of Azof and the Nogay Steppes in Taurida, and on the west by the governments of Ekaterinoslaf and the Ukraine. It occupies an area of about 76,000 square miles.

The general character of the country is that of a plain, in many parts consisting entirely of steppes, especially in the south-eastern districts bordering on the Sal and Manitsh. The interior is a complete flat, but in the north and along the banks of the Don there are slight elevations, and the south-eastern parts bordering on lake Bolskoi are traversed by low offsets of the Caucasian mountains. The rest of the country, with the exception of the parts immediately adjacent to the banks of the larger rivers, is a broad steppe, which contains abundance of luxuriant pasturage intermixed with tracts of sand and sluggish streams. The whole territory does not contain a single forest, and even brushwood is only occasionally found. The northern districts are far the best adapted for agriculture; the southern, where the soil is saline and sandy, for grazing. The steppes are full of low artificial mounds and ancient tumuli, which are so numerous in some places as to give rise to the conjecture that they are the vestiges of some great and extinct race, probably of Mongolian origin, as the rude images in stone erected over some of them bear, in their features and peculiar style of head-dress, traces of that origin. Many of these tombs have been opened, and found to contain gold and silver urns, rings, buckles, &c.

The chief river is the Don, which enters the territory in the west, winds across it to the east, and then turning suddenly round, flows through the eastern and southern districts to the sea of Azof. In its course through this country it is joined by the Khoper, Medwedica, Ilawla, Sal, Donecz, and several minor streams. Besides these there are several other rivers which discharge their waters into the sea of Azof, such as the Krinka, Kagalnik, Yega, &c.; and there are numerous streams in the steppes, of which the greater part terminate in marshes, and are dry in summer. The principal lake is the Bolskoi, an enlarged bed of the Manitsh, about 70 miles long and 9 broad, the length of which forms for that distance the boundary between the territory of the Don-Cossacks and Caucasia. Next to this the most considerable lakes are those of Nowoe and Staroe-Osero, which are covered in summer with an incrustation of salt from one to two inches in thickness, of which they furnish an abundant supply. No mineral springs have yet been discovered.

The country enjoys a mild and not unhealthy climate. The spring sets in early, and in the summer, which is of long continuance, the land is refreshed by frequent showers; the autumn is at times damp and foggy, and the winter, though clear and not accompanied with much snow, is severe and attended by much stormy weather. The rivers are closed by ice from the end of November to the month of February. Failures of the harvest are rare, but the inhabitants often suffer severely from the ravages of the locust, which is the scourge of the country.

Agriculture, cattle-breeding, the fisheries, and the cultivation of the vine, constitute the principal occupations of the Don-Cossacks; but, according to the most recent writer on this country, Schnitzler, agriculture, not the rearing of cattle, as most authors have affirmed, forms the chief employment of the people. In the low-lands of the north, which lie along the banks of rivers, the soil is very fertile, and produces grain of various kinds, such as rye, barley, wheat, oats, maize, and buckwheat; also peas, flax, and hemp. But even in the south, fields are found in the heart of the steppes at a distance of thirty and even forty miles from the Don, with rich crops of grain upon them; these fields are cultivated by the richer class of proprietors. In 1832, 91,486 tshetwerts of winter-corn (about 68,370 quarters), and 359,643 (about 260,230 qrs.) of spring-corn were sown; the former yielded two, and the latter three grains for one, without the use of manure or much cost of labour. The average crops of wheat are estimated at about two millions of tshetwerts (1,447,180 quarters) annually. None of the Cossack families are without gardens, in which they raise vegetables of the ordinary descriptions, melons, cucumbers, and fruit; the last is not however an object of much attention. The culture of the vine was introduced by Peter the Great, and has been followed up with

spirit, especially along the banks of the Don, where a very pleasant wine, not unlike Champaign, is made, and has become a favourite beverage in Russia. There are superior kinds, the Stanitze and Zimlyanskoye, which resemble Burgundy in colour and flavour; but the favourite species is the Vinomarovka, or frozen wine, which is made from a mixture of wine with brandy and the juice of various berries. In what is called the 'First Natshaltsoe (district) of the Don,' which lies east of Tsherkask, there are at present 9710 vineyards, and in the 'Second,' north-east of Tsherkask, 2590; these vineyards contain from 200 to 800, and even as many as 1000 vines, and about fifteen different kinds of grasses. The inferior descriptions of wine are red ones, of which about 70,000 vedros (about 225,800 gallons) are annually sent to Moscow, and 30,000 (about 96,770 gallons) to Kharkof, beside considerable quantities to Kursk and other parts. The yearly sale of these wines produces about two millions of roubles, or 92,000*l.* sterling. The vines also yield about 10,000 vedros (32,250 gallons) of brandy spirit annually.

The rearing of cattle is pursued with great industry both by the Cossacks and Calmucks; the wealth of the more affluent among them consists, in fact, of their numerous herds and flocks, and they have large Khutors, or cattle-farms, for breeding them in the steppes. The native Cossack horse is small and spare in flesh, with a thin neck and narrow croup; he is, on the whole, an ill-looking animal, but strong, fleet, and hardy. The common Cossack is rarely owner of less than three or four horses, but many of the Tabunes or herds, of the wealthier breeders, contain 1000 or more. All, with the exception of the saddle-horses, are kept on the pasture-grounds throughout the year, and in winter are forced to seek for their food either beneath the snow or from the high reeds on the banks of rivers. The Cossack himself does not keep either camels or dromedaries, but they are reared by their Calmuck fellow-countrymen and thrive well on the saline plants of the steppes. Next to the horse the sheep is the most common domestic animal; the ox is used for draught; goats are bred principally by the Calmucks; but swine and buffaloes are rare. The stock of the Cossack population in 1832 was composed of 257,211 horses, of which 123,328 were mares, 2,110,539 sheep, from which 217,775 poods (about 7,839,900 pounds) of wool were obtained; and 840,683 heads of horned cattle. The Calmucks at that time possessed 33,747 horses, 55,574 heads of cattle, 28,574 sheep, and 1365 camels and dromedaries.

The chase is unproductive, as the steppes are not the usual resort of wild animals or of much game; wolves, foxes, marsh-cats, dwarf otters, martens, marmots, jerboas, a species of gazelle, and hares are occasionally met with. Of wildfowl there are the steppic-fowl (*Otis tetrax*), water-stalking, Muscovy duck, swan, snipe, pelican, and falcon. The principal amphibious animals are tortoises. The steppes also breed the Polish cochineal insect, of which however no use is made, the silkworm, and the cantharides.

Next to agriculture the people derive their chief subsistence from their fisheries. Fish indeed is their ordinary food, and consists of the sturgeon, trout, pike, tench, perch, salmon, carp, &c., for which the richest fishing grounds are the Don and the shores of the sea of Azof. The produce of 1832 was 1,033,935 poods (about 37,221,660 pounds weight), of which 496,512 poods were appropriated to internal consumption, and the remainder was exported. Caviar and isinglass are sent abroad in large quantities. Turtles and crabs in immense numbers, and of large size, are taken in the Don and its tributary streams.

The Cossacks rear little poultry, but they keep large stocks of bees; the number of apiaries a few years ago was 1044, which contained 30,201 hives, and produced annually 8299 poods (about 298,764 pounds weight) of honey and wax.

Trades and mechanical pursuits are carried on only in the two chief towns, New and Old Tsherkask, and the larger stanitzes, or villages; for as the Cossack depends upon himself for the supply of his daily wants, there is consequently little encouragement for the manufacturer and mechanic. The only large manufactures are caviar, wax, and isinglass. The exports are inconsiderable, and consist principally of horses, cattle, tallow, skins, glue, fish, and their products, wine, and a little grain; the greater part of these exports are sent to Taganrog, which is the chief mart

for the sale of what the country produces, or find a vent at the periodical fairs of Tsherkask, &c. They amounted in 1832 to 4,943,930 rubles (about 226,600*l.*), while the imports in that year were to the extent of 13,886,133 rubles (about 666,450*l.*)

The territory of the Cossacks is divided into seven Notchalstoe, or provinces, namely, 1. Aksai, on the Don, in which are Old Tsherkask, and New Tsherkask (14,000 inhabitants), the only towns in the country; 2. The First District of the Don, containing the large villages of Troilinskaya, Bistrianskaya, Tsiemlianskaya, &c.; 3. The Second District of the Don, with the large villages of Tsherskaya, and Gelubinskaya; 4. Medwediesza, with the large villages of Ust-Mestwediesza, Beresofska, and Ostiofskaya; 5. Koperskye, with the large villages of Urupinskaya (1200), Kotofskaya and Dobrinskaya; 6. Doneczskaya, with the large villages of Kasanskaya, Luganskaya, and Mikitenska; and 7. Minsk, with the large villages of Grabova and Alexiefkaya.

The great mass of the population are Cossacks and Little Russians, among whom a number of Great Russians, Nogay-Tartars, Gypsies, Armenians, and Greeks, are intermixed. The Calmuck part of the population are a nomadic people: in 1832 their numbers were 16,413, of whom 7889 were males and 8524 females. The following is given as the official return of the remaining inhabitants of the territory:—

| | |
|--|---------|
| Bondsmen in the service of Cossack proprietors | 389,371 |
| Free labourers, &c. | 123,299 |

512,670

This return does not comprise the chiefs or great land-owners, or the ecclesiastics, nor probably the principal star-chines or nobility; it may be concluded, therefore, that Arsenief's calculation, that the population amounts to 500,000 of all classes, is not above the mark. The census of 1796 gave 366,274, but there are reasonable grounds for questioning its correctness.

The territory of the Don Cossacks, which is more extensive than the whole area of the Austrian States in Germany, contains but two towns, and 120 stanitzes. The villages, many of which have markets, are always placed on the banks of rivers and composed of from fifty to three hundred houses, well built, clean, and conveniently arranged, with one or more churches of stone or wood. Some of these stanitzes are large, and resemble towns, and are surrounded by a wall and narrow ditch; the khutors, or stables, stalls, &c., lie outside of them. The Cossacks, who have been settled in the country since 1569, are genuine Little Russians, and speak pure Russian mixed with occasional provincialisms. They are proverbially hospitable and cheerful, but violent when excited; and although they consider the plunder of their enemy lawful in war, theft is almost unknown among them. Their mode of life is in general very simple and frugal, and the enjoyment of civil freedom has given them an independence of mind, which places them far higher in the social scale than the abject Russian. Their star-chines, or nobles, are in general well educated. With regard to public instruction, their establishments are within the jurisdiction of the University of Kharkof. The state of those establishments was in 1825, 12 schools with 46 teachers and 937 pupils, and in 1832, the same number with 45 teachers and 1031 pupils, all males. Besides these, there are 5 ecclesiastical seminaries in the Eparchy of New Tsherkask, with 10 teachers and 274 students. The entire number of scholars, therefore, was 1035, which averages very nearly 1 scholar in every 580 inhabitants. But, as the Raskolniks, a sect of the Græco-Russian church, have doubtless schools of their own, this proportion can be approximative only.

In respect of church matters, this territory was formerly dependent upon the diocese of Voronesh, but the eparchate of New Tsherkask was established expressly for it by the ukase of May, 1829: it contained in 1830 369 churches, of which 5 are cathedrals, beside three monasteries and one convent. The majority of the people are of the Russo-Greek church. The Calmucks are Lamaists, and the Nogay and other Tartars are Mohammedans.

The Cossacks are exempt from taxes, but are liable to do military duty, and are bound to dress, arm, and equip themselves entirely at their own expense, in return for which the government provides for their maintenance while in the field, allows them pay, and supplies them with field equipage. Few Cossacks are unskilled in the use of the bow and

arrow, although they do not use them in war. Their principal weapon in battle is the lance. They live under a military government wholly distinct from the government of every other Russian province, at the head of which is a Voiskovoi-Attaman, or Captain-general; but as the present emperor has vested this office in the heir-apparent, his powers are delegated to a Nakazmi or Vice-Attaman; and on this model every stanitze has its local attaman, who is elected by the inhabitants. The Cossacks have a supreme council of state, called the Chancery of the Voiskofnya, or Captaincy, which controls both the civil as well as the military affairs of the territory. The attaman or his deputy is its president, and he is assisted by two perpetual members and four other members, who are elected by the people every three years. The expenses of the administration, including the allowances to the vice-attaman, the attorney-general, and the officers attached to the attaman, amounted in 1832 to upwards of 150,000 silver rubles (about 26,000*l.*)

The Cossacks are divided into Polks, or regiments, and Sotnyes, or companies; which last are again divided into sections: each polk has a standard-bearer and a major. In return for the exemption from taxes, crown monopolies, and other privileges, they are bound to keep in a constant state of readiness for the Imperial service about 25,000 cavalry, who are reckoned among the regular Cossacks. From the age of 15 to 50 every Cossack is a soldier, and in case of pressing emergency, all males capable of service are bound to take up arms. The Calmucks are governed by the same laws, and subject to the authority of the Voiskovoi-Attaman. They are equally bound to serve with their Cossack fellow-countrymen, by whom, however, they are held in great contempt. They dwell in tents of skin, lead a wandering life, and are exclusively occupied in rearing cattle, sheep, camels, and especially horses, with which they supply the Russian light cavalry.

The Cossacks pay much attention to their dress; which consists of a blue jacket, frequently laced with gold and lined with silk, a silk vest and girdle, full white trowsers, and black woollen cap, with a large red bag dangling behind. The females, who are inferior in symmetry of form to the males, have agreeable features, a florid complexion, and fine black eyes. They wear a long falling tunic of cotton or silk, partly open in front, and confined by an ornamental waistband. Beneath this upper garment appear broad trowsers, with which yellow boots are usually worn. The hair of the unmarried female floats in long braided tresses over the shoulder, but when married she conceals it under a cap richly embroidered with gold and pearls. Their dances resemble those of the Russian gypsies, and are performed by two persons only, who accompany their movements with loud cries.

DONAGHADEE, a mail-packet station, in the barony of Ards and county of Down, in Ireland: distant 94 Irish or 119 English miles from Dublin, seventeen English miles from Belfast; and twenty-one English miles from Portpatrick, on the opposite coast of Great Britain.

Donaghadee owes its rise to being the most convenient point of communication between the latest colonists of Ards, and their countrymen in Scotland, with whom they carried on a sufficient traffic to induce the proprietor, the Lord Montgomery, about A. D. 1650, to erect a quay 128 yards in length, and from 21 to 22 feet broad, which continued during the last century to afford pretty good shelter to all the craft employed. The Scottish mails have landed here since before 1744, at which time Donaghadee enjoyed a large share of the imports and exports of this part of the country. The accommodation of the old quay being latterly found insufficient for the better class of steam-packets, as well as for merchantmen, which frequently experienced the want of an asylum harbour on this coast, a new pier was commenced at the expense of government, which is now completed, enclosing a basin of seven acres, and calculated to hold sixty vessels of the larger class. The expense has been upwards of 150,000*l.*, and the work is executed in the best manner; but the benefits so far derived from it are not considered commensurate with so great a cost. The town, which consists of two principal streets, is well built and airy: it has at present a considerable export trade in cattle and grain, and a large import of coal. There are a handsome church, two Presbyterian meeting-houses, two Seceders' meeting-houses, and one Wesleyan Methodist meeting-house.

On the north-east side of the town stands a remarkable artificial mound or rath, surrounded by a dry fosse from 27 to 32 feet broad. The circumference of the mound at the bottom is 480 feet, at the top 219 feet, and its greatest conical height 140 feet. A powder magazine has been built on the summit, from which Scotland and the Isle of Man are visible in fair weather.

In 1834 there were in the parish 15 schools, educating 703 young persons: of these schools three were in connexion with the Board of National Education. Population of town in 1821, 2,795; in 1831, 2,986. (*Harris's History of the County of Down; Northern Tourist; Reports, &c.*)

DONATELLO. Donato di Belto di Bardo, called Donatello, was born at Florence in the year 1383. He was brought up in the house of a Florentine gentleman named Ruberto Martelli, a liberal patron of the arts, and received his first instructions from Lorenzo Bicci, from whom he learned painting in fresco; but he afterwards became more famous as a sculptor. He also practised architecture. In the course of his life he visited many towns of Italy, among which were Venice and Padua, where the people wanted to detain and naturalize him, and Rome. Donatello was much esteemed by his contemporaries, and executed a great number of works, both in private and public buildings, and for the grand-duke Cosmo I. He was the first to employ bas-relief in telling stories, according to the more elaborate style of Italian sculpture. He died paralytic, December 13, 1466.

When he first became so infirm as to be unable to work, the grand-duke Piero I. gave him a small estate: but he was so much annoyed by the troublesome references of his labourers, that he insisted on relinquishing it; and Piero gave him a pension instead, in daily payments, which perfectly contented him. Some relations visited him one day, for the purpose of persuading him to leave them at his death a vineyard which he owned; but he answered, that it seemed more reasonable to leave it to the peasant who had always worked upon it than to those who had done no labours for him, except paying him that visit: and he did so.

His principal works are at Florence; but some have decayed, or been removed from their original station. One, a figure of St. Mark, which was nicknamed (according to the common propensity of the Florentines) *Lo Zuccone* (the Gourd) on account of its bald head, is much commended. A St. George is also much esteemed; and Vasari, speaking of a Judith bearing the head of Holofernes, in bronze, calls it, with all the strength he gathered from his intense love of his art, 'A work of great excellence and mastery, which, to him who considers the simplicity of the outside, in the drapery and in the aspect of Judith, seems manifested from within it the great heart (animo) of that woman and the aid of God; as in the air of that Holofernes, wine and sleep, and death in his members, which, having lost their spirit, show themselves cold and falling.'

Donatello left several pupils, to whom he bequeathed his tools. The most noted are Bertoldo, Nanni d'Anton di Bianco, Rossellino, Disederio, and Vellano di Padova. To the last he left all the works which he retained at his death. (Vasari; Baldinucci.)

DONATIO MORTIS CAUSA (Law), a gift made in prospect of death. The doctrine is derived from the civil law, and a donation of this kind is defined in the Institutes (lib. ii., tit. 7) as 'a gift which is made under an apprehension of death, as when a thing is given upon condition that, if the donor die, the donee shall have it, or that the thing given shall be returned if the donor shall survive the danger which he apprehends, or shall repent that he has made the gift; or if the donee shall die before the donor.' In the English law it is necessary to the validity of this gift that it be made by the donor with relation to his dying by the illness which affects him at the time of the gift, but it takes effect only in case he die of that illness. There must be a delivery of the thing itself to the donee; but in cases where actual transfer is impossible, as, for instance, goods of bulk deposited in a warehouse, the delivery of the key of the warehouse is effectual. A donatio mortis causa partakes of the nature of a legacy so far as to be liable to the debts of the donor, and, by 36 Geo. III., c. 52, § 7, to the legacy duty; but as it takes effect from the delivery, and not by a testamentary act, it is not within the jurisdiction of the ecclesiastical

court, and neither probate or administration is necessary, nor the assent of the executors, as in the case of a legacy.

On the Roman donatio mortis causa the reader may consult Heineccius, *Op.*, tom. vi., p. 581, and the references there given; and the Pandect, xxxix., tit. 6. The Constitution of Justinian put donations mortis causa very nearly on the footing of legacies in the Roman law.

As to the English law, see Roper on *Legacies*, vol. i.

DONATISTS, Christian schismatics of Africa, of the fourth century, originally partisans of Donatus, bishop of Casa Nigra in Numidia, the great opponent to the election of Cecilianus into the bishopric of Carthage. Donatus accused Cecilianus of having delivered up the sacred books to the Pagans, and pretended that his election was thereby void, and all those who adhered to him heretics. Under this false pretext of zeal he set up for the head of a party, and, about the year 312, taught that baptism administered by heretics was ineffectual; that the church was not infallible; that it had erred in his time; and that he was to be the restorer of it. But a council held at Arles, in 314, acquitted Cecilianus, and declared his election valid. The schismatics, irritated at the decision, refused to acquiesce in the sentence of the council; and the better to support their cause, they thought it proper to subscribe to the opinions of Donatus, and openly to declaim against the Catholics. They gave out that the church was become prostituted; they re-baptized the Catholics; trod under foot the hosts consecrated by priests attached to the Holy See; burned their churches; and committed various other acts of violence. They had chosen into the place of Cecilianus one Majorinus, but he dying soon after, they brought in another Donatus, different from him of Casa Nigra, as bishop of Carthage.

It was from this new head of the cabal, who used so much violence against the Catholics, that the Donatists are believed to have received their name. As they could not prove, however, that they composed a true church, they bethought themselves of sending one of their bishops to Rome. They attempted likewise to send some bishops into Spain, that they might say their church began to spread itself everywhere.

After many ineffectual efforts to crush this schism, the emperor Honorius ordered a council of bishops to assemble at Carthage in the year 410, where a disputation was held between seven of each party, when it was decided that the laws enacted against heretics had force against the Donatists. The glory of their defeat was due to St. Augustine, bishop of Hippo, who bore the principal part in this controversy. The Donatists, however, continued as a separate body, and attempted to multiply their sect even in the sixth century; but the Catholic bishops used so much wisdom and prudence that they insensibly brought over most of those who had strayed from the bosom of the church. The church of the Donatists gradually dwindled to nothing, and became quite extinct in the seventh century. (Broughton's *Dict. of all Religions*, fol. Lond., 1756, pp. 340, 341; Mosheim's *Ecc. History*, 4to. Lond., 1765, vol. i., pp. 211, 214, 259, 305; Moreri, *Dict. Historique*, fol., Paris, 1759, tom. iv. p. 214.)

DONATIVE. [*BENEFICE*, vol. iv., p. 220.]

DONATUS, AILIUS, a celebrated grammarian, who lived in the middle of the fourth century. He wrote a Grammar, which long continued in the schools; and also Notes upon Terence and Virgil. He was most eminent in the time of Constantius, and taught rhetoric and polite literature at Rome in the year 356, about which time St. Jerom studied grammar under him. Donatus has given ample employment to the bibliographers, who all speak of an 'Editio Tabellaris sine ulla nota' of his Grammar, as one of the first efforts at printing by means of letters cut on wooden blocks. (See Meerman, *Origines Typograph.* of this and other editions, 4to., Hag. Com. 1765, tom. i. pp. 126, 132; ii. pp. 107, 215, 218.) This Grammar has been printed with several titles, as 'Donatus,' 'Donatus Minor,' 'Donatus Ethimolvsatus,' 'Donatus pro puerulis,' &c., but the work is the same, namely, 'Elements of the Latin Language for the use of Children.' In the volume of the *Grammatici Veteres*, printed by Nic. Jenson, without date, it is entitled 'Donatus de Barbarismo et de octo partibus Orationis.' Dr. Clarke, in his 'Bibliographical Dictionary,' vol. iii. p. 144-148, has given a long list of editions of Donatus, to which the more inquisitive reader is referred. Donatus's 'Commentarii in quinque Comœdias Terentii,' were first printed without date.

probably before 1460, and reprinted in 1471 and 1476. The 'Commentarius in Virgilium,' fol. Ven., 1529, though ascribed to him, is thought by many not to be his.

Donat, in the middle ages, both in English and French, became a synonym for any system of grammar: as in Piers Plowman—

'Then drave I me among drapers my Donet to lerne.'

In the statutes of Winchester College, written about 1386, grammar is called 'Antiquus Donatus,' the old Donat. Cotgrave quotes an old French proverb, 'Les Diables estoient encores en leur Donat,' the devils were but yet in their grammar. (See Harles, *Introd. in Hist. Ling. Latinæ*, 8vo., Bremæ, 1773, pp. 202, 203; Clarke, *Bibliogr. Dict.*, ut supra; Warton's *Hist. Eng. Poet.*, 4to., vol. i. p. 281; Chalmers's *Biogr. Dict.*, vol. xii. p. 241.)

DONAX. [CONCHACEA, vol. viii., p. 428.]

DONCASTER, a market-town, borough, and parish in the West Riding of the county of York, in the wapentake of Strafforth and Tickhill. It is situated on the river Don, on the great north road, which passes through the whole length of the town; it is 162 miles north-north-west of London, and 37 miles south-by-west of York. Doncaster was the *Danum* of Antoninus, and was called *Dona Ceastre* by the Saxons, from which its present name is derived. Doncaster is one of the cleanest, most airy, and most beautiful towns in the kingdom. The approach from London, by a wide and nearly level road, ornamented with antient elm-trees, is magnificent. The town stands on the Watling-street of the Romans. Coins, urns, and other Roman remains are occasionally dug up in various parts of the town and neighbourhood.

Under the Municipal Reform Act the borough is divided into three wards, with six aldermen and eighteen councillors; it has also a commission of the peace. The clear income of the corporation is about 8000*l.* per annum, of which large sums are expended in lighting, paving, cleaning, and watching the town, in repair of roads, improvement of the estates, police expenses, and in contributions to various charities. The air is considered remarkably pure and salubrious, and this circumstance, combined with its advantageous situation and its comparative freedom from local assessments, renders it a desirable residence for persons of limited income. The population of the borough was, in 1801, 5697; in 1811, 6935; in 1821, 8544; in 1831, 10,030. The population of the townships in the soke of Doncaster, including Hexthorpe-with-Balby, Loversal, Ros-sington, Aukley, Blaxton, and Wheatley-with-Sandall, was, in 1831, 1700.

Doncaster has a few iron foundries, a sacking and a linen manufactory on a small scale. In 1787, Dr. Cartwright introduced the manufacture of muslins by power-looms, of which he was the inventor, into the town; but the attempt to make Doncaster a manufacturing town was unsuccessful. As the centre of a large agricultural district, the markets and fairs are attended by a large rural population, who contribute greatly to its support. Although it is one of the largest corn-markets in the kingdom, there is no corn-exchange; a spacious area between the shambles and the cattle-market is used for the sale of corn. The town also derives support from the numerous opulent families residing in its vicinity, and from the continual intercourse on the north road. Though the navigation of the Don renders it an eligible situation for general traffic between the manufacturing districts and the eastern coast, no advantage has yet been taken of the facilities thus afforded for making it a place of trade.

The public buildings in Doncaster are the mansion-house, a handsome structure, which has cost about 10,000*l.*, and which is used for the meetings of the corporation, for concerts, assemblies, and occasionally for public meetings; the town-hall, in which the quarterly sessions for the borough and the annual sessions for the wapentake are held; the gaol, which is built on the improved principle for the classification of prisoners, a betting-room, and a theatre. The stand, on the race-ground, may also be considered as one of the public buildings; it was erected at the expense of the corporation, and is both elegant and commodious. The stand tickets sold during the race week produce an income of about 1700*l.* a year. The churches of Doncaster are, the parish church, dedicated to St. George, and Christ Church. The former is a spacious and elegant cruciform structure, with a fine square tower, 141 feet high. The various details of the exterior and interior are particularly fine, and well

deserving of the attention of the antiquary. Christ Church was erected a few years ago, from a fund left for that purpose by the late John Jarratt, Esq. The spire was 160 feet high; in November, 1836, it was struck by lightning, the tower was much injured, and that part of the edifice is at present (May, 1837) a mass of ruins. The interior is uninjured, and the service has not been interrupted by the accident. The living of the parish church is a vicarage, in the archdeaconry and diocese of York, and in the patronage of the archbishop of York. Christ Church is a perpetual curacy, in the gift of the trustees of the late Mr. Jarratt. The dissenting places of worship are for Friends, Methodists, Independents, Catholics, and Presbyterians.

The educational establishments are numerous. There are many boarding-schools for both sexes, a grammar-school, a national-school, a British-school, and six Sunday-schools. All these schools are well supported. The number of pupils instructed in Sunday-schools exceeds 1000; they are taught by 150 teachers and superintendents. The Yorkshire institution for the Deaf and Dumb is situated near the race-course: it is a school of instruction and industry. (DEAF and DUMB.) Other institutions are the Subscription Library, the Mechanics' and Apprentices' Library, and the Lyceum Literary and Scientific Society. A valuable library also belongs to the church, which is accessible to all the inhabitants. The public charities which belong to the town are numerous. St. Thomas's Hospital, endowed in 1588 by Thomas Ellis, is an asylum for six "poore and decayed housekeepers of good name and fame." Its present income is 335*l.* 3*s.* 6*d.* a year. Quintin Kay's charity of 300*l.* per annum, is chiefly devoted to the relief of poor and reduced persons, and to the apprenticing of six poor children to mechanical or handicraft trades. Jarratt's charity is for the relief of six reduced housekeepers. There are several other bequests for purposes similar to those enumerated. The other charities in Doncaster are the dispensary, the lying-in, clothing, sick, and soup charities. The total number of accounts kept at the Doncaster savings' bank to November 1836 was 2050, amounting to 81,711*l.* 9*s.* 6*d.*

The races at Doncaster are held in the third week of September, and continue for five days. It is said that they are a source of great emolument to the town, but this is very doubtful. It is certain that they are productive of great immorality, not only among the casual visitors, but also among the permanent residents. The race-ground, which is about a mile from the town, is perhaps unrivalled. The St. Leger stakes excite great interest not only throughout the kingdom, but in all parts of the world. The municipal body subscribes largely to the maintenance of the races, under the idea that they tend to the prosperity of the town. Pottery Car, on the south of Doncaster, was a morass of many miles in extent, till the year 1766. It is now completely drained, and yields luxuriant crops.

DONEGAL, a maritime county of the province of Ulster in Ireland; bounded east and south on the inland side by parts of the counties of Londonderry, Tyrone, Fermanagh, and Leitrim; and on the south-west, west, and north, by the Atlantic Ocean. Greatest length from Inishowen head on the north-east, to Malin Beg head (sometimes called Teelin head,) on the south-west, 85 statute miles; greatest breadth from Fearn-hill on the south-east to Horn Head on the north-west, 41 statute miles. Area according to Ordnance survey of Ireland, consists of—

| | | | |
|-------|-----------|---|----|
| Land | 1,170,335 | 2 | 31 |
| Water | 23,107 | 0 | 11 |

Total 1,193,442 3 2 Statute measure.

Or, about 1865 square miles.

Gross population in 1831, 289,149.

Donegal forms the north-western extremity of Ireland. The inland boundary preserves a general direction of south-west by north-east, and from Lifford northward is formed by the navigable river and harbour of Loch Foyle. The maritime boundary is extremely irregular, being deeply indented on the north by the æstuaries of Loch Swilly, Mulroy, and Sheephaven, and on the south by Donegal bay. The whole county is uneven and mountainous, with the exception of the midland district extending from the liberties of Londonderry westward to Letterkenny and Rathmelton, on Loch Swilly, and southward along the Foyle to Lifford and Castle Finn and some other incon-

siderable tracts around Ballyshannon and Donegal on the south, and Dunfanaghy and Buncrana on the north. The mountain groups of Donegal together with the highlands of Tyrone and Derry present a deeply withdrawn amphitheatre to the north-east, enclosing the basin of the Foyle. That portion of the mountainous circuit which lies within this county is broken only in the north by the openings of Loch Swilly and Mulroy Bay; and on the south (where the connecting highlands of Donegal and Tyrone are narrowed between the valley of the Finn and the Bay of Donegal) by the gap of Barnesmore. Slieve Snaght, which rises to a height of 2019 feet in the centre of the peninsula of Inishowen, forms the extremity of this chain on the north. Westward from Slieve Snaght and similarly situated in the centre of the peninsula of Fanad between Loch Swilly and Mulroy Bay, is Knockalla (1196 feet); backed in like manner by Loch Salt mountain (1541 feet), between the head of Mulroy Bay and the low country stretching inland from Sheep Haven. Westward again from the Sheep Haven is Muckish, 2190 feet in height, which slopes down on the north to the promontory of Horn Head; and Carntreena, (1396 feet), which extends to the sea at Bloody Foreland. Southward from Muckish stretches a vast region of highlands, which expands towards the west in wide-extended tracts of bog, interspersed with small lakes and covered with black heaths down to the sandy beach of the Atlantic: on the east it presents a series of bold continuous eminences overhanging the basin of the Foyle. The chief eminences of the chain are Erigal and Dooish on the north, the first 2462 feet in height (the highest ground in the county), the second 2143 feet; and Bluestack and Silverhill on the south, 2213 and 1967 feet respectively. From Bluestack extends a series of considerable elevations westward, along the northern boundary of the bay of Donegal, which terminate in the precipices of Slieve League, and the promontory of Malin Beg; the Barnesmore mountains sweeping eastward continue the chain into Tyrone. This mountainous tract covers upwards of 700 square miles, or more than twice the area of the county of Carlo. It contains several spots of great interest to the tourist; such as Loch Salt, the prospect from which over Horn Head and Tory Island has been justly celebrated, and Glen Veagh, under the eastern declivity of Dooish, where cliffs of 1000 feet hang for upwards of two miles over a glen and lake; the opposite bank being clothed with a natural forest which is still the retreat of the red deer.

From the liberties of Londonderry northward, the coast of Loch Foyle between the mountains of Inishowen and the sea, is well inhabited and improved. Muff, close to the county boundary, and Moville, near the mouth of the Loch, are much frequented, the latter especially by the citizens of Derry during the bathing season. From Inishowen Head at the entrance of Loch Foyle, the coast, which from this point is very rocky and precipitous, bends north-west to Malin Head, the most northern point of this county and of Ireland. The cliffs at Inishowen Head are 313 feet in height: at Bin Head, about half-way between Culdaff and Malin, they rise to the altitude of 814 feet above the sea. On the Loch Swilly side of the peninsula the coast is low, and in many places covered with sand, which the north-westerly gales heap up in immense quantities on all the exposed beaches of this coast. Loch Swilly extends inland upwards of twenty miles, and forms a spacious and secure harbour: the average breadth is about one mile and a half, and the inner basin is completely land-locked; but the vicinity of Loch Foyle, which floats vessels of 900 tons up to the bridge of Derry, renders Loch Swilly of less importance as a harbour. On the river Swilly, a little above its entrance into the Loch, stands Letterkenny, a thriving town, which supplies most of the country to the westward with articles of import. Rathmelton, and Rathmullen are situated on the western shore of the Loch, the latter nearly opposite Buncrana, and all in the midst of well improved vicinities. The rise of spring tides opposite Buncrana is 18 feet. Westward from Loch Swilly, the coast of Fanad, which is peninsulated by the Bay of Mulroy, is very rugged, and in many parts overspread with sand blown in between the higher points of rock. The Bay of Mulroy is encumbered with sandbanks and intricate windings: it extends inland upwards of ten miles, and is completely land-locked, being scarcely half a quarter of a mile wide at the entrance. The small peninsula of Rosguill intercepted between this bay and Sheep Haven, has been almost obliterated by the sands which have been

blown in here within the last century. Rosapenna-house, built by Lord Boyne, on the neck of the isthmus, with all its demesne, gardens, and offices, has been buried to such a depth, that the chimneys of the mansion-house some years since were all that was visible. On the opposite shore of Sheep Haven stand Doe Castle, and the house and demesne of Ardes, the most remote, and at the same time the most splendid seat in this quarter of Ulster. On a creek of Sheep Haven is the little port-town of Dunfanaghy, immediately under Horn Head, which rises north of it to the height of 833 feet, with a cliff to the ocean of 626 feet. On the western side of Horn Head is a perforation of the rock, known as Mc Swine's Gun: when the wind sets in from the north-west, the sea is driven into this cavern with such violence as to rise through an opening of the rock above in lofty jets, with a report which, it is said, may be heard at a distance of many miles. In the sound between Horn Head and Bloody Foreland are the islands of Innisboffin, Innishadoony, and Tory Island, which last is at a distance of eight miles from the shore. Tory Island is three miles and a half in length, by half a mile to three quarters in breadth, and is inhabited by perhaps the most primitive race of people in the United Kingdom. In 1821 the island contained 59 houses and 296 inhabitants, few of whom had ever been on the main land. It is stated by the only tourist who has given an account of his travels through this remote district, that seven or eight of the inhabitants of Tory having been driven by stress of weather into Ardes Bay about the year 1825, 'Mr. Stewart of Ardes, gave these poor people shelter in a large barn, and supplied them with plenty of food and fresh straw to lie on;—not one of these people was ever in Ireland before; the trees of Ardes actually astonished them—they were seen putting leaves and small branches in their pockets to show on their return. Mr. Stewart had the good nature to procure a piper for their amusement, and all the time the wind was contrary those harmless people continued dancing, singing, eating, and sleeping—a picture of savage life in every age and clime.' (*Sketches in Ireland* by the Rev. Cæsar Otway, p. 13.) The average elevation of the western part of the island is no more than from 50 to 60 feet above the level of the sea, and the want of shelter is felt very severely in those north-westerly gales which set in with such violence on this coast. In the summer of 1826, it is said, a gale from this quarter drove the sea in immense waves over the whole flat part of the island, destroying the corn and washing the potatoes out of the furrows.

From Bloody Foreland south to Malin Beg Head, a distance of 40 miles in a straight line, nothing can be more desolate than the aspect of the western coast of Donegal. Vast moors studded with pools of bog water descend to the Atlantic between barren deltas of sand, through which each river and rivulet of the coast winds its way to the sea. In winter when these sandy channels are overflowed, it is impossible to proceed by the coast line, as there are no bridges over any of the larger streams north of the village of Glenties. The wildest part of this district is called the Rosses, in which the village of Dunglo or Cloghanlea containing, in 1821, 253 inhabitants, is the principal place. A great number of islands lie off this coast separated from the main-land, and from one another by narrow sounds and sand-banks. Of these, eleven are inhabited; of which the principal are Aranmore, or the north Island of Aran, containing in 1821, 132 houses, and 788 inhabitants; Rutland or Innismacduirn, containing 29 houses, and 173 inhabitants; Innisfree, containing 25 houses, and 171 inhabitants; and Owey, containing 12 houses and 76 inhabitants. The cause of so dense a population in this desolate country is the success of the herring fishing here in 1784 and 1785, when each winter's fishing was calculated to have produced to the inhabitants of the Rosses a sum of 40,000*l.*, who loaded with herrings upwards of 300 vessels in each of these years. These successes induced the government, in conjunction with the Marquis of Conyngham the proprietor, to expend, it is said, 50,000*l.* in the improvements necessary to erect a permanent fishing station on the island of Innismacduirn. A small town was built and called Rutland, but it was scarcely completed when the herrings began to desert the coast; at the same time the sands began to blow, and have since continued to accumulate to such a degree that at present the island is nearly half covered, and the fishing station quite obliterated. Below high-water mark on the coast of Innisfree,

grows a marine grass peculiarly sweet and nutritive for cattle, which watch the ebb of the tide and feed upon it at every low water.

The district of the Rosses is separated from the more reclaimed country about Glenties and Ardara, on the south by the river Gweebarra, the sandy channel of which is from a mile and a half to a quarter of a mile in breadth throughout the last eight miles of its course, and can only be passed by fording in dry weather. On the whole line of coast from Bloody Foreland to Malin Beg Head there is but one gentleman's seat: this is at Ardara, a village at the head of Loughrosmore Bay, from which there is a pretty good communication over the heights that stretch from Bluestack to Malin Beg, with Killybeggs and Donegal. Westward from Ardara, the coast again becomes precipitous, being lined with cliffs from 500 to 600 feet in height on the northern side of the great promontory terminated by Malin Beg Head. The loftiest cliffs, however, on the whole line of coast are those of Slieve League immediately east of Malin Beg, where the height from the sea to the summit of the shelving rock above is at one point 1964 feet. Eastward from Slieve League to the town of Donegal, the northern shore of Donegal Bay affords excellent shelter from the north-west gales in the successive creeks of Teelin Bay, Fintragh Bay, Killybeggs Bay, Mc Swine's Bay, and Inver Bay. Of these the harbour of Killybeggs is by much the most sheltered and commodious, being the only one secure from a gale from the west or south-west. The harbour of Donegal itself at the head of the bay is sufficiently good for a much more trading place; and ten miles south from it is the embouchure of the navigable river Erne, which flows from Loch Erne through Ballyshannon. [BALLYSHANNON.] Four miles from Ballyshannon on the coast, at the junction of the counties of Donegal and Leitrim, is Bundoran, a fashionable watering-place, much frequented by the gentry of the neighbouring counties. Round the head of Donegal Bay from Killybeggs to Bundoran, cultivation extends more or less up all the seaward declivities: the neighbourhood of Ballyshannon is well improved; and north-east from the town of Donegal a good tract of arable land stretches inland to the picturesque lake of Loch Eask, and the Gap of Barnesmore, where a mountain defile about seven miles in length connects it with the south-western extremity of the district of the Foyle at Ballybofey and Stranorlar, two thriving villages on the Finn.

The Finn, which is the chief feeder of the Foyle on this side, issues from a lake 438 feet above the level of the sea, situated in the centre of the mountain chain extending south from Erigal, and after a course of about thirty miles eastward, joins the Foyle at Lifford bridge, eight miles below Castlefinn, where it is navigable for boats of 14 tons. Other feeders of the Foyle, out of Donegal, are the Derg, which comes from Loch Derg in the south-east extremity of the county of Donegal and joins the main stream in Tyrone; the Deele, which has a course nearly parallel to the Finn, and descends upwards of 800 feet in its course from Loch Deele to the Foyle, which it joins a mile below Lifford; and the Swilly burn or brook, which passes by Raphoe, and is navigable for a few miles above its junction. Loch Derg is about 24 miles wide each way, and surrounded on all sides except the south by steep and barren mountains: it is 467 feet above the level of the sea, and its greatest depth is 75 feet. This lake is subject to violent gusts of wind. It abounds in excellent trout. The Swilly river, although it has a course of little more than fifteen miles, brings down a good body of water through Letterkenny to Loch Swilly. The Leannan river, which likewise flows into Loch Swilly by Rathmilton, is a considerable stream, as is also the Lackagh, which discharges the waters of the lakes of Gartan, Loch Veagh, Loch Salt, and Glen Loch into Sheep Haven. The waters of Loch Salt, which is perhaps the deepest pool in Ireland, descend 731 feet in a course of little more than three miles to Glen Loch. Of the rivers of the western coast the chief is the Gweebarra, already mentioned: of a similar character is the Gweedore, which separates the Rosses on the north from the district of Cloghanealy. The Owenaa, which flows through Ardara, is the only other considerable river on this coast; the minor streams issuing from small lakes, and the torrents which descend from the moors in winter, are almost innumerable.

The general direction of all the valleys which intersect the highlands of Donegal is north-east and south-west, and

this natural disposition marks out the three chief lines of mountain road; viz., from Ballyshannon and Donegal to Lifford and Londonderry, through the gap of Barnesmore; from Ardara to Lifford and Letterkenny, by the head of the Finn; and from Dunfanaghy and the cultivated country about Sheep Haven into the Rosses, by the passes between Dooish and Erigal. These latter roads are little frequented, so that west of Enniskillen the gap of Barnesmore is the only ordinary communication between Connaught and Ulster. The district along the Foyle and round the head of Loch Swilly is as well supplied with means of communication by land and water as any other part of Ireland. Throughout the county the roads are good.

The climate of Donegal is raw and boisterous, except in the sheltered country along the Foyle. The prevalent winds are from the west and north-west, and the violence with which they blow may be estimated from the effects of the storm of December 4, 1811, in which His Majesty's ship *Salhander* was lost in Loch Swilly. The maws and gills of all the fish cast on shore—eels, cod, haddock, lobsters, &c.—were filled with sand; from which it would appear, that by the furious agitation of the sea, the sand became so blended with it, that the fish were suffocated. Eels are fished in fifteen fathoms, and cod in twenty to thirty; hence making allowance for their approach nearer shore before the storm, we may judge of the depth to which the agitation of the water descended: the ordinary depth in a gale of wind is seven feet below the surface, and in a heavy storm twelve to fourteen feet. (*Geological Transactions*, iii. c. 13.) From the remains of natural forests in many situations where no timber will at present rise against the north-west blast, it has been inferred that the climate is now more severe than it formerly was, a conjecture which would seem to be corroborated by numerous ruins of churches and houses, overwhelmed by sand blown in on situations where, had such events been common at the time of their foundation, no one would have ventured on building. The deposit of sand at the bottom of the sea is daily increased by the detritus of loose primitive rock brought down by every river of the coast; so that with each succeeding storm a greater quantity may be expected to be blown in, until the whole coast becomes one sandy desert, unless the danger be obviated by timely plantations of bent grass and the extirpation of those multitudes of rabbits whose burrows now extend, in many places, for several miles along the shore, and prevent the natural grasses from binding down the loose matter.

The Floetz limestone-field, which occupies the central plain of Ireland, extends over the borders of this county from Bundoran, where the limestone cliff rises to the height of 100 feet over the Atlantic, ten miles north-east to Balintra, where the extreme edge of the stratum is perforated by a subterraneous river. Limestone gravel is also found along the flanks of the primitive district as far as some miles north of Donegal town, and to the presence of this valuable substance may be chiefly attributed the cultivation which distinguishes this part of the county from the sterile tract that separates it from the basin of the Foyle. From the mountains of Barnesmore, north, the whole formation of this county, with the exception of the transition tract along the basin of the Foyle, is primitive.

The prevalent rocks are granite and mica slate, passing into gneiss, quartz slate, and clay slate. The granite is a coarse granular syenite, the detritus of which gives a strong reddish tinge to the sands washed down by the streams that traverse it. It occurs supporting flanks of mica-slate along the whole line of mountains from Loch Salt to Barnesmore. On the eastern flanks of this range the mica slate passes into greywacke, which forms the substratum of the valley of the Foyle: the same rock occurs over the lower parts of Inishowen, and also appears on the southern side of the range near Donegal town. Granular limestone is found in beds throughout the whole mountain district in great quantity and variety of colour, as among various other indications, grey at Malin Head; greyish-blue at Loch Salt; fine granular, pearl-white, pearl-grey, flesh-red, and bright bluish-grey, at the marble hill near Muckish; yellowish-white, greyish-white, and rose-red, at Ballymore; pearl-white and pale rose colour at Dunlewy, under Erigal; pearl-grey in extensive beds at the head of the river Finn; and greyish fine blue at Killybeggs. Siliceous, magnesian, and marly limestone also occur in various parts of the baronies of Inishowen and Raphoe, with a remarkable

steatite near Convo, on the Deele, which cuts under the knife like wood, and is used by the country people for the bowls of tobacco-pipes. Beds of greenstone and greenstone porphyry are sometimes found resting on the deposits of granular limestone, and occasionally on the mica slate and granite, and the dikes from which these originate may be seen traversing the primitive rock at Horn Head and Bloody Foreland. Among the rarer minerals occurring in this remarkable region are columnar idocrase, malacolithe, epidote, and essonite (cinnamon stone), from a bed of mica slate in the Rosses, and from the bar of the Gwecharra river; garnet in hornblende slate over the marble of Dunlewy; and cherry-red garnet from Glenties: also plumbago from the shore of Ardes; copper pyrites from Horn Head; lead earth and iron ochre from Kildrum, in Cloghanealy; pearl-grey and yellowish-white porcelain clay from Aranmore Island; potter's clay from Drumardagh, on Loch Swilly; iron pyrites from Barnesmore; lead ore from Fintown, Letterkenny, Glenties, and various other places; and pipe-clay from Drumboe, near Stranorlar. The white marble of Dunlewy, near the mountain Enigal, is stated to be of an excellent quality, and its bed very extensive; it has been traced over a space of half a mile square, and is so finely granular, that it may be employed in the nicest works of sculpture. 'Its texture and whiteness,' says Mr. Griffith, 'approach more to those of the Parian than of the Carrara marble. It is very well known that perfect blocks of the Carrara marble are procured with great difficulty, and I firmly believe that the marble of Dunlewy is free from mica, quartz, grains, and other substances interfering with the chisel, which so frequently disappoint the artists who work upon the marble from Carrara.' A large supply of fine siliceous sand was formerly drawn from the mountain of Muckish by the glass-houses of Belfast, and considerable quantities have been of late exported to Dunbarton for the manufacture of plate and crown glass: the sand is rolled down the hill in canvas bags.

The soil of the primitive district is generally cold, moory, and thin. The limestone tract from Ballyshannon to Donegal is covered with a warm friable soil, varying from a deep rich mould to a light-brown gravelly earth. The soil of the transition district, arising chiefly from the decomposition of slaty rock, is a light but manageable clay, which is very well adapted for crops of potatoes, flax, oats, and barley, and in some situations, as along the rivers Finn and Boyle, bears wheat abundantly. The ordinary rotation of crops in the limestone district is potatoes, oats, or on the sea-coast, barley, and flax: on the cold lands of the western coast potatoes and barley, and among the mountains, potatoes and oats. Alternate green crops and house-feeding have been practised by some of the leading gentlemen farmers since before 1800, but the practice is not general. The loy, or one-sided spade, and old wooden plough, are still in common use in the highland districts. Donegal is not a grazing country; the good land is almost all under tillage; and the grasses of the remainder are generally too sour for feeding. Cattle grazing on the mountain districts are liable to two diseases, the *cruppan* or crippling, and *galar* or bloody urine, which are said to alternate as the cattle are removed from the higher to the lower pastures: horses are not subject to these diseases. The Raphoe and Tyrhugh farming societies originated about A. D. 1800, and have seen of some service in the encouragement of green crops and nurseries. The principal plantations are at Ardes and Tyrrellan, a fine seat near Stranorlar, where Mr. Stewart, the proprietor, has a nursery of sixteen acres. Two thousand larch-trees, each measuring at nine feet from the butt, from two

feet to two feet ten inches in girth, are at present (April, 1837) for sale in the latter neighbourhood. This is the first home growth of timber offered for sale in Donegal. The trees have been grown on steep and poor land, and are good evidences of the capabilities of the waste lands of this county.

The linen manufacture is carried on to a very considerable extent, and is still increasing in the cultivated country about Raphoe and Lifford, and also in the neighbourhood of Ballyshannon. Bleachgreens are numerous in the neighbourhood of Stranorlar, but spinning by machinery has not yet been introduced. Strabane, in the county of Tyrone, within two miles of Lifford, is the principal linen market for the southern district: the sale here averages 500 pieces weekly. Londonderry and Letterkenny are the markets for the district to the north: the weekly sale in the former place is about 400, and in the latter about 120 pieces. The manufacture of stockings by hand formerly employed many females on the western coast, a pair of Boylagh knit woollen stockings selling for seven shillings, but the common wear of trousers has now taken away the demand. Burning kelp continues to be a profitable occupation along the coast. About the beginning of the present century private distillation was carried on to an immense extent all over this county, particularly in the baronies of Inishowen and Kilmacrenan: repeated baronial fines and the vigilance of the authorities have latterly checked the practice, but it still exists to some extent in the mountain districts. Considerable numbers of whales have from time to time been taken off this coast; but this, as well as the herring fishery, is now neglected. In 1802 there were but two flour mills in this county. There is an export of three to four thousand tons of corn annually from Letterkenny, and the remaining export of the county is from Londonderry. The condition of the peasantry in the south and west is not much better than that of the wretched inhabitants of northern Connaught: land is let exorbitantly high; 3*l.* 5*s.* per acre is paid in the neighbourhood of Donegal town, and 1*l.* and 18*s.* on the declivities of the mountain district. All the butter and eggs of the poorer farmers go to market to make up the rent, and buttermilk and potatoes constitute their diet. The traveller is much struck with the improved appearance of the peasantry north of the gap of Barnesmore; a ragged, rather than a whole coat,' says Mr. Inglis, vol. ii, p. 108, 'was now a rarity, and the clean and tidy appearance of the women and girls was equally a novel as it was an agreeable sight. The farm-houses too were of a superior order: most of the houses had inclosures and clumps of sheltering trees.' The majority of the population in this district is Protestant.

Donegal is divided into six baronies; Tyrhugh on the south, Bannagh and Boylagh on the west, Kilmacrenan on the north-west, Inishowen on the north-east, and Raphoe on the east and centre. Ballyshannon (pop. 3775), Killybegs (pop. 724), and Donegal (pop. 830), were erected into corporations in the reign of James I.: these corporations are now extinct. Lifford, which is the assize town of the county, is governed by a charter of the 27th February, 10th James I. This corporation still possesses some property, and has a court of record with jurisdiction to the amount of five marks, but no criminal jurisdiction. The vicinity of Strabane has prevented Lifford from increasing: the court-house and county gaol constitute the greater part of the town: pop. 1096. The other towns are Letterkenny, pop. 2168; Rathmelton, pop. 1783; Buncrana, pop. 1089; Ballybofey, pop. 874; and Stranorlar, pop. 641. Donegal is represented in the imperial parliament by two county members.

Table of Population.

| Date. | How ascertained. | No. of Houses. | No. of Families. | Families chiefly employed in Agriculture. | Families chiefly employed in Trade, Manufactures, and Handicraft. | Families not included in preceding classes. | Males. | Females. | Total. |
|-------|--------------------------------|----------------|------------------|---|---|---|---------|----------|---------|
| 1798 | Estimated by Dr. Beauport. | 23,531 | .. | .. | .. | .. | .. | .. | 140,000 |
| 1821 | Under Act 55 Geo. III. c. 120. | 44,890 | 48,030 | .. | .. | .. | 190,659 | 187,711 | 348,370 |
| 1831 | Under Act 1 Wm. IV. c. 19. | 50,171 | 59,799 | 38,178 | 7,304 | 7,357 | 141,845 | 147,284 | 289,149 |

The southern part of Donegal, down to the plantation of Ulster, was known as Tyrconnell, and was the patrimony of the O'Donnells, whose chief tributaries were the O'Boyles in Boylagh and the Rosses; the Mac Swines (Mac Suibhne) in Bannagh, Rosguill, and Fanad; and the O'Doghertys in Inishowen. Prior to the fifteenth century, Inishowen had

been in the possession of the Mac Loughlins, a family of the Kinel Owan or O'Neills. The most distinguished of the chieftains of Tyreconnell was Hugh O'Donnell, surnamed the Red, whose entrapment by Sir John Perrot, and subsequent imprisonment at Dublin as a hostage for the good conduct of his clan, caused much hostility against the government of Queen Elizabeth in this part of Ulster. O'Donnell, after more than three years' confinement, escaped, and with much risk made his way through the English pale and reached Dungannon, the residence of the disaffected earl of Tyrone. Here, it is supposed, the plan of the great rebellion, commencing with the attack on the fort of the Blackwater [BLACKWATER], was originally formed. From Dungannon he proceeded to Ballyshannon, the residence of his father, who immediately resigned the chieftainship into his hands. A council of the tribe was then held on Barnesmore mountain, the result of which was a sanguinary irruption into Connaught, which they wasted as far as Galway and Limerick. O'Donnell next turned his arms to the assistance of Tyrone, who had risen in rebellion, and was present at the battle of the Blackwater. His confederates, Maguire and O'Rourke, soon after obtained an equally signal victory over Sir Conyers Clifford, the governor of Connaught, whom they met in a pass of the Carlow mountains on his way to lay siege to Belleek.

O'Donnell next invaded Thomond, which he laid waste; but he soon after returned to oppose Sir Henry Dockwra, governor of Loch Foyle [LONDONDERRY], who had seized on his castle of Donegal in his absence, and had set up his cousin Neal Garv O'Donnell, who was in the queen's interest, as chieftain in his place. But the Spanish troops who had been sent by Philip II. to the assistance of the rebels, having landed at Kinsale [KINSALE] in the mean time (23rd of September, 1601), he was obliged to raise the siege of Donegal and march into Munster. Here having formed a junction with Tyrone (28rd of December), they attempted the relief of Kinsale, in which the Spanish auxiliaries were besieged by the lord deputy, but owing, it is said, to a dispute about precedence, their armies did not act in concert, and a total defeat was the consequence. O'Donnell then sailed for Spain, to solicit in person new succours from Philip. After spending a year and a half in fruitless negotiation, he was seized with fever and died at Valladolid, where he was interred with royal honours in the church of St. Francis. On the death of Hugh, Neal Garv having proved refractory, his cousin Rory O'Donnell was promoted to the chieftainship, and afterwards to the earldom of Tyreconnell, which produced an ineffectual rebellion on the part of Neal and his allies the Mac Swines; but on the 7th of May, 1607, a letter accusing Rory of having entered into a conspiracy with Tyrone, Maguire, O'Caran, and other Irish lords, was dropped in the council-chamber at Dublin Castle, in consequence of which it was judged expedient for him to accompany the flight of his alleged associates, who immediately went beyond seas. In the mean time a town had been walled in at Derry by Sir Henry Dockwra, who had also built a castle at Lifford for the control of Tyreconnell. The vicinity of an English garrison proved so unsatisfactory to the proprietor of Inishowen, Sir Cahir O'Dogherty, that on some vague assurances of aid from Spain, communicated by the exiled earls, he broke into open revolt May 1st, 1608, and having surprised Culmore and put the garrison to the sword, advanced on Derry next day, which he carried with little resistance and burned to the ground. He then fell back on Kilmacrenan, and took up a strong position on the rock of Doune, where he held out for five months until he was killed by a Scotch settler, who shot him as he leaned over the edge of the rock. O'Dogherty being thus slain in rebellion and the exiled earls attainted of high treason, Donegal, along with five other counties of Ulster, escheated to the crown. On the plantation, the district about Lifford was allotted to English undertakers, of whom the chief were Sir Ralph Bingley and Sir John Kingmill; the whole of Boyleagh and Bannagh was allotted to John Murray, Esq., and his sub-patentees; the district of Portlough to Scottish undertakers, of whom the chief were Sir John Stewart and Sir James Cunningham; the district of Kilmacrenan to servants and natives, of whom the chief were Sir William Stewart, Sir John Kingsmill, Sir George Marburie, Captain Henry Hart, Sir Mulmory Mac Swine, Mac Swine Banagh, Mac Swine Fanad, and Tirlagh Roe O'Boyle. In Inishowen Muff was granted to the Grocers' Hall. Letterkenny owes its origin

to Sir George Marburie, and Rathmeltun to Sir William Stewart. At the time of the plantation the old Irish were in a very uncivilized state: in many of the precincts those who were permitted to remain, still practised their barbarous method of ploughing by the tail at the time of Pynnar's survey. During the wars that succeeded the rebellion of 1641, the British of the district along the Foyle, called the Laggan forces, did excellent service in this and the adjoining counties. There were some few forfeitures among the proprietors of Irish descent at the time of the Act of Settlement. The forfeitures consequent on the war of the revolution of 1688 did not extend into Donegal. The last historical event connected with this county was the capture of the French fleet off Tory Island by Sir John B. Warren in 1798.

The most remarkable piece of antiquity in Donegal is the Grianan of Aileach, the palace of the northern Irish kings from the most remote antiquity down to the twelfth century. It stands on a small mountain 802 feet in height, near the head of Loch Swilly. The summit of the mountain, which commands a noble prospect, is surrounded by three concentric ramparts of earth intermixed with uncemented stones. The approach by an ancient paved road leads through these by a hollow way to a dun or stone fortress in the centre. This part of the work consists of a circular wall of Cyclopean architecture varying in breadth from 15 feet to 11 feet 6 inches, and at present about 6 feet high, enclosing an area of 77 feet 6 inches in diameter. The thickness of this wall is diminished at about 5 feet from the base by a terrace extending round the interior, from which there are flights of steps somewhat similar to those at Steague Fort, another remarkable Cyclopean erection in the county of Kerry. There was probably a succession of several such terraces before the upper part of the wall was demolished. Within the thickness of this wall, opening off the interior, are two galleries, 2 feet 2 inches wide at bottom and 1 foot 11 inches at top by 5 feet in height, which extend round one-half of the circumference on each side of the entrance doorway, with which however they do not communicate: their use has not been determined. The remains of a small oblong building of more recent date but of uncertain origin, occupy the centre. The space contained within the outer enclosure is about 5½ acres, within the second, about 4; within the third, about 1; and within the central building, or cashel, ½. The stones of the wall are generally of about 2 feet in length, polygonal, not laid in courses, nor chiselled, and without cement of any kind.

The description is thus minute, as, from an ancient Irish poem published in the first part of the 'Memoir of the Ordnance Survey of Ireland,' and which bears conclusive internal evidence of having been written before A.D. 1101, the building of Aileach ('the stone fortress') is attributed, with every appearance of accuracy, to Eochy Ollahit, whose reign is one of the very earliest historical epochs in Irish history. In this poem are preserved the names of the architects, the number of the ramparts, and the occasion of the undertaking. Until the publication of the Memoir, the uses and history of this remarkable edifice were totally unknown. It was reduced to its present state of ruin A.D. 1101, by Murtagh O'Brien, king of Munster, who, in revenge of the destruction of Kineora [CLARE] by Donnell Mac Loughlin, king of Ulster, A.D. 1088, invaded this district and caused a stone of the demolished fortress of Aileach to be brought to Limerick for every sack of plunder carried home by his soldiery. This event was remembered as late as 1599, when the plunder of Thomond by Hugh O'Donnell was looked on as a just retaliation. On Tory Island also are some Cyclopean remains, not improbably connected with the very ancient tradition of the glass tower mentioned by Nennius. Tory signifies the island of the tower. On the same island are also a round tower and the remains of seven churches and two stone crosses. Throughout the county are numerous memorials of St. Columba, as he is more usually known in Ireland, St. Columbkille. This distinguished saint, the apostle of the Picts and founder of the church of Iona, was born at Gartan, a small village south of Kilmacrenan, where he founded an abbey which was afterwards richly endowed by the O'Donnells. Near Kilmacrenan is the rock of Doune, on which the O'Donnell was always inaugurated. The remains of the abbey of Donegal still possess interest for the antiquarian, and on the north of Glen Veagh are some very ancient remains of churches. But by much the most celebrated ecclesiastical

locality in this county is the Purgatory of St. Patrick, situated on an island in Loch Derg. The antient purgatory was in high repute during the middle ages: the penitent was supposed to pass through ordeals and undergo temptations similar to those ascribed to the Egyptian mysteries. (See O'Sullivan, *Hist. Cathol. Hib.*) In Rymer's 'Fœdera,' are extant several safe conducts granted by the kings of England to foreigners desirous of visiting Loch Derg during the fourteenth century. On Patrick's day, A. D. 1497, the cave and buildings on the island were demolished by order of Pope Alexander VI., but were soon after repaired: they were again razed by Sir James Balfour and Sir William Stewart, who were commissioned for that purpose by the Irish government A. D. 1632. At this time the establishment consisted of an abbot and forty friars, and the daily resort of pilgrims averaged four hundred and fifty. The cave was again opened in the time of James II., and again closed in 1780. At present the Purgatory, which has been a fourth time set up, but on an island at a greater distance from the shore than the two former, draws an immense concourse of the lower orders of Roman Catholics from all parts of Ireland, and many from Great Britain and America every year. The establishment consists, during the time of the station from the 1st of June to the 15th of August, of twenty-four priests: the pilgrims remain there six or nine days; the penances consist of prayer, maceration, fasting, and a vigil of twenty-four hours in a sort of vault called the 'prison.' The fees are 1s. 4d. each, of which 6d. is paid for the ferry. During the time the pilgrims remain on the island they are not permitted to eat anything but oatmeal bread and water. Water warmed in a large boiler on the island is given to those who are faint; this hot water is called 'wine,' and is supposed to possess many virtues. One of the pilgrims whom Mr. Inglis saw here, had her lips covered with blisters from the heat of the 'wine' she had drank. The number of pilgrims is variously estimated from 10,000 to 13,000 and 19,000 annually, and is at present on the increase. A station was advertised here in the year 1830 by a Roman Catholic bishop.

For the state of education in this county, see RAPHAEL, with which diocese the county of Donegal is nearly co-extensive.

The only newspaper published in this county is the Ballyshannon Herald; number of stamps used in 1835, 7185.

The county expenses are defrayed by Grand Jury presentments. The amount of direct taxation averages about 24,000*l.* per annum. Assizes are held twice a year at Lifford, where there is a county gaol: there are bridewells at Donegal and Letterkenny. The district lunatic asylum is at Londonderry. The share of the expense of erecting this establishment, which falls on Donegal, is 905*l.* 10*s.* 1*d.*

(*Statistical Survey of Donegal*, 1802; *Sketches in Ireland*, by the Rev. C. Otway; *Northern Tourist*; Inglis's *Ireland in 1834*; *Memoirs of Ordnance Survey of Ireland*, Hodges and Smith, Dublin, 1837; *Parliamentary Papers*, &c.)

DONGOLA, a province of Upper Nubia, extending southwards from the borders of Mahass about 19° 30' N. lat., along the banks of the Nile as far as Korti, about 18° N. lat., where it borders on the country of the Sheygia Arabs. The Nile coming from Sennaar flows in a northern direction through Halfay, Shendy, and the Barabra country to about 19° N. lat. and 33° E. long., when it suddenly turns to the south or south-south-west, passing through the Sheygia country. [BARKAL.] After passing below the rock of Barkal, as it reaches the town or village of Korti, its course assumes a direction nearly due west, which it continues for about 20 or 30 miles, and then resumes its north direction towards Egypt. The province called Dongola stretches along the banks of the river from Korti first to the westward, and then northwards, following the bend of the stream to below the island of Argo, where it borders on Dar-Mahass, which last is a distinct province of Nubia. The whole length of Dongola is about 150 miles, and its breadth may be considered as extending no further than the strip of cultivable land on each bank, which varies from one to three miles in breadth, beyond which is the desert. The left or west bank is the more fertile, the eastern being in most places barren, and the sands of the desert stretching close to the water's edge. (Waddington and Hanbury's *Travels*.) The fine and fertile island of Argo is included within the limits of Dongola. The principal place in Dongola is Maragga or New Dongola, on the left or west bank,

in 19° 9' N. lat., which was in great measure built by the Mamelukes during their possession of the country from 1812 to 1820, when they were driven away by Ismail, son of the pasha of Egypt. (Caillaud's *Travels*.) Further south and on the right bank of the Nile, is Dongola Agous or Old Dongola, formerly a considerable town, but now reduced to about 300 inhabitants. At one end of it is a large square building, two stories high, which was formerly a convent of Coptic monks, and the chapel of which has been turned into a mosque. There are also other remains of Christian monuments, for Dongola was a Christian country till the fourteenth century, and Ibn Batuta speaks of it as such. Makrizi in the fifteenth century describes Dongola as a fertile and rich country with many towns; and Poncet, who in 1698 visited Old Dongola and its king and court, speaks of it as a considerable place. The king was hereditary, and paid tribute to the king of Sennaar. After Poncet's time, however, the Sheygia Arabs desolated Dongola, and reduced it to subjection during a great part of the last century, a circumstance which accounts for the present depopulated and poor state of the country. When the Mamelukes who had escaped from Egypt came to Dongola in 1812, the country was under several Meleks or petty native chiefs, subject however to the Sheygia Arabs. It is now a Beylik dependent on the pasha of Egypt; and the bey of Dongola, who resides at Maragga, extends his jurisdiction also over the country of the Sheygia Arabs. The natives of Dongola resemble those of Lower Nubia in appearance, they are black, but not negroes; they produce dourra, barley, beans, and have sheep, goats, and some large cattle. The fine horses which in Egypt are known by the name of Dongola come chiefly from the Sheygia or Barabra countries. The houses are built of unbaked bricks, made of clay and chopped straw. The country of Dongola is more fertile than Lower Nubia, but the people are few and indolent or dispirited by long calamities. Ruppel, in his 'Travels to Nubia and Kordofan,' gives particulars of the manners and habits of the people of Dongola.

DONNE, JOHN, was born at London in the year 1573 of respectable parents. At the early age of eleven, being esteemed a good Latin and French scholar, he was sent to the University of Oxford, and after remaining there a few years was removed to Cambridge. Although he greatly distinguished himself in his studies he took no degree, as his family being Catholic had conscientious objections to his making the requisite oath. At the age of seventeen he went to Lincoln's Inn to study the law; and while here, in order to satisfy certain religious doubts, he read the controversies between the Roman Catholics and Protestants, and decided in favour of the latter. After travelling for about a year in Spain and Italy, he became on his return secretary to Lord Elinore, and fell in love with that nobleman's niece, the daughter of Sir George More. The lady returned his affection, and they were privately married. When this union was discovered by Sir George he was so indignant, that he induced Lord Elinore to dismiss Donne from his service. The unfortunate secretary was afterwards imprisoned by his father-in-law, and his wife was taken from him; but by an expensive law-proceeding, which consumed nearly all his property, he was enabled to recover her. Sir George forgave him shortly afterwards, but absolutely refused to contribute anything towards his support, and he was forced to live with his kinsman, Sir Francis Whalley. Dr. Morton, afterwards bishop of Gloucester, advised Donne to enter into the Church, and offered him a benefice; but although in great poverty he refused the offer, thinking himself not holy enough for the priesthood. Sir Francis Whalley at last effected a complete reconciliation between Donne and Sir George, who allowed his son-in-law 800*l.* in quarterly sums of 20*l.* each, till the whole should be paid. Still he continued to be in embarrassed circumstances, and after reading some time at Mitcham, whither he had removed for the sake of his wife's health, he lived in the house of Sir Robert Drury, at Drury Lane. He accompanied that gentleman to Paris, contrary to the solicitations of his wife, who could not bear to be parted from him, and who, as she said, felt a foreboding of some evil. While Donne was in Paris, there is a story that he saw the apparition of his wife enter his apartment bearing a dead child, and shortly afterwards received the intelligence that his wife had actually been delivered of a dead child at that very moment. The honest angler, Isaac Walton, who writes Donne's Biography,

seems inclined to believe this story. On Donne's return to England he was introduced to James I., and delighted the king by a polemic treatise against Catholicism, entitled 'Pseudo-Martyr.' James was so anxious that he should take holy orders, that Donne at length complied, and became the king's chaplain-in-ordinary. His style of preaching is thus described by Walton: 'always preaching as an angel from a cloud, but not *in* a cloud.' The University of Cambridge made him doctor of divinity; and now, just as he was rising from his misfortunes, his happiness was embittered by the death of his beloved wife. The benchers of Lincoln's Inn presented him with their lectureship; and after accompanying an embassy to the queen of Bohemia, James's daughter, he became dean of St. Paul's and vicar of St. Dunstan's, being then in the fifty-fourth year of his age. Falling into a consumption, he was unable to perform his clerical duties; but some enemy having hinted that he merely feigned illness because he was too idle to preach, he mounted his pulpit, and almost in a dying state, preached what Walton has called his 'own funeral sermon.' This discourse was afterwards printed under the quaint title of 'Death's Duel.' From this time he abandoned all thoughts of life, and even had a portrait painted of himself, enveloped in a shroud, which he kept in his bed-room. Shortly afterwards he died, having exalted himself (according to Walton), almost to a state of angelic beatitude.

Of the real goodness and piety of Donne there can be no doubt. But while we admire these genuine qualities, we must not be blind to the superstitions and puerilities which were blended with Donne's religion, though these might be attributed partially (but not wholly) to the age. There was evidently a great deal of simplicity about him, as well as about his biographer Walton, who, enthusiastic in his admiration, exalts a weakness as much as his hero's most brilliant qualities. However, to those who wish to see characters like Donne treated in the spirit of their own time, we cannot recommend a more delightful book than Walton's *Life of Donne*.

As a poet, Donne was one of those writers whom Johnson has (to use Wordsworth's expression) 'strangely' designated metaphysical poets: a more infelicitous expression could not well have been devised.

In the biography of Cowley, Johnson has committed an unintentional injustice towards Donne. By representing Cowley's faults as the faults of a school, he brings forward parallel passages from other authors containing like faults, and Donne is one of them. He has previously described the school as a set of cold unfeeling pedants, and hence the reader finding Donne's worst lines cited in illustration of that remark, may easily imagine that he never did anything better, and set him down as a mere pedantic rhymist.

The fact is, that 'quaint conceits' are only the deformities of Donne's poetical spirit: the man himself had a rich vein of poetry, which was rarely concealed even when most laboriously encumbered, while some of his pieces, both for thought and even melody, are absolute gems. His fault, far from being coldness, is too much erotic fervour: he allows his imagination to run loose into the most prurient expressions; and in some of his amatory pieces, the conceits stand as a corrective to their excessive warmth. His satires, though written in a measure inconceivably harsh, are models of strength and energy. Their merits were discovered by Pope, who (to use his own odd phrase) translated them into English.

Donne's principal theological works, besides sermons, are the 'Pseudo-Martyr,' and a treatise against suicide, called 'Bia-thanatos.'

We beg leave to call the attention of those readers who study the progress of their own language to one fact, and that is, that whilst many of the pieces of Donne, written in lyric measures, are absolute music, what he has composed in the heroic measure is painfully uncouth and barbarous. Thus, though the invention of heroic verse took place at an early period (it is attributed to Chaucer), we find that a language must be in a highly cultivated state before this kind of verse can be written in perfection.

DOOM or DOUM, a remarkable palm-tree exclusively inhabiting Upper Egypt, especially the neighbourhood of Thebes, whence it is named *Cucifera Thebaica*. Its stem, instead of growing without branches like other palms, forks two or three times, thus assuming the appearance of a *Pandanus*. Clumps of it occur near Thebes; the fruit is about the size of an orange, angular, irregularly formed, of

a reddish colour, and has a spongy, tasteless, but nutritious rind. The albumen of the seed is hard and semitransparent, and is turned into beads and other little ornaments. Gæstner described it under the name of *Hyphæne coriacea*.

DOOMS, FALSING OF, a term of the old Scots law somewhat similar in import with appeal of false doom in the law of England. A doom or judgment thus falsed or charged with injustice, was of old taken from the bailies or burghs to the court of Four-boroughs, and from the court baron or freeholder's court to the court of the sheriff, thence to the justice ayre, and thence to the parliament. But on the institution of the court of session, in 1532, a new method of review was established, the proceedings of the inferior courts being thenceforward carried into the court of session by advocacy, suspension, and reduction, a form of process derived from the tribunals of modern Rome, and from the court of session to parliament by protest for remeid of law, and now to the House of Lords by appeal.

The civil jurisdiction of the court of justiciary declined immediately on the institution of the court of session. By the Jurisdiction Act, however, 20 Geo. II., a power of appeal to a limited extent was again bestowed on the circuit court of justiciary, and a process of appeal laid down entirely in the spirit of the antient falsing of dooms. This method of appeal has, with some slight alterations, been continued to the present time.

For the old falsing of dooms, see *Stat. Will.* c. 10; 1429, c. 116; 1471, c. 41; 1503, c. 95, 99.

DOONGURPORE, a small principality, situated in the district of Bagur and province of Gujerat, in a hilly tract, as to which but few particulars are known. This principality was formerly united to Odeypore, in Rajpootana, and the rajah of Doongurpore still claims seniority over the reigning sovereign of Odeypore, but this distinction is merely nominal, and there is in fact no political connexion between the two rajahs. The greater part of the inhabitants of Doongurpore are Bheels, who are considered to be the Aborigines of the country. Some years ago the rajah to preserve his authority, which was threatened by the more powerful among his subjects, took some bands of Sindes into his pay, but they soon usurped all power, and were proving destructive to the country, when the rajah sought and obtained the protection of the English under whose intervention the country has recovered from the desolate condition to which it had been reduced. The town of Doongurpore, the capital, is situated in 23° 54' N. lat. and 73° 50' E. long.: about 95 miles north-east from Ahmedabad. A lake near this town is said to have its mounds constructed with solid blocks of marble.

DOOR and DOORWAY, the entrance leading into a public or private edifice, and the opening or entrance way into an apartment or from one apartment to another. This way is closed with the door, which is generally made of wood, and hung to one of the sides or jambs of the doorway. The name door is from the Saxon part of our language, but it is one of those roots which occur also in the cognate languages, as the Greek and Latin. The doorway consists of a sill, or horizontal piece laid on the ground, the perpendicular pieces, architraves or jambs, called also by Vitruvius the antepagments, and the lintel, or piece laid on the top of the jambs. According to Vitruvius (iv. 4), who gives general rules for the proportions of the portals of temples, the hypothyron, or aperture for doors, should be as follows:—The height from the pavement to the ceiling of the temple being divided into three parts and a half, two of the whole parts were allowed for the height of the door. These two parts were subdivided into twelve smaller parts, of which five and a half were allowed as the width of the door at the base; and the upper part was contracted according to the following rules: if not more than 16 feet high, the contraction was one-third of the width of the jamb on the face; if the height was more than 16, and not exceeding 25 feet, a fourth part of the width of the jamb only was employed; and from beyond 25 feet, and not exceeding 30 feet one-eighth only. Doors higher in proportion were made perpendicular.

The Egyptian doorway is perpendicular, and consists of two flat architraves of stone, with a flat lintel surmounted by an astragal moulding, above which is a frieze terminated with a bold cavetto and fillet. The doorway inclosed between the architraves and lintel is narrow in its proportions. The form of the door itself (if there ever was one used) is unknown.

Egyptian Door from Denderah.

The Greek doorway is often inclined inwards, or contracted at the top; it has also a peculiar lintel or top-stone, with mouldings running round it and meeting the ends of the architrave, and forming two elbows, thus:

Greek lintel head, showing the manner in which the architrave moulding is formed round it.

The mouldings of the architraves are delicately formed, and decorated with ornaments, and a frieze and cornice supported on consoles are sometimes added. The decorations of the Erechtheum doorway are very rich, but the size of our cut precludes the possibility of giving them. We have no example of the form and construction of a Greek door.

Greek Doorway of the Erechtheum; from Donaldson's work on Doors.

The Roman doorway is formed on the model of the Greek, except that the elbows or projections of the architrave

mouldings over the lintels are of rare occurrence, as well as the inclination of the jambs or their contraction at the tops: they occur however in the temple of Vesta at Tivoli, and of Hercules at Cora. The bronze door of the Pantheon at Rome, of which we have given a cut, is not we believe altogether an antique model. The bronze door of the temple of Romulus at Rome is however an antique door. (Donaldson on Doors, plates.) Some notion of the

Pantheon Door and Doorway; from Donaldson's work on Doors.

construction and panelling of ancient doors may be derived from the above work. Many beautiful models of modern doorways exist at Rome, and in various cities of Italy. A careful study of them cannot fail to improve the taste of the architect. The modern bronze doors of the Baptistery at Florence and St. Peter's at Rome are unrivalled for their size, design, and beauty of workmanship.

Wooden-framed doors, either single or double, consist of styles or upright side pieces, rails or horizontal pieces tenoned into the styles, and panels or thinner pieces of

Common framed Door. 1, 1, 1, 1, panels; 2, 2, styles; 3, 3, architrave, or jamb; 4, lintel; 5, 5, rails; 6, 6, 6, muntins; 7, sill.

wood let into grooves in the compartments formed by the joining the rails and styles together. Munnions, a corruption of mullions, are short upright pieces let into the rails. The panels have often a moulding running round their edges, either on one or both sides. For the technical terms of framed doors, the reader may consult Nicholson's Dictionary; and for the best general information on doors, the recent work of T. L. Donaldson on Doors.

DOOR, GOTHIC. [GOTHIC ARCHITECTURE.]

DOORNIK. [TOURNAI.]

DORA'DO (constellation), the sword-fish, a constellation of Bayer, situated in the southern hemisphere, and out nearly in half by a line joining α Argus and ϵ Eridani. The principal stars are as follows.

| Character. | No. in Catalogue of | | Magnitude. |
|------------|---------------------|------------------|------------|
| | La Caille. | Astron. Society. | |
| γ | 327 | 483 | 4 |

| β | 436 | 697 | 4 |
| δ | 455 | 730 | 5 |
| ϵ | 468 | 741 | 5 |

DORAT, CLAUDE JOSEPH, was born at Paris in the year 1734. Having a considerable fortune he devoted himself entirely to poetry, and produced a number of tragedies, which, though some were successful, drew on him torrents of ridicule from contemporary wits. He seems however to have attained some reputation as a writer of the lighter class of poems. He had a great passion for bringing out splendid editions of his own works, and the cost of vignettes and tail pieces consumed his fortune. He died in the year 1780.

The works of Dorat fill twenty volumes, but they are not highly estimated. La Harpe will scarcely allow him mediocrity. *La Déclamation Théâtrale*, a work on the proper department of actors, is considered his chef d'œuvre; but, though it is replete with wholesome advice to performers, it is deficient in everything that can be called poetry. His lighter tales in verse are told with naïveté and humour; of these *Aphonse* enjoys the best reputation, but they are terribly indecent. His dramas are entirely forgotten.

It should be observed that the edition of the works of Dorat in twenty volumes is adorned with engravings superior to most works of the time; and though we may blame the author for his prodigality in lavishing his fortune on such ornaments, we must not refuse the praise which is due to his taste, considering that these choice engravings were made at his own suggestion.

DORCHESTER, a borough and market-town, having separate jurisdiction, in the division of Dorchester and county of Dorset, 120 miles south-west by west from London.

Dorchester was called by the Romans 'Durnovaria,' and 'Durinum.' Hutchins, in his history of Dorsetshire, says that the first part of the name Dorchester is from Dur, or Dwr, in ancient British, *water*, which seems the best opinion. By the Saxons it was called 'Dornceaster,' from whence we have the modern name Dorchester. It has also been called 'Villa Regalis,' to distinguish it from Dorchester in Oxfordshire, called 'Villa Episcopalis.'

Placed on the 'Via Icenia' (the Icknield street), it must have been a place of some importance in the time of the Saxons, as two mints were established here by King Athelstan. The town was nearly destroyed by fire in 1613: 300 houses, and the churches of the Holy Trinity and All Saints, were totally consumed; and the loss is estimated by Hutchins at the enormous sum of 200,000*l*.

Many severe battles were fought in the vicinity of Dorchester between the king's and the parliamentary forces during the civil war. At the assizes held here on the 3rd of September, 1685, by Judge Jefferies and four other judges, out of 36 persons tried on a charge of being implicated in Monmouth's rebellion, 29 were found guilty and sentenced to death. The following day 292 persons pleaded guilty, and 80 were ordered for execution. John Tutchin,

who wrote the 'Observer' in Queen Anne's time, was sentenced to be whipped in every town in the county once a year, but on his petitioning to be hanged as a *mitigation* of his punishment, he was reprieved, and subsequently pardoned.

The manor of Dorchester has passed through the hands of a great many families, and in the 11th year of the reign of King Henry IV. appears to have been the king's demesne borough. In the 1st of Henry V. the profits of the borough were confirmed to the burgesses at a fee-farm rent of 90*l*. The rent was subsequently granted, and is now paid, to the Hardwicke family.

The corporation claim a prescriptive right, but they have charters of Edward III., Charles I., and of other reigns: the governing charter is that of the 5th Charles I. The assizes and courts of quarter-sessions for the county and for the borough are held here; as well as a court of record and a court leet. A high steward is appointed for life.

The borough has returned two members to parliament since the 23rd year of the reign of King Edward I., but, by the Boundary Act, the boundaries are considerably extended, and include Fordington, Colleton Row, and part of Trinity parish, and include a population of 4940 inhabitants. The population of the town itself is 8033, of whom 1552 are females.

The town of Dorchester is pleasantly situated on a slight elevation near the river Frome, and consists principally of three spacious streets, which are well paved and lighted. A delightful walk, well shaded, surrounds two-thirds of the town. Races are annually held here in September; and a theatre was erected in 1826. The shire hall is a plain building of Portland stone, and is commodiously fitted up. The gaol, built in 1796, contains the county gaol, the house of correction, and the penitentiary: the interior is divided into four wings, communicating by cast-iron bridges.

The trade is now very trifling, but in the reigns of King Charles I. and James I. the manufacturing of cloth was carried on to some extent: the market-days are Saturday and Wednesday. There are fairs on Trinity Monday, St. John the Baptist's, and on St. James's days; the three last are principally for sheep and lambs, for which Dorchester is celebrated. A tract of land, called Fordington Field, partly meadow, partly arable, surrounds a portion of the town: its soil is particularly adapted for the feeding of cattle, and it extends over a surface seven miles in circumference, without any inclosures.

The town is divided into three parishes, All Saints (commonly called All Hallows), St. Peter's, and the Holy Trinity, and is in the archdeaconry of Dorset and diocese of Bristol. St. Peter's church contains some curious monuments, is spacious, well built, and consists of a chancel, nave, aisles, and an embattled tower, 90 feet in height. The living of Trinity is by far the best, being now worth 439*l*. a year. There are also places of worship for Baptists, Independents, Wesleyan Methodists, and Unitarians.

A free grammar-school was founded and endowed by Mr. Thomas Hardy in the year 1579, the government of which is vested in trustees. It has two exhibitions, of 10*l*. per annum, to St. John's College, Cambridge, and one of 5*l*. per annum to any college of either University. A second school, founded prior to the grammar-school, was refounded in 1623 by the corporation, the master of which instructs five boys gratuitously in reading, writing, and arithmetic. There are almshouses, founded by Sir Robert Napier in 1615, by Matthew Chubb in 1619; and the Whetstone almshouses, for the support of four couples, or four single persons.

The town was strongly fortified and entirely surrounded by a wall, when in possession of the Romans; and the site where an ancient castle stood is still called Castle Green. The building itself was totally demolished, and a priory for Franciscan monks was constructed out of the materials by one of the Chidiok family, in the reign of Edward III., near the site of the old castle. The church of the priory was pulled down at the Reformation, and the house became the residence of Sir Francis Ashley, and was subsequently converted into a Presbyterian meeting-house.

Tesselated pavements, Roman urns, and a quantity of coins of Antoninus Pius, Vespasian, Constantine, and other Roman emperors, have been dug up in the vicinity of Dorchester.

DORDOGNE, a river in the south of France, rises in the department of Puy de Dôme, on the slope of Mont

Dor, the summit of which (Puy de Sancy, 6224 feet high) is the highest point of central France. The Dordogne flows past the towns of Bort, Argentat, and Beaulieu, all in the department of Corrèze, to the junction of the Cère.

From the junction of the Cère the course of the Dordogne is westward: at Mayronne, 14 miles below the junction, the navigation commences; and at Limeuil, about 40 miles below Mayronne, the Dordogne receives the Vézère, a navigable tributary, which rises in the department of Corrèze, and has a south-western course of about 100 miles. [CORRÈZE.] At Libourne, 70 miles below the junction of the Vézère, the Dordogne receives the Isle, its largest tributary, which rises in the department of Vienne, and has a south-west course of nearly 120 miles. About 22 miles below the junction of the Isle, the Dordogne unites with the Garonne, and forms the estuary of the Gironde. Its whole length is about 240 to 250 miles, for more than 130 of which it is navigable. The tide flows up to Castillon, nearly 50 miles above its junction with the Garonne: and sometimes at spring tides, when the water in the river is low, sets in with a violence which overwhelms everything. The anchors of the boats and vessels moored in the stream are carried away, the cables broken, and the vessels wrecked, unless the owners have taken the precaution to place them in the middle of the channel, where the depth of the water diminishes the violence of the stream. This violent flow of the tide is called *Le Mascaret*; the noise which it makes may be heard as far off as seven or eight miles. [BORZ.]

The Dordogne is noticed in the writings of Ausonius and Sidonius Apollinaris, in the 4th and 5th centuries under the name of Duranius. Gregory of Tours, in the 6th century, calls it Dorononia; and Eginhard (9th century) Dordonia. Dordonia, the Latinized form of Dordogne, first appears in the writings of Aymoin or Aimoin in the end of the 10th or beginning of the 11th century.

DORDOGNE, a department in the south of France, taking its name from the river just described. Its figure approximates to that of an equilateral triangle, having its sides respectively facing the S., N.E. and N.W. It is bounded on the N. and N.E. by the department of Haute Vienne; on the E. by that of Corrèze; on the S.E. by that of Lot; on the S. by that of Lot and Garonne; on the S.W. by that of Gironde; on the W. (for a very short distance) by that of Charente Inférieure; and on the N.W. by that of Charente. Its greatest length from N. to S. is about 80 miles, and its greatest breadth from E. to W. about 72 miles. The area of the department, according to M. Malte Brun, is 3640 square miles; rather more than the joint area of the English counties of Norfolk and Suffolk; the population in 1832 was 482,750 (not more than 12-17ths of the population of the two English counties just mentioned), giving 133 inhabitants to a square mile. Périgueux, the capital, on the Isle, (population in 1832, 8700 for the town, or 8956 for the whole commune,) is about 264 miles in a straight line S.S.W. of Paris, or 294 miles by the road through Orléans, Vierzon, Châteauroux, and Limoges.

There are no very lofty hills in this department. The hills which run N.W. from the mountains of Auvergne send off a subordinate chain which just crosses the northern part of the department near Nontron. Other hills of lower elevation traverse the department, and form, except in the instance of the two great rivers, the Dordogne and the Isle, narrow valleys, which are liable to be inundated and damaged by the floods. The department is watered by the Dordogne, which passes through it from E. to W.; and is navigable throughout this part of its course. The Vézère enters this department from that of Corrèze, and flows past Montignac, where it becomes navigable into the Dordogne. The Isle arises in the department of Haute Vienne, and entering that of Dordogne on the N.E., flows through it in a S.W. direction, until it enters the department of Gironde a few miles above its junction with the Dordogne. The Dronne rises in the department of Haute Vienne, and entering that of Dordogne, flows through it or along the border until it enters the department of Gironde, and unites with the Isle. These are the principal rivers. Of the smaller ones, the Nizonne, which receives the Belle and the Pude, falls into the Dronne; as do also the Boulou and the Colle: the Loue, the Haute Vézère (which rises in the department of Corrèze), the Vern, the Salambre, and the Grande Durche, fall into the Isle: the Beune falls into the Vézère; and the Melve, the Ceou, the Couze, the Coudou united with the Loure, into the Dordogne; the

Bandiat, in the northern part of the department, belongs to the basin of the Charente, and the Dropt and the Allemance, in the southern part, to that of the Garonne.

'The soil is far from productive: the calcareous rock often presents its bare surface, or is covered only with heath, broom, and chestnut-trees, which occupy immense tracts. Sometimes the continuity of these arid lands is broken only by the intervention of marshes. Rich and fertile spots occur, as it were, accidentally in the midst of this district. The grain harvests would be insufficient for the support of the inhabitants, were they not eked out by the use of chestnuts as food: but of the produce of the vineyards more than half is sold as wine or converted into brandy for exportation. The mineral wealth of the department is considerable: it consists of pit coal, manganese, and several other articles, especially iron. But that which entitles this department to the consideration of epicures is the white wine of Bergerac, the delicacy of the pork, the abundance of red partridges, the excellent pike which are found in the ponds, the liqueurs, the fine confectionary of Périgueux, and, above all, the truffles which the district round that town affords.' (Malte Brun.)

The department contains 635 communes, and is divided into five arrondissements or sub-prefectures, viz., Périgueux, central (101,527 inhabitants); Nontron, in the north (82,122 inhabitants); Bergerac, in the south (116,897 inhabitants); Sarlat, in the east (109,430 inhabitants); and Ribérac, in the west (72,774 inhabitants). Of the towns, Périgueux and Bergerac on the Dordogne (population, 5966 for the town, 8557 for the whole commune,) are described in their respective articles.

Sarlat is between the Dordogne and the Vézère, on a brook which flows into the former and in a deep valley. The neighbourhood abounds with copper and iron mines, coal-pits, and mill-stone quarries. The population of Sarlat in 1832 was 3917 for the town, or 6056 for the whole commune. The inhabitants are engaged in making paper. Though it is so small a place, Sarlat was before the Revolution a bishop's see. The bishop was a suffragan of the archbishop of Bordeaux. Sarlat was one of the strongholds of the Huguenots, and was twice besieged in the religious wars of the sixteenth century.

Ribérac is on the left or south bank of the Dronne in a fertile plain, in which corn and hemp are grown, and sent to Bordeaux. There are at Ribérac the remains of a strong castle, once belonging to the viscounts of Turenne. The population of the whole commune in 1832 was 3954; that of the town is not distinguished. Ribérac is not on or near any main road.

Nontron is on the Bandiat, in the northern part of the department. The inhabitants amounted in 1832 to 2132 for the town, or 3246 for the whole commune. They manufacture leather and common cutlery, and carry on trade in the iron produced by the mines and wrought in the forges of the surrounding country.

Beside the above, which are the capitals of arrondissements, there are in the north, St. Jean-de-Colle, on the river Colle; Mareuil and Thiviers, on the Belle; and La Roche-Beaucour, on the Nizonne. The last is on the road from Paris to Périgueux, 20 or 21 miles from the latter, and consists of one crooked, steep and ill-paved street, with ill-built houses. The situation however is pleasant. The inhabitants are given by Vaysses de Villiers (A.D. 1818) at 1500. Many sheep, whose flesh is in good esteem, are fed in the neighbourhood. In the eastern part there are Excideuil, near the Loue, Terrasson and Montignac on the Vézère, and St. Cyprien on the Dordogne. Montignac had in 1832 a population of 2629 for the town, and 3923 for the whole commune: the navigation of the Vézère begins here. Terrasson is on the road from Périgueux to Brives and Tulle. St. Cyprien had in 1832 a population of 1541 for the town, or 2375 for the whole commune.

In the western part are St. Aulaye and La Roche-Chalais or Chalais, on the Dronne, and La Tour Blanche, near the source of the Pude; and Villefranche-de-Louchapt, between the Isle and the Dordogne: these are all very small places. In the south are Eymet, on the Dropt; Beaumont, on the Couze; Isigréac, Belvès, Biron, Monpazier, and another Villefranche. Belvès had, in 1832, a population of 1781 for the town, or 2363 for the whole commune. A considerable quantity of nut-oil is made here. Biron was a barony held by the Maréchal de Biron, one of the chief supporters of Henry IV., and was made a duchy in favour

of the son of the *Maréchal*, who was afterwards beheaded for a conspiracy against Henri.

In the centre of the department are Brantôme and Bourdeilles, on the Dronne; St. Astier, on the Isle; and La Linde, on the Dordogne. Brantôme has a population of nearly 3000. According to the 'Dictionnaire Universelle de la France' (A.D. 1804), the manufactures of Brantôme were serges, hosiery, and cotton and woollen yarn. There was at this place a Benedictine abbey, founded by Charlemagne, A.D. 769. This abbey was held in commendam by Pierre de Bourdeilles, author of the well-known 'Mémoires de Brantôme.' The town of Bourdeilles is said by Expilly to have an antient castle. The inhabitants of the town were, according to the 'Dictionnaire Universelle,' engaged in weaving serges and other light woollens, and cotton hose.

Not far from the bourg or small town of Miremont, near the Vézère, is a cavern whose ramifications extend for about five miles. Another cavern, that of Mussidan, in the west of the department, is remarkable for the fountain of Sourzac, which gushes from it and forms a cascade.

For ecclesiastical purposes, the department forms the diocese of Périgueux, the bishop of which is a suffragan of the archbishop of Bordeaux: for the administration of justice, it is included in the jurisdiction of the *Cour Royale* of Bordeaux; and for military affairs it is comprehended in the eleventh division, of which the head-quarters are at Lordeaux. It sends seven members to the Chamber of Deputies. (Malte Brun; Balbi; Vayasse de Villiers.)

In respect of education, this department is rather behind the average of France. M. Dupin assigns to it, in the chart subjoined to his 'Forces Productives, &c. de la France' (Paris, A.D. 1827), one male child at school to every 104 inhabitants.

DORDRECHT. [Dort.]

DO'RIA, ANDRÉ'A, was born in 1466 at Oneglia, in the western Riviera of Genoa, of an antient noble family, to which Oneglia belonged as an imperial fief. Having lost his parents at an early age, Doria embraced the profession of arms, served under several princes in various parts of Italy, and lastly entered the service of Francis I., who made him commander of his fleet in the Mediterranean. Genoa had been for a long time distracted by factions, which had brought it under the dominion or protection, as it was styled, of the Visconti and Sforza, dukes of Milan. The French having conquered the duchy of Milan, placed a garrison in Genoa, upon condition of respecting the liberties of the citizens, a promise which they kept with the usual faith of conquerors. The citizens were oppressed in various ways, and Doria having remonstrated with the agents of Francis in behalf of his countrymen, a secret order came for his arrest, just after his nephew and lieutenant, Filippino Doria, had gained an important victory for the French over the imperial fleet near the coast of Naples in 1528. The French were then besieging Naples by land. Barbezieux, a French naval officer, was sent to Genoa with twelve galleys to seize on the person of Andrea Doria, who, having had intimation of this design, retired into the gulf of La Spezia, sent for his nephew to join him with the galleys which he had fitted out at his own expense, and offered his services to Charles V., who received him with open arms. Doria stipulated with Charles that Genoa, as soon as it was freed from the French, should be restored to its independence under the imperial protection, but no foreign garrison or government should be admitted into it. At the same time he engaged to serve the emperor with twelve galleys, fitted out by himself, which number was afterwards raised to fifteen, for which Charles agreed to pay him 90,000 ducats a year. Doria soon after appeared before Genoa with his little squadron, and being favoured by the inhabitants, he obtained possession of the city, and drove the French away. It is said that Charles offered him the sovereignty of Genoa; but Doria preferred a nobler course. He re-organised the government of the republic, and, in order to extinguish the factions, he named a certain number of families of nobles and citizens, out of which the legislative council was to be chosen annually. New families might be added to the number from time to time. A Signoria, or Council of Sixteen, with a Doge, renewed every two years, composed the executive, and five censors were appointed for five years as guardians of the laws. Doria was appointed censor for life, with the title of 'Father and Liberator of his country.' He now resumed his naval career as admiral of Charles V., and distinguished himself against the Turks P. C. No. 542.

and the Barbary pirates. He escorted Charles V. to the expedition of Tunis in 1535, and contributed greatly to the taking of the place. In 1538 he joined the Venetian fleet off Corfu, when he lost the opportunity of attacking, with every chance of success, the Turkish armament commanded by the famous Barbarossa. [BARBAROSSA; KHAIR EDDIN] His conduct on the occasion was attributed to secret instructions from the emperor. In 1541 Doria commanded the fleet in the expedition of Charles V. against Algiers, from which he is said to have tried in vain to dissuade the emperor. It turned out as he had foreseen, and he could only save the emperor with a small part of the army. In his old age, Doria retired to Genoa, where he lived in great splendour and reputation, the first among his fellow-citizens, respected by all, and consulted upon all matters of importance. Charles V. created him Prince of Melfi and Tarsi in the kingdom of Naples. At the beginning of 1547 his life was threatened by the 'conspiracy of Fieschi: his nephew Giannettino was murdered, but Andrea escaped, and Fieschi perished in the attempt. A few months after a fresh conspiracy was formed against him by Giulio Cibo, a Genoese emigrant, who however was discovered and executed. In 1548 some of the ministers of the emperor proposed to build a fortress, and introduce a Spanish garrison, in Genoa, under the pretence of preventing any new conspiracies, but the Genoese appealed to Doria, who interposed and prevented the execution of the project. In 1552 Doria, then eighty-five years old, went to sea again, to attack his old enemies the Turks, who, under Dragut Reis, were ravaging the coast of Naples. Doria lost some of his galleys, which were surprised by the Turks, but Dragut sailed away for the Levant. In 1556 he resigned his command to his nephew, Gian Andrea Doria, who was confirmed as admiral by Philip II. Andrea Doria died in his palace at Genoa in November, 1560, being then ninety-four years of age. He left no issue, and no very large fortune, owing to his splendid way of living and generous disposition. The Genoese paid great honours to his memory, and lamented his death as a public calamity. Doria was one of the greatest characters that Italy produced during the middle ages, and one of the few that were fortunate to the last. Several individuals of his family have distinguished themselves at various times in the service of the republic of Genoa. A branch of the Doria family are settled at Rome, with the title of princes. (Casoni, *Annali di Genova*; Botta, *Storia d'Italia*.)

DORIANS, the most powerful of the Hellenic tribes, derive their origin from a mythical personage named Dorus, who is generally made the son of Hellen, though he is described as the son of Xuthus by Euripides (Ion., 1590). Herodotus mentions (I. 52) five successive migrations of this race. Their first settlement was in Phthiotis, in the time of Deucalion; the next, under Dorus, in Hestiasotis, at the foot of Ossa and Olympus; the third on Mount Pindus, after they had been expelled by the Cadmeans from Hestiasotis. In this settlement, says Herodotus, they were called the Macedonian people; and he elsewhere (viii. 43) attributes to the Dorians a Macedonian origin; but there does not appear to have been any real connexion between the Dorians and the Macedonians (who, it has been shown, were of Illyrian extraction: Müller, *Dor.*, i., p. 2) beyond this vicinity of abode. The fourth settlement of the Dorians, according to Herodotus, was in Dryopis (afterwards called the Dorian Tetrapolis); and their last migration was to the Peloponnese. Another, and most remarkable expedition, not mentioned by Herodotus, was the voyage of a Dorian colony to Crete, which is stated to have taken place while they were in their second settlement at the foot of Olympus (*Androm. apud Strabon.*, p. 475 D); and Dorians are mentioned among the inhabitants of that island even by Homer (*Od.* xix., 174). The eastern coast was the first part which they occupied. (*Staphylus apud Strabon.*, p. 475 C.) This early settlement in Crete must not be confused with the two subsequent expeditions of the Dorians to that island, which took place after they were well settled in the Peloponnese, the one from Laconia under the guidance of Pollis and Delphus, the other from Argolis under Althæmenes. The migration of the Dorians to the Peloponnese, which is generally called 'the return of the descendants of Hercules,' is expressly stated to have occurred 80 years after the Trojan war, i. e. in 1104 A.C. (Thucyd. i., 12.) The origin and nature of the connexion which subsisted between the Heracleidæ and the Dorians are involved in much obscurity. The Dorians were from

very early times divided into three tribes, and the epithet *thrice-divided* (τρίχιδες) is applied to them by Homer in the passage referred to above. These three tribes were called the Hyllæans, the Dymaneæ, and the Pamphylians. Now the two latter tribes are said to have descended from Dymas and Pamphylius, the two sons of Ægimius, a mythical Doric king, and the first claimed a descent from Hyllus, the son of Hercules.

An attempt has been made to show that the Hyllæans were of Doric origin as well as the other two tribes (Müller *Dor.* i. chap. 3, sec. 2), but we are inclined to infer from the traditions as well as from the duplicate divinities of the Dorians, that the genuine Dorians were included in the two other tribes, and that the Heraclidean were a powerful Achaean family united with them in a similar manner, but by a stronger tie than the Ætolians under Oxyllus, who are also said to have taken part in this expedition. The Heraclidean, then, with their Ætolian and Dorian allies, crossed the Corinthian gulf from Naupactus, invaded and subdued Elis, which was assigned to the Ætolian chieftain, and bending their steps southward, conquered successively and with greater or less difficulty, Messenia, Laconia, Argolis, Corinth, and Mégaris. In Laconia they were joined by the Cadmean clan of the Ægidæ, who assisted them in their tedious war with Amyclæ, and afterwards took a part in the colonies to Thera and Cyrene. [Bæotia and Cræna.] This invasion, which so materially affected the destinies of Greece, was very similar in its character to the return of the Israelites to Palestine. The invaders, who, like the descendants of Abraham, brought their wives and children with them, though they perhaps did not completely abandon their last settlement, which was still called and considered Doric (Thucyd. i. 107), numbered about 20,000 fighting men on the highest estimate. (Müller, *Dor.* i. chap. 4, sec. 8.) They were, therefore, very inferior in number to the inhabitants of the countries which they conquered; but the superiority of their peculiar tactics ensured them an easy victory in the field, and they appear to have taken all the strong places either by a long blockade or by some lucky surprise; for they were altogether unskilled in the art of taking walled towns.

The governments which the Dorians established in all the countries which they thus invaded and conquered was, as might have been expected, very analogous to that which the Norman invasion introduced into England, namely, an aristocracy of conquest; for while the successful invaders remained on a footing of equality among themselves, all the old inhabitants of the country were reduced to an inferior condition, like the Saxons in England. They were called *νεῖσσοι*, or 'dwellers round about the city,' a name corresponding exactly to the *Pfahlbürger*, or 'citizens of the Palisade,' at Augsburg, who dwelt in the city suburbs without the wall of the city; to the 'pale' in Ireland before the time of James I.; to the people of the *condado* in Italy; and to the *fauxbourgeois* in France. (Niebuhr, *Hist. of Rome*, i. p. 398, Eng. tr.; Arnold's *Thucydides*, i. p. 626; and Borghini, *Origine della Città di Firenze*, p. 280, ed. 1584.) All the members of the one class were *gentle*, all those of the other class were *simple*. The constitution of Sparta in particular was an aristocracy of conquest as far as the relations between the Spartans and Lacedæmonians were concerned, while the Spartans themselves lived under a democracy with two head magistrates, who were indeed called kings, but possessed very little kingly power. The usual name for a constitution in a Doric state was an order or regulative principle (*κόσμος*), and this name appears to have arisen from the circumstance that the attention of the Doric legislators was principally, if not solely, directed to the establishment of a system of military discipline and to the encouragement of that strict subordination which is the result of it. To bring this about the Dorian population was continually engaged in public choral dances, in which the evolutions of an army were represented, and which served as a rehearsal for actual war. These dances were professedly in honour of the Doric god, Apollo, who was represented as the inventor of the lyra, their original accompaniment, and also as a god of war, and of civil government, as presiding over the Delphian Oracle, which regulated all the Doric law systems; but this is merely an expression of the fact that music was an important instrument in the civil and military organization of a Doric state. Apollo had a duplicate in his sister Artemis, and this, as we have before hinted, points to an ancient division of the Doric race

into two distinct tribes. (See Niebuhr, *Hist. of Rome*, i. p. 217, comp. p. 224.) The necessity for such a religion, and such a system of worship depending upon it, is to be explained by the peculiar relation subsisting between the Dorians and their *νεῖσσοι*. It was by superior prowess and discipline that they had acquired their rank, and it was only by a continuance of this superiority that they could hope to maintain themselves in the same position. Accordingly, it was important that while the bulk of the population was occupied as much as possible in agricultural employments, the Dorian aristocracy should enjoy sufficient leisure and have every inducement of religion and amusement to practise those martial exercises in which it was so needful for them to excel. The same occasion for strict discipline may also account for the extraordinary austerity which prevailed in most Doric communities. The Dorian women enjoyed a degree of consideration unusual among the Greeks. The *Syssitia*, or common tables, which were established in most Doric states, were designed to admonish those of the privileged class that, living as they did in the midst of a conquered but numerous population, they must not consider themselves to have any individual existence, but must live only for the sake of their order (*κόσμος*).

In addition to the Doric settlements which have been already mentioned, this race sent out many colonies: of these the most important were established along the south-west coast of Asia Minor. Rhodes, Cyprus, Corcyra, and Sicily also boasted a Doric population; Byzantium and Chalcædon were Megarean colonies; and the celebrated cities, Tarentum and Crotona, in Italy, were founded under the authority of Sparta.

The reader will find a full discussion of all questions relating to the history and peculiarities of the Doric race in Müller's *Dorier*, Breslau, 1824 (translated into English, with additions and improvements by the author, Oxford, 1830; in the second chapter of K. F. Hermann's *Lehrbuch der Griechischen Staatsalterthümer*, Heidelberg, 1836, translated, Oxford, 1836; and in Lachmann's *Spartanische Staatsverfassung*, Breslau, 1836.) Dr. Lachmann adopts the view which we have given of the original two-fold division of the Dorians, but considers the two first tribes to have been the Hyllæans and Dymaneæ, the Pamphylians being made up of volunteers who joined the expedition to the Peloponnese.

DORIC DIALECT, a variety of the Greek language peculiar to the Doric race. It was spoken in the Doric Tetrapolis; in the greater part of the Peloponnese; in the numerous Doric colonies in Italy, Sicily, and Asia Minor; in Crete, Ægina, Rhodes, Melos, Corcyra, and Cyrene. As a written language it is divided by grammarians into two classes, the old and new Doric. In the former Epicharmus, Sophron, and Alcman wrote; in the latter Theocritus, Bion and Moschus. The lyric poets in general wrote in the Doric dialect; but Pindar, perhaps the greatest of them, at all events the best known to us, wrote a language based upon the epic or Ionic dialect, but with a liberal use of Doric and Æolic forms. (Hermann de *Dialecto Pindari*, Opuscula i. p. 247.) The choruses in the Attic plays are written in a kind of Doric; which circumstance (as well as the use of Doric words by Pindar, a Theban) is to be accounted for by the Dorian origin of lyric poetry; for as Herodotus, although a Dorian, wrote his history, which is a kind of epic, in the Ionic dialect, because that was the prescriptive language for epic poetry, so all writers of odes adopted the Doric more or less, because the oldest lyric poems were written in that dialect. The existing monuments of the pure Doric, in addition to the fragments of the old writers which have been carefully collected, are the specimens in the comedies of Aristophanes, the treaties and decrees quoted by the Athenian historians and orators, and the inscriptions collected by Chandler, Mustoxidi, and Böckh. The peculiarities by which the Doric dialect was distinguished from the other varieties of the Greek language are to be attributed to the mountain life of the Dorians in their earliest settlements. We always find a tendency to the formation of broad vowel sounds in the language of mountaineers, and this fondness for the *α* and *ω*, which the Dorians generally used where *η* and *ο* were used in other dialects, and also their aversion to sibilants, is perfectly analogous to what we observe in other languages which are spoken both by highlanders and lowlanders. The use of the article in the Greek language is attributable to the Dorians, the poetry of Alcman having first introduced it

into the literature of Greece. The older language, which is called the *Æolian* or *Pelasgian*, and to which, according to Strabo, pp. 333 and 679, the Doric bore the same relation as the Attic did to the Ionian, was entirely without the article, as we may see in the Latin branch of it. On the Dorian dialect the reader may consult in addition to Maittaire and Gregory of Corinth, who have written on the Greek dialects in general, the excellent remarks of Müller, *Dorians*, vol. ii., Appendix viii., p. 484, &c., English translation.

DORIC ORDER. [CIVIL ARCHITECTURE; COLUMN.]

DORIPPE (Fabricius), a genus of brachyurous decapod crustaceans belonging to the subdivision which have the feet of the fourth and fifth pairs elevated on the back, and not terminated with paddles, and the eyes supported upon simple peduncles (*Notopoda*). The genus is adopted by Latreille, Lamarck, Leach, Bosc, and Risso: it is the *Notogastropus* of Vosmaer, and was comprehended under the general term *Cancer* by Linnæus, Herbst, Aldrovandus, and Plancus.

Generic character.—External *antennæ* rather long, setaceous, inserted above the intermediate ones, which are folded (pliées), but not entirely lodged in the cavities where they take their insertion: third joint of the external *jaw-feet* (pieds-mâchoires) straight, elongated, terminated in a point, *buccal opening* triangular: *claws* (chêles) small, short, equal; the other *feet* very long and compressed; the third pair being the greatest; the two last pair elevated upon the back, and terminated by a small hooked nail, which is folded back upon the next joint: *carapace* slightly depressed (the sides wider posteriorly than they are anteriorly), truncated, and spinous before; truncated, sinuous, and bordered behind; the surface marked with small humps or tubercles, which correspond exactly to the regions proper to the soft parts beneath: two great oblique openings, ciliated on their edges, communicating with the branchial cavity, and situated below the head, one at the right, the other at the left of the mouth: inferior and posterior part of the body truncated into a kind of gutter to receive the reflected abdomen, the pieces of which are nodulous or tuberculous: *eyes* small, lateral, supported on rather long peduncles, placed near the angles of the head, and protected by its angular projections, which form the edges of their orbits. (Desmarest.)

Geographical Distribution.—Probably wide on the sea-coasts of warm climates, where the water is deep. The Mediterranean and Adriatic seas, and Manilla, are among the localities given.

Habits.—Not well known. The species haunt great depths in the sea, nor has it yet been proved whether they make use of the feet elevated on the back to cover themselves like the *Dromia* with foreign bodies. It is however very probable that such is their use.

Example, *Dorippe lanata*, Latreille, Lamarck; *Dorippe Facchino*, Risso; *Cancer lanatus*, Linnæus; *Cancer herutus alius*, Aldrovandus.

Description.—Four dentations in the front and a very strong lateral point, forming at the same time the angle of the head and the external border of the orbit. A short point on the middle of each side of the carapace. Anterior border of the thighs of the second and third pair of feet without spines. Fingers of the chelæ compressed and arched within, having their internal edge armed with a series of dentilations, which are rather strong, oblique, equal, and white. Body often covered with reddish down.

Dorippe lanata.
a, external left jaw foot.

Locality.—the Mediterranean and the Adriatic. The inhabitants of Rimini call it *Facchino*. (Desmarest.)

FOSSIL DORIPPE?

Desmarest (*Histoire Naturelle des Crustacés Fossiles*, 1822), describes a species, *Dorippe Rissoana*, which has some resemblance to the species above figured and described, and still more to the crab figured by Herbst under the name of *Cancer Frascense*; and above all, to a species brought from New Holland by Péron, and named *Dorippe nodosa*. Desmarest observes that he is the more inclined to consider it as approaching very near to this last, inasmuch as he had thought that the specimen which he had described might not be in reality fossil. In fact, he adds, that though brown and shining, like the fossil crabs which come from the East Indies, it is much lighter, more friable, and not so much imbedded in the clay as they are. In his 'Considérations Générales sur la Classe des Crustacés,' (1825,) he describes the *Dorippe à quatre dents* with the synonyms *Dorippe quadridens*, Fabr. Latr.; *Dorippe nodosa*, Coll. du Mus.; *Cancer Frascense*, Herbst. 'This *Dorippe* from the East Indies,' he adds, 'has lately been brought from Manilla by M. Marion de Prouté. It so much resembles a species which I have described with doubt as fossil, that I know not how precisely to point out the difference. This species belongs to M. Deffrance, who has stated its characters in the article 'Dorippe' (fossil) of the Dict. des Sc. Nat.'

DORKING. [SUMMARY.]

DOROG, a market town of eastern Hungary, in what is called the 'Haydu Varosok,' or privileged district of the Haydukes, lying north-east of Bészörmény, the head town of that district, in 47° 30' N. lat. and 21° 20' E. long. (according to the Austrian quartermaster-general's map). It contains about 920 houses and 6650 inhabitants.

DORPAT, or **DOERPT**, a circle in the north-eastern part of the Russian government of Livonia; bounded on the north by Esthonia, and lying in the large subdivision of the empire, called 'The Provinces of the Eastern Sea,' or Baltic. It has an area of about 4267 square miles, and contained, in 1792, 130,904 inhabitants; in 1816, 140,606; and in 1833, 179,819. There are 2 towns (Dörpt, or Dörpat, and Verroe), 20 parishes, 206 equestrian estates, and 15,331 small farms in the circle. Ridges of low hills and gentle eminences occur alternately with lakes, streams, marshes, forests, and cultivated plains: the largest lake, next to its eastern boundary, lake Peipus, the western side of which, together with a portion of the bay of Pskow, belongs to this circle, is the Vürzyerva, which is navigable, and discharges its waters through the river Embach into the Peipus. Independently of the Little Embach, which enters lake Vürzyerva from the south, and the Great Embach, which flows out of that lake into the Peipus, and is navigable from the town of Dörpat, the circle has no streams of any note: one of them, the Schwarzbach, contains pearls. The forests are of considerable extent, and in conjunction with the cultivation of buckwheat, flax and hemp, and the fisheries, afford employment to the people. A considerable quantity of cattle are reared. The only mechanical occupations are sawing timber, for which there are 18 mills, and making potashes, and a small quantity of paper. Verroe, the second town, which lies on a lake in 57° 46' N. lat. and 27° 3' E. long., has a Lutheran and a Greek church, and about 3500 inhabitants.

DORPAT, or **DOERPT** (in Esthonian, Tart Ling, and in Livonian, Tehrpata), the chief town of the circle, is agreeably situated at the foot and on the declivity of an eminence, part of a range of hills, about 200 feet high, which rise abruptly from the spacious plain below, and is built on each bank of the Great Embach, in 58° 22' N. lat. and 26° 42' E. long., 290 versts (about 193 miles) north-east of Riga. The river is crossed by a handsome bridge of granite of three massive arches, and the town, which is embellished with gardens, forms a semicircle, laid out in straight broad streets, which are kept very clean, and adorned with some handsome public buildings of freestone, particularly the government offices and university buildings. The houses, constructed either of bricks or wood, the walls and roofs of which are painted in showy colours, do not in general exceed one story in height. The eminence, at the north-western extremity of the town, is approached from one of the principal squares, and laid out in avenues and walks: the summit is called the 'Place of the Cathedral,' from its having been the site of a cathedral which was burned down

in the great fire of 1775, and is at present the site of an observatory, admirably supplied with instruments by the well-known astronomer, Dr. Struve, as well as of the university library and medical school. In the middle of the sixteenth century Dörpat had a cathedral and seven churches within the walls, besides three outside of them, but at present it has only one Lutheran and one Greek church. In 1782 it had 546 houses and 3603 inhabitants; in 1816 the population had increased to 7376; and at present the number of houses is about 1200, and the population is about 11,000. In 1833 it was 10,802; viz., 5011 males and 5791 females; and in 1835 the births were 772 and the deaths 653. Internal trade, the navigation of the Embach, and the wants of those who are connected with the university afford employment to the people of the town. They also hold a large annual fair in January for the sale of Russian and foreign manufactures. The university was founded in 1632 by Gustavus Adolphus, at a time when Livonia, Esthonia, and Ingria, belonged to the Swedish crown, but was suppressed by Alexis Michaelovitch in 1656. The Swedes having however recovered possession of Livonia, it was re-established in 1690: in 1699 they transferred it to Pernau; and in December, 1802, it was reconstituted by the Emperor Alexander for the benefit of Livonia, Esthonia, and Courland, the nobility of which elect a curator or superintendent, who, conjointly with its heads, administers its revenue, which amounts to about 5800*l.* a year (126,000 roubles). The university, which is open to students of every religious persuasion, consists of the four faculties of theology, law, medicine, and philosophy; has 30 professors, and is attended by about 580 students. It has a library of nearly 60,000 volumes, and suitable collections for natural and experimental philosophy, mineralogy, zoology, anatomy, and pathology, &c.; a botanical garden, clinical institutions, a theological and a philological seminary, an establishment for educating Russian professors, a gymnasium, and a school for educating teachers in the elementary schools. Public education throughout Livonia, Esthonia, and Courland, is under the direction of the University of Dörpat.

DÖRR-HAWK. [GOATSUCKERS.]

DORSET. [SACKVILLE.]

DORSETSHIRE, an English county, bounded on the east by Hampshire, on the north by Wiltshire, on the north-west by Somersetshire, and on the west by Devonshire: along all its southern borders it is washed by the English Channel. Dorsetshire is for a short distance separated from Hampshire by a rivulet which joins the Avon of Wiltshire and Hampshire above Christchurch: for a short distance it is separated from Somersetshire by the Ivel or Yeo, and the brooks that run into it; and in the west it is separated from Somersetshire and Devonshire by the Axe and some small streams that run into that river.

The form of the county is very irregular, and one small part is entirely detached from the rest and inclosed by Devonshire. Its greatest length is from east to west, from Alderholt, near Fordingbridge, in Hampshire, to the western extremity of the detached part, which is inclosed within the boundary of Devonshire, 57 or 58 miles: but from the irregular course of the boundary, the line joining these two points is not wholly in Dorsetshire. The breadth from north to south varies much; the greatest breadth is from the spot where the river Stour enters Dorsetshire to Portland Bill or Point, 40 miles: at the eastern extremity, along the Hampshire border, the breadth is 16 miles; at the western extremity, near Lyme Regis, only 5 miles. The area, as given in the table in Arrowsmith's large map of England and Wales, and in the population returns, is 1006 square miles, or 643,840 acres: the population in 1831 was 159,252, or about 158 to a square mile. In respect of size, it is below the average of the English counties; and in respect, both of amount and density of population, very much below. Dorchester, the county town, is 115 or 116 miles from St. Paul's, London, in a straight line south-west by west, or 119½ from Hyde Park Corner by the road through Basingstoke, Andover, Salisbury, and Blandford.

Dorsetshire is included between 50° 30' and 51° 5' N. lat., and 1° 48' and 3° 7' W. long. Dorchester is in 50° 43' N. lat. and 2° 26' W. long.

Coast, Bays, and Islands.—At the eastern end of Dorsetshire the coast is precipitous; but the cliffs extend scarcely a mile south-west from the border of Hampshire, and are succeeded by a low sandy tongue of land, running about a mile farther in the same direction to the narrow entrance

of Poole harbour. This bay penetrates six miles inland towards the west, and expands to a breadth of four or five. Its outline is very irregular, and it forms several small bays; as Hole's Bay, Lytchet Bay, Arne Bay, &c. It receives the Frome, the Piddle, and other streams: it consists for the most part of banks of mud, which are dry at low water, and covered with sea-weed, and are separated from each other by deeper channels. The town of Poole is on a peninsula at the entrance of Hole's Bay, on the north side of the harbour. There are several islands in Poole harbour; Brownsea or Brownsey, the largest, which lies near the entrance of the harbour, is a mile and a half long from east to west, and nearly a mile broad. It is sandy, partly covered with heath, furze, and fern, and partly cultivated or laid out in a plantation. There are on it an old castle and one or two tenements. The water is so shallow in Poole Harbour, except in the channels, that only small or lightly-laden boats can pass over the banks, even at high water; several of the channels are only sufficient for fishing boats and small craft: the Wareham and Main channels, the south or Wych channel, and that which leads to the town of Poole, are navigable for larger vessels. The shore round Poole harbour is low, and near where the Frome falls into it the land is protected from inundation by an embankment.

From the entrance of Poole harbour a low shore runs southward nearly three miles, and then becomes steep and turns eastward, forming Studland Bay, the southern limit of which is Handfast Point. From Studland Bay, the coast, still for the most part abrupt, runs about 4 miles south by west to Peverel Point and Durlston Head, forming the two small bays, Swanage or Swanwich Bay and Durlston Bay. From Durlston Head a precipitous coast runs west by south 5 miles to St. Aldhelm's or St. Alban's Head (344 feet high B.), and from thence in an irregular line west by north 17 or 18 miles to Weymouth Bay, forming several small bays, such as Chapman's Pool, Kimmeridge Bay, Worbarrow Bay, Lulworth Cove, and Ringstead Bay. The cliffs which extend from Peverel Point to the neighbourhood of Weymouth are a longitudinal section of the high land which forms this part of the coast.

The shore of Weymouth Bay is low, and extends 2 miles south to the towns of Melcombe Regis and Weymouth: here the cliffs recommence, and run 1 mile south-west to Sandsfoot Castle, from whence a low shore extends 2 miles south by east to Portland Castle, on the peninsula or Isle of Portland. The lofty coast of this island takes a circuit of 5 or 6 miles to the Bill of Portland, the southernmost point of the county, and from thence above 3 miles northward to the commencement of the Chesil Bank, which connects the north-west extremity of the Isle of Portland with the main land. The bay between Weymouth and the Isle of Portland is called Portland Road.

The Isle of Portland is about four miles long, and in the widest part nearly one and a half broad. It is one continued bed of rock or freestone. The highest point in the island is 458 feet (B.) above the level of the sea: the cliffs on the western side are very lofty; those at the Bill are not more than 20 or 30 feet. There is sufficient depth of vegetable soil to render the island tolerably productive, but not sufficiently so for the entire sustenance of the population, who get much of their provisions from Weymouth. Water is plentiful and good; one stream has sufficient volume to turn a mill. The herbage is very fine, and affords pasturage to a number of sheep, whose flesh is considered to be excellent mutton. In wet seasons the meadows produce a good crop of grass, but in a dry spring it is so much parched as not to be worth mowing. The arable land is mostly common field; what inclosures there are, are bounded by stone fences: wheat, oats, peas, and a little barley are grown; sainfoin is also cultivated. The grain harvest is small, but the corn is fine, and in request for seed. There are very few trees in the island except a few elms in the southern part: and from the scarcity of other fuel, the islanders are obliged to use dried cow-dung mixed with the stubble of their corn, which they gather for the purpose. (Hutchins's *Dorsetshire*, vol. ii. p. 354, 2nd edit., Lond., 1796-1815.) The whole island is included in one parish, which contained in 1831 a population of 2670. The islanders are a robust race, peculiarly adapted to the hard labour of quarrying stone, in which a considerable number are employed: they are not long-lived, which is ascribed to their free use of ardent spirits. (Hutchins's *Dorsetshire*.) They occasion-

ally engage in fishing, and some few are employed in agriculture, trade, and handicraft. The custom of gavelkind prevails here. The island has one village, Chesilton, at the commencement of the Chesil bank, on the north-west side of Portland: there are several hamlets. There are two castles; one, on the east shore of the isle, is very antient, and built in the form of a pentagon, with a number of small loop-holes, whence it has been vulgarly called 'Bow and Arrow Castle:' it is sometimes called Rufus's Castle. The other is on the northern side of the island, built by Henry VIII., and, in connexion with Sandsfoot Castle, commands Portland Road: a few guns are still mounted. Near the Bill are two lighthouses. The quarries will be noticed hereafter. Masses of rocks extend under water to a considerable distance from the island. A dangerous surf, called 'The Race of Portland,' extends from the west of the island eastward to St. Aldhelm's Head. Portland Road is sheltered from the south-west wind, and affords good holding ground at eight or nine fathoms.

Leland, Hollinshed, and Camden agree in speaking of Portland as having been once separated from the main land; but it has long been united to it by the Chesil Bank, one of the longest and most extraordinary ridges of pebbles in Europe. From its commencement at the Isle of Portland, near the village of Chesilton, to which it gives name, it extends in a remarkably straight line north-west for many miles, not joining the shore at the part nearest to Portland, but running parallel to the coast, from which it is separated by a narrow arm of the sea called 'The Fleet,' as far as Abbotsbury, 10 miles from Portland: here it unites with the main land and runs along the shore nearly six miles further to the commencement of the cliffs at Burton Castle, not far from Bridport. The breadth of the Chesil Bank is in some places near a quarter of a mile, but commonly much less. The base is formed of a mound of blue clay, which is covered to the depth of four, five, or six feet, by a coat of smooth round pebbles, chiefly of white calcareous spar (these are called Portland pebbles), but partly of quartz, chert, jasper, &c., so loose that a horse's legs sink almost knee deep at every step. The bank slopes on the one side toward the open sea, and on the other toward the narrow inlet intercepted by it: it is highest at the Portland end, and is there composed of pebbles as large as a hen's egg; but they diminish in size towards the west so regularly, that it is said the smugglers who land in the night can judge where they are by examining the beach; at Abbotsbury they are little bigger than horse-beans. Marine plants grow in patches along the edge of the bank by the water-side. The pebbly covering is continually shifting: a north-east wind sometimes clears away the pebbles in parts, leaving the blue clay exposed; but the denuded spaces are covered again with pebbles by the heavy sea which the south-west wind brings up. 'The Fleet' receives the water of several rivulets, and runs into the open sea at its south-eastern extremity by a narrow channel called 'Small Mouth:' it is in some places half a mile broad; there are two or three passages or causeways over it. At the north-western extremity it forms a 'swannery,' which once consisted of 7000 swans. The Fleet is much frequented by water-fowl, among which Dr. Maton observed the wild swan. (Hutchins's *Dorsetshire*; Smeaton's *Hist. of the Edystone Lighthouse*; and Maton's *Western Counties*.)

From Burton Castle the coast, generally abrupt and frequently high, runs W.N.W. ten or twelve miles to the border of Devonshire: the cliffs in this part are remarkable for the beauty and variety of the fossils which they contain. The whole extent of the Dorsetshire coast, including the circuit of the Isle of Portland, may be estimated at above 75 miles.

What is sometimes called 'the Isle of Purbeck,' being really a part of the main land, is not noticed here; it comprehends the peninsula formed by the river Frome and Poole Harbour on one side, and the sea on the other.

Surface, Hydrography, Communications.—The surface of this county is for the most part uneven. The principal elevations are the chalk downs, which, entering Dorsetshire from Wiltshire on the northern side of Cranbourne Chase, two or three miles south-east of Shaftesbury, turn to the south, and run to the valley of the Stour, in the neighbourhood of Blandford. In this range of downs, some parts of which are covered with wood, are Melbury Down, Ashmore Down, Fontmell Down, Iwerne Free Down, Bushy Down,

Preston Down, Main Down, Gunville Down, Pimperne Down, Stowerpaine Down, Furze Down, Camp Down, and Mill Down, with the outlying eminences Hod Hill and Hamilton Hill. From the valley of the Stour the chalk downs run nearly west to the neighbourhood of Beaminster, and form the northern boundary of the basin whose drainage is received by Poole Harbour. In this part we have Okeford Hill, Bell Hill, White Hill (between the last two is Bulbarrow, 927 ft. high) (A.), Great Ball, Little Ball, Revels Hill, Dogberry Hill, High Stoy, 891 ft. (A.), Highcombe Hill, Row Hill, East Hill, West Hill, Evershot, Rampisham, Corscombe, and Beaminster Downs, Whitesheet Hill, and Horn Hill. The foregoing eminences belong to the range of the 'North Downs,' and lie along the northern escarpment of that range. The hills near Beaminster form, with the exception of some outlying masses, the western extremity of the great chalk formation. The chalk hills from Beaminster run south-east or east, and form 'the South Downs,' the highest points in which are along the southern escarpment. The hills gradually approach the coast a few miles north-east of Melcombe Regis. In this range we have Hackthorn Hill, Chilfrome Down, Eggardon, where is an old entrenchment, Chilcombe Hill, Little Bredy Down, Black Down, 817 ft. (A.), Whaddon Down, Ridgeway Down, and Bincombe Down (if these be not two names for the same), Came Down, Moignes or Maine Down, Holworth Down, and Chaldon Down. From Lulworth the chalk hills run eastward to Handfast Point, the headland which separates Studland and Swanage Bays. In this part of the range are Purbeck Hill, Knowl or Norden Hill, west of Corfe Castle, 369 ft. (B.), Corfe Castle Hill, 207 ft. (B.), Challow Hill, east of Corfe Castle, 390 ft. (B.), Nine Barrow Down, 625 ft. (B.), or 642 ft. (O.), and Ballard Down.

Pilledon Pen, west of Beaminster, which is 934 ft. high (O.), is the highest point in the county, and belongs to the green sand formation. Swyre Hill, on the coast, near Kimmeridge, in the Isle of Purbeck, is 669 ft. high. (B.) For the above elevations we have given our authorities: O. the Ordnance Survey; A. Arrowsmith's 'Map of England and Wales;' and B. Dr. Berger in 'Geol. Trans.' vol. i. p. 268.

The Stour, the chief river of Dorsetshire, rises in Wiltshire, in Stourhead Park, on the border of Somersetshire, and running south-by-east, enters Dorsetshire between 3 and 4 miles from its source. After flowing about 4 miles farther in the same direction, it receives the Shreen Water from the north, and soon after the Lidden River from the north-east. It then flows in a very winding channel, south-south-east, for 8 miles, to the junction of the Cale, which comes from the neighbourhood of Wincanton, in Somersetshire. From the junction of the Cale the Stour flows south about 3 miles to the junction of the Lidden, and thence winds to the east past the town of Sturminster Newton, and through a depression in the range of the North Downs, and passes in a south-east course to the town of Blandford Forum, after which it flows south-east for 20 miles to the village of Corfe Mullen; and from thence 4 miles east to the junction of the Allen, which flows from the north near Cranbourne. After it receives the Allen the Stour flows east-south-east 6 or 7 miles into Hampshire, after entering which it receives a considerable stream, 16 or 18 miles long, from Cranbourne; and about 4 miles lower it joins the Avon near Christchurch, in Hampshire. The whole course of the Stour is nearly 65 miles, for 40 of which, viz. up to Sturminster Newton, it is navigable.

The river Yeo, Ive or Ivel, is formed by two brooks, one rising in Somersetshire, and one in Dorsetshire, which uniting near Milbourne Port (Somersetshire), and flowing south-west, enter Dorsetshire between Milbourne Port and Sherbourne, about three miles from their respective sources. The Yeo then flows first west-south-west, then west-north-west for about seven miles, when it again touches the border of Somersetshire, along which it winds for about three miles, and then entering Somersetshire flows north-west into the Parret. The Stour and the Yeo carry off the drainage of all that part of the county which lies north of the North Downs.

The North and South Downs inclose the basin of the two rivers Piddle or Trent and Frome, which unite in Poole Harbour below Wareham, and from their situation with respect to that town are respectively called Wareham North and Wareham South river. The Piddle rises in the village of Alton on the southern declivity of the North

Downs, and flows south and south-east past Piddletrenthide and Piddleslinton to Piddletown. From Piddletown it has a general east-south-east course to its entrance into Poole Harbour. Its whole course is about twenty-two miles; or, if we add seven or eight for the length of the low water channel through the estuary of Poole Harbour, 30 miles.

The Frome rises on the Downs near Corscombe, north-east of Beaminster, and flows south-east. At Maiden Newton it receives a stream from the Downs near Beaminster. From Maiden Newton the Frome flows south-east eight miles to Dorchester. From Dorchester the Frome flows east nearly twenty miles into Poole Harbour, just upon entering which it unites with the Piddle, and has the same low water channel as that river: its whole length is about thirty-five miles, or, including the channel through Poole Harbour, forty-two or forty-three miles. For a considerable part of their course both the Frome and the Piddle flow through low meadows; the channel of each is repeatedly divided and reunited. They are not navigable, at least above Wareham.

The western extremity of the county is watered by the Bredy, the Brit, the Char, and the Axe, which last rather belongs to Devonshire. The Bredy flows westward seven or eight miles from Little Bredy into the sea, near Burton Bradstock, at the north-west extremity of the Chesil Bank. The Brit rises near Beaminster on the southern slope of the chalk hills, near the junction of the North and South Downs, and flows south about nine miles into the sea below Bridport: the mouth of it forms Bridport Harbour. The Char is about as long as the Brit; it rises near Pillesdon Pen, and flows south and south-west into the sea at Charmouth: it receives many brooks. The Axe rises in Dorsetshire, and flows for some miles along the border of the county.

Dorsetshire has no canals. The Dorset and Somerset canal, for which acts were obtained in 1796 and 1803, but which was never executed, was to have entered the county near Stalbridge, and to have followed the valley of the Stour till it opened into that river above Blandford Forum. The intended English and Bristol Channels' ship canal was to cross the western extremity of the county. There is a short railway from the clay pits at Norden, near Corfe Castle, to the Quay on Middlebere Channel, Poole Harbour.

The Penzance, Falmouth, and Exeter mail-road crosses the county in nearly its whole extent. It enters it near Woodyates' Inn, between Salisbury and Blandford, and runs south-west through the latter town, Winterbourne Whitchurch, Milbourne St. Andrew, and Piddletown to Dorchester; and from thence west by Winterbourne Abbas, Bridport, Chidcock, and Charmouth to Axminster in Devonshire. The Exeter mail-road crosses the northern part of the county, entering it near Shaftesbury, and running thence sometimes in Somersetshire and sometimes in Dorsetshire, by Sherbourne to Yeovil in Somersetshire. It just crosses the western extremity, and the detached portion of the county between Chard and Honiton. The Falmouth, Devonport, and Exeter mail-road also just crosses the western part of the county. The Southampton and Poole mail-road enters the county beyond Ringwood, and runs by Wimbourne Minster to Poole. Roads run from Dorchester to Weymouth, to Wareham, Corfe Castle and Swanage, to Beaminster and Crewkerne, and to Sherbourne; from Shaftesbury to Sherbourne, to Sturminster Newton, and to Blandford, and from Blandford to Wimbourne.

Geological character.—The direction of the chalk-hills, which has been already noticed, furnishes the key to the geological structure of Dorsetshire. The North and South Downs, which respectively extend westwards from the neighbourhood of Shaftesbury and the Isle of Purbeck, and unite at their western extremity near Beaminster, inclose a basin, 'the Trough of Poole,' in which we have the formations superior to the chalk; beyond or without this basin we have the formations which underlie the chalk.

The eastern part of the county, as far as Cranbourne, Chisbury and Wimbourne Minster, and the Trough of Poole (bounded on the north by a line drawn from Wimbourne by Bere Regis and Tulpiddle to Stinsford near Dorchester, its western extremity, and on the south by a line drawn from Broad Mayne along the northern slope of the South Downs to Studland bay) are occupied by the plastic clay. The undulations of the surface occupied by this formation are considerable. Potters' clay in beds of various thickness and at different depths alternates with loose sand in this formation in the Trough of Poole. It is sent to Staffordshire, where

it is mixed with ground flints and employed in the finer kinds of pottery. Beneath the potters' clay lies a seam of very friable earthy brown coal, which crumbles when put into water, burns with a weak flame, emitting a particular and rather bituminous smell, somewhat like Bovey coal. An extensive horizontal bed of pipeclay skirts the northern declivity of the South Downs, and it contains a bed of coal exactly resembling that of Adam Bay in the Isle of Wight; clay of the same bed, but not of equal quality, may be found in other parts of the Trough of Poole. It is quarried extensively near the town of Poole, where clay for fire-bricks is also dug. Near Handfast Point the sand of this formation passes into sandstone. The plastic clay is found capping one or two hills south-west of Dorchester.

The chalk formation bounds the plastic clay. In the North Downs the chalk occupies a breadth of nearly ten miles, viz., from Shaftesbury to Cranbourne and along the valley of the Stour from above Blandford to Wimbourne Minster: at its western extremity the formation is still broader, extending about eighteen miles from beyond Beaminster to Stinsford near Dorchester. On the southern side of the Trough of Poole it becomes much narrower, scarcely averaging two miles in breadth. The cliffs along the south coast are partly chalk: the strata are in some places curved and occasionally vertical. The valleys, drained by the upper part of the Frome and its tributaries, are occupied by the green sand, so that the mass of the chalk-hills about Beaminster is cut off from the rest of the formation.

The remainder of our geological notice must be arranged in two parts: the first referring to the district south of the chalk range and extending to the coast: the second referring to the district west and north-west of the same range. We shall first speak of the southern districts.

The chalk marl, green sand, weald clay, and iron sand skirt the chalk in the order in which we have named them in the Isle of Purbeck, and extend along the coast between the chalk and the Purbeck and Portland limestone next to be noticed. The iron sand near Lulworth contains imperfect beds of wood-coal. The weald clay is not found along the coast west of the Isle of Purbeck.

The Purbeck strata, belonging to the upper series of the Oolitic formation, consist of argillaceous limestone alternating with schistose marle: they crop out from under the iron sand in the Isle of Purbeck. A variety of the Purbeck stone, known as Purbeck marble, was formerly much used for columns and ornaments in our cathedrals and old churches, but is now out of use. The thickness of the Purbeck beds is estimated at 290 feet. The Portland Oolite, another member of the same series, which succeeds the Purbeck stone, occupies the remainder of the Isle of Purbeck and the whole of that of Portland. It consists of a number of beds of a yellowish white calcareous freestone, generally mixed with a small quantity of siliceous sand. But the different beds of which it is composed often vary in their characters, nor are the same beds of an uniform character in different localities. The varieties of this formation afford the greater part of the stone used for architectural purposes in London.

The Portland stone came into repute in the time of James I., who used it by the advice of his architects in rebuilding the banqueting-house at Whitehall. After the great fire of London, A.D. 1666, vast quantities of this stone were used in rebuilding St. Paul's and other public edifices. A considerable portion of Westminster Bridge and the whole of Blackfriars Bridge are built of it. The quarries are thus described by Mr. Smeaton in his 'Narrative of the Building, &c., of the Edystone Lighthouse':

'The first thing that excited my curiosity was the very subject I came upon; that is, the quarries from whence the stone sent from Portland is produced. The upper surface of the island I found was totally flat, but elevated above the sea, according to the estimation of my eye, at least 200 feet.* The stratum of stone, that is wrought for sale, lies nearly parallel with the upper surface of the island, and with not much cover of earth or rubbish upon it. There are several beds of stone, lying in contiguity one above another, varying in thickness in general from two to four feet, and upward. Those which are usually called the merchantable beds (on account of the blocks for sale being produced therefrom) are universally covered with a stratum called the cap, which is formed entirely of a congeries of petrified sea shells of a great variety of kinds, but in general so distinct and

* The highest point as we have seen is much higher than this.

separate in their forms that to the curious naturalist their species seem very easy to be made out; but as they, in a considerable degree, retain their respective figures (though in some places more, in some less), spaces or cavities are left between them, which consequently very much diminish the coherence of the mass; but yet the cementing principle is so strong that the whole together is considerably harder than the merchantable beds; and indeed so hard that, to get rid of it as easily as possible, it is generally blasted off with gunpowder. Were it not for these cavities the capstone would not readily be worked with tools; or, at least, it would not be worth working at a place where there is so great a plenty of stone of a better quality; but as it is necessary to remove it in the course of working the better kind of stone, though by far the greatest proportion is blasted into fragments, yet for the buildings in the island the capstone is in general used, and also for the piers and quay walls of Weymouth harbour; as also in the pier for shipping stone at Portland blocks are used from the cap; and indeed were it not for the expense of freight (which is the same as upon those of the best quality) for various rough purposes under water, &c., the cap would make quite as good and durable work as the merchantable blocks.

When the merchantable beds are thus cleared of the cap, the quarry-men proceed to cross-cut the large flats, which are laid bare with wedges in the way I have described as to the moorstone: only the wedges are not so numerous, nor does Portland stone split so evenly as granite; and frequently in the splitting as well as other working of this stone, oysters and other fossil shells are discovered in the solid substance of the merchantable stone. The beds being thus cut into distinct lumps, the quarry-man, with a tool called a kevel, which is at one end a hammer and at the other an axe, whose edge is so short or narrow that it approaches towards the shape of a pick, by a repetition of sturdy blows soon reduces a piece of stone with his eye to the largest square figure which it will admit, and blocks are thus formed from half a ton to six or eight tons' weight, or upwards, if particularly bespoken.

The strata of stone of all kinds on the east side of Portland have an aggregate thickness of 93 feet, on the west side of 112 feet. The 'cap' is at present only burnt for lime. The Kimmeridge clay, a blue slaty or greyish yellow clay which also belongs to the upper Oolitic series underlies the Portland stone: it sometimes contains beds of a highly bituminous shale, which from their being found near Kimmeridge in the Isle of Purbeck, have obtained the name of Kimmeridge coal, and have given to the whole formation the name of Kimmeridge clay. The shale burns with a yellowish flame, giving out a sulphureous smell. The thickness of the Kimmeridge clay is estimated at 600 or 700 feet. It forms the base of the Portland Oolite in the Isle of Portland, and the line of junction between the two formations is elevated on the north side of the island far above the level of the sea. The coasts of the island are here formed by a sloping bank of Kimmeridge clay, surmounted by an abrupt escarpment of Oolite. On the south side of the island by the dip of the strata towards the south the line of junction is brought down to the level of the sea.

Towards the south-western shore of the Isle of Purbeck where the chalk downs approach the sea, and are skirted only by a very narrow belt occupied by the iron sand, and beyond that seaward, by the Portland Oolite, the sea has formed several singular coves, at the entrance of which are lofty headlands of Oolite; while the cove or basin is excavated inland as far as the chalk. The precipitous sides of these basins exhibit in a most striking manner the formations between the chalk and the Oolite.

Westward of the coves just described, extending from Weymouth bay towards the river Brit, occurs what is termed by Geologists 'a saddle,' a double series of formations. After the green sand, Purbeck, and Portland beds, and Kimmeridge clay have successively cropped out from beneath the chalk, the coral rag and Oxford clay, members of the middle series of Oolites rise to the surface in succession, and are succeeded by the Forest Marble and the Great Oolite, which belong to the lowest series of the Oolitic formations. To the southward of the Great Oolite and Forest Marble the superior strata re-appear in reverse order of succession; the Oxford clay, then the coral rag, and then the Kimmeridge clay, which runs down to the shore at Weymouth, and rises again from the sea in the Isle of Portland, where it appears capped with the Portland Oolite.

In the north-western and western parts of the county, the chalk formation is succeeded by the green sand, which crops out from beneath it, and skirts the northern side and the western extremity of the North Downs. The green sand forms the outlying masses of Pilsdon and Lewston hills, and of others yet farther west along the border of Dorsetshire and in the county of Devon. [DEVONSHIRE.] Neither the iron sand nor the weald clay, nor so far as we are aware, the chalk marl, appears to be found in this part of the county.

West of Shaftesbury extends a bed of Kimmeridge clay which crops out from under the green sand: west of the Kimmeridge clay is a range of coral rag hills; and still further west occur the Oxford clay, and the Great Oolite. All these formations are overlaid by the westward extension of the chalk and green sand from the valley of the Stour to Beaminster; but some of them re-appear in the cliffs which line the coast westward of the Chesil Bank.

The western extremity of the county is occupied by the lowest members of the Oolitic series and by the Lias. The line of junction of these formations extends nearly north and south from Ilminster in Somersetshire to the sea. Insulated masses of green sand frequently cover both the Oolites and the Lias, and render it difficult to trace the line of junction. The detached part of the county which is enclosed within Devonshire is partly occupied by the red marl foundation.

Agriculture.—The climate of Dorsetshire, though mild and healthy, is not so warm as its geographical situation would lead us to expect; a circumstance owing to the nature of the soil and the bareness of its chalk hills, there being little or nothing to break the force of the winds that sweep over them. The air is keen and bracing, rather than soft and warm. In the valleys, the climate resembles that of the valleys of Devonshire, and the vegetation is very similar. It appears from Domesday Book that there were vineyards at that time in several parts of this county. At present the harvest is not in general earlier than in the midland counties: and although snow seldom lies long on the ground, the land is not fit for sowing in spring sooner than in many parts of England where the winters are more severe.

A considerable portion of the soil in the south-eastern part of this county is similar to that of Bagshot Heath, and not more fertile, being a loose sand and gravel, with a portion of ferruginous loam. The whole surface of the county consists chiefly of this loose sand and gravel, clay and chalk. The most fertile spots are those where all the three have been mixed in the valleys by the rivulets which run down the hills carrying the soil with them. The poor sandy soil occupies that part of the county which joins Hampshire. In the centre and towards Wiltshire lies the chalk; and along the coast, over a more solid chalky rock, is a stratum of clay, which likewise covers the western part towards Devonshire, and the northern towards Somersetshire.

The following division of the soils is given in the 'Agricultural Report of the County,' by Stevenson:—

| | |
|-------------------------|----------------|
| Chalk | 160,759 Acres. |
| Sand | 85,157 " |
| Loam | 37,746 " |
| Gravel | 59,894 " |
| Miscellaneous | 13,427 " |
| Stone Brash | 29,700 " |
| Clay | 117,331 " |

Total 504,014

Exclusive of rivers, towns, roads, &c.

The chalk hills to the west of Dorchester, and along the borders of the vale of Blackmore, are of considerable elevation, and contain several narrow vales and deep hollows. The soil on the most elevated parts of the chalk district is a thin loam over a rubbly chalk mixed with stones which lies on the solid chalk. It is most advantageous to let this soil remain as sheep-walk, the pasture being fine and short as in other downs. In the bottom of the vale of Blackmore are some extremely fertile meadows watered by the river Stour. The hills which look down upon this valley are high and bare; but the lower sides are beautifully varied with woods and fields.

The quantity of arable land throughout the county bears but a small proportion to the pasture; and greater attention is paid to the rearing of sheep and feeding of cattle than to the raising of corn. The implements of husbandry

are similar to those in use in Devonshire. The wheel-ploughs are preferred in stiff and stony soils; and it is usual to put three horses before them, two abreast, and the third before the near horse; so that the furrow being turned to the right, two horses walk on the unploughed ground, and one in the furrow; they are driven by a lad. Improved ploughs have been introduced; but the majority of farmers are slow in relinquishing the instruments which they have been early accustomed to. The nine-share plough, or scarifier, has been found very useful in the light soils, and saves much time in preparing the land for the seed, as it goes over a great width, and saves a ploughing.

On the larger farms the farm-houses are old buildings of, and covered with stone tiles; in the smaller they are mostly thatched with reed. Many cottages are built with mud walls composed of road scrapings, chalk, and straw. The foundation is of stone or brick, and on this the mud wall is built in regular layers, each of which is allowed to dry and harden before another is put over it. Garden walls are frequently built of these cheap materials, their top being protected from the weather by a small roof of thatch, which extends a few inches over each side. The farms are large, many having been laid together, in prosperous times, at the desire of the richer farmers, and with the concurrence of landlords, who found that the repairs on one large set of buildings are less than on many small ones.

The rent of land varies greatly. In the poor sands it is as low as 10s. or 12s. per acre; in the richer grass lands it is from 30s. to 40s.; some water-meadows let as high as 60s. or more. On the whole, the average rent of grass land is about 20s., of old meadow about 30s., the tenant paying the tithes, which seldom exceed 5s. per acre.

The old method of managing arable land, which is still followed by many farmers, was to fallow every fourth year on the clays, and then take two or even three crops of corn in succession. Where clover or grasses are cultivated, they are put in with the second crop, and consequently the land is not in a clean state. The most common rotation on the rich loams in the vale of Blackmore is: summer fallow—wheat—barley with grass seeds, which continue two or three years, and are then broken up again after the hay has been made, when a kind of bastard fallow succeeds, consisting of three ploughings, and the land is tolerably prepared for wheat; but it is not clean enough to prevent the necessity of a repetition of the summer fallow every sixth year at least. There is a practice with some farmers which deserves notice, as it is a step towards the system of double crops, by which the Flemish culture is rendered so much more productive than most other. It is as follows: the clover or grass of the second year is fed off early by sheep; the land is then ploughed up and sown with rape and spring tares, which give an abundant produce in autumn, on which the sheep are folded, and the land is thus well prepared for wheat. The time of sowing is about the end of May or beginning of June. A bushel of vetches and two quarts of rape-seed are the quantities sown on an acre. The crop is fed off by Michaelmas.

On the light chalky soils turnips have been very generally introduced, although they are not yet every where cultivated in the best manner.

The introduction of sainfoin on the dry chalky soils has been a great advantage, as it produces a rich fodder, requires little manure, and lasts many years. In this soil the wheat is generally sown after clover which has stood one or two years, but sometimes also after turnips or rape fed off. The folding of the land saves manure, and the vicinity of sheep downs gives an opportunity of having large folds and repeating the folding often, both before and after sowing the seed. The tread of the sheep consolidates loose soils better than the heaviest roller. The ploughing in the chalky soils is generally very shallow, because they say that the couch is thus more easily kept down; but those who plough as deep as the subsoil will permit find that their crops are more certain, especially in dry summers; and the couch is best eradicated by careful hand-picking after every ploughing.

Wheat is sown sometimes in the light soils as soon as August, and before the wheat crop of that year is ripe. The quantity sown is usually three bushels, and is increased as it is sown later. In the heavier loams the wheat is sown later, sometimes not much before Christmas; in that case a bushel more is required to allow for the grains that

perish, or are eaten by the birds, who are then more alert after their food. The early sown wheat is thought more subject to mildew. The seed is usually steeped and limed. When it is sown very early this precaution is frequently omitted. The average produce of wheat is from 17 to 20 bushels per acre.

Barley is here a more important crop than wheat. It is sown from the middle of March to the middle of May. The earliest sown is generally the best. The produce averages 30 bushels per acre. Oats are sown on the heavier and moister soils, at the rate of six bushels per acre. They think that the straw is better fodder where the oats are sown thick, but they perhaps forget that the heaviest grain is produced by sowing thin or drilling wide. Beans are planted or drilled in rows from 18 to 24 inches distant. In the rich loams of the vale the produce is considerable, from 30 to 40 bushels per acre, and often more. Turnips are generally sown broadcast, at the rate of three pounds of seed per acre; this gives an abundance of plants, which are thinned out by the hoe.

Potatoes are cultivated to a considerable extent in the rich loams about Bridport, Beaminster, Abbotsbury, &c.: they are planted in rows, or the sets are dropped in every third furrow after the plough. They are horse-hoed, and moulded up by a double mould-board plough: 24 bushels planted on an acre often produce 360. The beginning of May is the usual time of planting.

Sainfoin is sown with a spring crop: four bushels of seed are required for an acre. It is cut before the blossom is fully expanded and made into hay, which is excellent fodder for sheep in winter. After several years, when it begins to go off, it is ploughed up, and the land sown with oats. It is often advantageous to pare and burn the land after sainfoin; but as this practice is generally forbidden in leases, however advantageous it may be occasionally, a method is adopted which equally destroys the vegetable matter without burning the soil. This is to rib the land; that is, to plough furrows with intervals, and do this again across the first ribs; the sods are thus cut in squares, and the harrows passing over them leave the roots in the form of matted tufts, which are burnt, and the ashes spread to enrich the ground. A regular paring and burning would be much better, both for the landlord and the tenant. Sainfoin does not produce much the first year after it is sown, and consequently many farmers sow hop-clover with it, which being an annual gives a produce the first year, and fills the intervals of the sainfoin, which is in perfection, the second. The land which has borne sainfoin for some years is not sown again with the same crop till after an interval of 10 or 12 years at least.

Hemp is cultivated to some extent in the richest soils, which contain a considerable proportion of sand, and are too light for beans. The land is prepared by ploughing it three times; first, before winter, when it is richly dunged; and next in spring, when it is well harrowed. The direction of this second ploughing is across the former furrows, whenever it can conveniently be done. The third ploughing is in May, when the ground is laid as level and smooth as possible by means of the heavy hoe or hack. Two bushels of seed are then sown evenly over it, and slightly harrowed in. A slight rolling of the ground, if it is very loose, finishes the operation. Hemp completely keeps down weeds by the shade of its leaves; and the land, if very richly manured for this crop, is in good order after it for any other which may suit it. An acre of good hemp produces 800 lbs. of fibre, a middling crop is 600 lbs., and a poor one 450 lbs. The chaff of the hemp makes an excellent manure.

Flax is likewise cultivated in the sound deep loams which have been gradually enriched by manuring the preceding crops. If the dung were not thoroughly incorporated in the soil it would make the flax coarse and uneven. The soil must be pulverized to a considerable depth, and must also be very free from weeds. Two bushels of seed are sown on an acre. The best seed comes from Riga; the time of sowing is the middle of April. Clover seed is sometimes sown among it. It should be most carefully hand-weeded as soon as the plants can be distinguished from weeds: after this the flax and clover will keep them down. The produce is about six to eight bushels of seed, each of which gives a gallon and a half of oil, and from 600 to 900 lbs. of flax fit for spinning.

The grass lands and pastures occupy about three-fifths of

the surface of the county, or above 300,000 acres, of which about 6000 are irrigated, chiefly in the sandy and chalky districts. The meadows along the vale of Blackmore are extremely rich and produce much hay, which is used to feed the dairy cows in winter. The upland meadows are well managed and frequently dressed with lime and dung. Many sheep which feed on the downs in summer are wintered in the vales. The pastures on the hills are not sufficiently rich to fatten oxen, but are well adapted to feed dairy cows. The Dorset butter is in good repute in London and Portsmouth for ship provision as well as domestic use: it is not so salt as the Irish, and is therefore preferred, although the Irish is richer when it is of the best quality. Dorset salt butter, when well washed, is very commonly sold in London for fresh butter. The best cow pastures will keep a cow on two acres during the whole summer: of the inferior pastures three or four acres are required for each cow. The cows are frequently let to a dairyman at the rate of 8*l.* or 10*l.* per cow for the season. This is a great convenience to a farmer who has arable land to attend to, and is thus relieved from all care but that of providing pasture for the cows, and cows for the pasture. The cows eat little else but straw in winter, and very little hay is made in proportion to the extent of grass land. The farmer finds a house for the dairyman and his family to live in, allows him to keep as many pigs and poultry as he chooses, and a mare to carry the butter to market. This mare generally produces a foal, which is part of the dairyman's profit. The bargain is from Candlemas to Candlemas. A notice to quit given by either party before All Saints' Day is considered sufficient, and the dairyman quits the premises at Candlemas. The butter is made from the cream, and the skimmed milk is made into cheese. The milk is skimmed only once in twenty-four hours. The Dorsetshire skim-milk cheese is preferred on account of streaks of blue mould which frequently run through it. These streaks are said to be produced by breaking the curd again after the cheese has been pressed, and sprinkling wheat flour over the fragments; it is then replaced in the vat and pressed again.

A few calves are annually reared to keep up the number of the cows: the calves have milk for three months, and the dairyman receives an allowance of a fourth part of the sums which he pays for a cow for each calf so reared. February is the usual time for weaning calves, because in May when the grass is abundant they can be turned out to advantage and get strong before winter.

The cows kept for the dairy in the vales are chiefly of the Devonshire breed, but the pasture on the hills not being sufficiently good for them, another mixed breed is preferred there, which has longer horns, and seems to be a cross between the old long horns and the Gloucestershire, or perhaps the short horn. The colour is generally brindle on the sides with a white stripe down the back and white under the belly. They are hardy, and in general good milkers on moderate pasture. Crosses with Alderney cows are occasionally met with, but chiefly in gentlemen's dairies on account of the rich cream which they give. Dairywomen prefer quantity of milk and larger cows.

The Dorset sheep are noted as a profitable breed to those who rear house-lambs for the London market. They are horned and well formed, straight in the carcase, deep in the body, and the rump is larger than in other sheep; the breast points forward, the face is thin, the horns are thin and bend rather backward, the tail is usually left long. They give much milk and fatten their lambs better than any other breed. There is another very small breed in the Isle of Purbeck, and near Weymouth, of which the flesh is in repute with epicures: they weigh about 10 lbs. a quarter, and are generally sold by the quarter like early lamb, and not by the pound. Some consider them as the real and original Dorsetshire breed. They resemble the small forest sheep formerly found on all the commons of the forest of Windsor, and on Bagshot-heath, the mutton of which was in equal repute as Bagshot mutton. The wool is fine, but the fleeces do not weigh above 1½ or 2 pounds on an average. The South-down breed is very generally found in Dorsetshire, and suits the pasture and climate better than the Leicester. The management of Dorset ewes, when they are intended for producing early lambs, is as follows:—At four years old when the ewes have had two or three lambs, their lambs are weaned in April, and the ewes are kept on water meadows and the richest pastures, without being ever folded, that they may be in condition to

take the ram in May and June, and be forward in lamb by Michaelmas, when they are almost invariably sent to Weyhill fair, and sold to dealers who drive them towards London and sell them to those who fatten early house-lamb, and who make a very considerable profit on them, if they understand how to manage the ewes to the best advantage. The Dorset ewes frequently have twin lambs, but the single are preferred for fattening. When there are twins, one of them is either killed immediately or given away. The average quantity of wool on a Dorset sheep is 3½ pounds.

The following fairs are established in the county; but several of them are no longer cattle fairs, but mere holidays: Abbey Milton, Tuesday after July 25; Abbotsbury, July 10; Allington, July 22; Beaminster, September 19; Blandford, March 7, July 10, and November 8, a large sheep fair; Bridport, April 6, fat beasts, cows, calves, bulls; October 11, cattle and pedlery; Broadway, Wednesday before September 18; Broad Windsor, Trinity Monday; Cerne Abbas, Midlent Monday, for barren cows, and cows with calf, Holy Thursday, October 2; Corfe Castle, May 12, October 29 for hogs and toys; Cranbourne, August 24, December 6, cheese and sheep; Dallwood, first Wednesday before August 24; Dorchester, February 14, cows and calves, barreners, Trinity Monday, cows and horses: July 6, sheep and lambs, August 6, sheep, lamb, wool, leather; Emmergreen, Tuesday before Holy Thursday; Evershot, May 12, cattle and toys; Farnham, August 21, cheese and toys; Frampton, March 4, August 1, September 4; Gillingham, Trinity Monday, cattle, September 12, toys; Hermitage, August 26, horses; Holtwood, August 6, horses, sheep, toys; Lyme Regis, February 13, October 2; Leigh, March 25, May 1, September 3; Lambert Castle, Wednesday before June 24, cattle; Maiden Newtown, March 9, May 4, cows, &c.; Martin Town, November 22, 23, sheep, cows, and horses; Milborne St. Andrews, November 30, sheep, cows, &c.; Melbury, Whitsun Monday; Ower Moigne, October 10, pigs and toys; Poole, May 1, November 2, free mart for toys; Pamphill, July 7, October 29; Piddle Town, Easter Tuesday, October 29, cows and pigs; Portland, November 5, sheep; Shaftesbury, Saturday before Palm Sunday, June 24, November 23, cattle; Sherborne, Wednesday before Holy Thursday, cattle, July 18, wool, cattle, horses, July 26, lambs, October 13, wool and cattle; Shroton, September 25, sheep, cows, horses; Stalbridge, May 6, September 4, beasts; Stockland, July 18, cattle; Sturminster, May 12, October 24, fat cattle; Sydling, December 6, cattle; Toller Down, May 29, sheep, 30, toys; Wareham, April 17, cattle, July 5, September 11; Wimborne, Friday before Good Friday, cattle and horses, September 14, cattle, horses, sheep, cheese; Woodbury Hill, near Bere Regis, September 18, and five following days, cattle, horses, hops, cheese, cloth, &c.; Woodland, July 5, horses and cheese; Woolbridge, May 14, cows, pigs, toys; Yetminster, First Tuesday after April 20, October 4.

Divisions, Towns, &c.—The county of Dorset previous to the year 1740, was thus divided. There were five more considerable parts, or as they were termed, 'divisions,' which took their names from the towns of—I. Blandford, II. Bridport, III. Dorchester, IV. Shaftesbury, and V. Sherbourne. These were further subdivided as follows:—

I. The Blandford division contained the boroughs of (1) Blandford, (2) Corfe Castle, (3) Poole, and (4) Wareham: the hundreds of (1) Bere Regis, (2) Coombsditch, (3) Hasler, (4) Hundreds Barrow, (5) Pimperne, (6) Rowbarrow, (7) Rushmore, and (8) Winfrith: and the liberties of (1) Bindon, (2) Divilish, (3) Overmoyne, and (4) Stowborough.

II. The Bridport division contained the boroughs of (5) Bridport, and (6) Lyme Regis; the hundreds of (9) Beaminster, (10) Beaminster Forum, and Redhove, (11) Eggar-ton, (12) Godderthorn, and (13) Whitchurch Canoniorum: and the liberties of (5) Broad Windsor, (6) Frampton, (7) Loder and Bothenhamptou, and (8) Poorstock.

III. The Dorchester division contained the boroughs of (7) Dorchester, (8) Weymouth, and (9) Melcomb Regis: the hundreds of (14) Cullifordtree, (15) George (St.), (16) Piddletown, (17) Tollerford, and (18) Uggescombe, or Uggescombe: and the liberties of (9) Fordington, (10) Piddlehinton, (11) Portland, (12) Preston and Sutton Poyntz, (13) Waybause, and (14) Wyke Regis and Elwell.

IV. The Shaftesbury division contained the borough of (10) Shaftesbury: the hundreds of (19) Badbury, (20) Cogdean, (21) Cranbourne, (22) Knolton, (23) Loosebarrow, (24) Sixpenny Handley, (25) Up Winbourne Monkton, and (26)

Wimbourne St. Giles: and the liberties of (15) Alcester, (16) Gillingham, and (17) Sturminster Marshall.

V. The Sherbourne division contained the hundreds of (27) Brownshal, (28) Buckland Newton, (29) Cerne, (30) Modbury, (31) Redlane, (32) Sherbourne, (33) Sturminster Newton Castle, (34) Totcomb, (35) Whiteway, and (36) Yateminster: and the liberties of (18) Alton Pancras, (19) Halstock, (20) Minterne Magna, (21) Piddletrenthide, (22) Ryne Intrinseca, (23) Sydling St. Nicholas, and (24) Stour Provost, Cerne, Totcomb, and Modbury hundreds are for some purposes united: and the liberty of Minterne Magna is by some given as united with that of Piddletrenthide.

The boroughs in the above list are not all parliamentary.

Since 1740 a new arrangement of the county has been adopted. The five divisions have been increased to nine, as follows:—

I. The Blandford north division (population 9198) contains the borough of (1) Blandford; the hundreds of (1) Coombsditch, (2) Pimperne, (3) Rushmore; and the liberty of (1) Divelish, or Dewlish.

II. The Blandford south division (population 15,139) contains the boroughs of (2) Corfe Castle, and (3) Wareham; the hundreds of (4) Beer, or Bere Regis, (5) Hundredsbarrow, (6) Hasilor or Hasler, (7) Rowbarrow, (8) Winfrith; and the liberties of (2) Bindon, (3) Overmoigne or Overmoygne, and (4) Stoborough, or Stowborough.

III. The Bridport division (population 29,585) contains the boroughs of (4) Bridport, and (5) Lyme Regis: the hundreds of (9) Beamminster, (10) Beamminster Forum and Redhouse or Redhove, (11) Eggerton or Eggardon, (12) Goddethorn, and (13) Whitechurch Canonicorum; and the liberties of (5) Broad Windsor, (6) Frampton, (7) Loder, or Lothers, and Bothenhampton, and (8) Poorstock.

IV. The Cerne division (population 8517) contains the hundreds of (14) Buckland Newton, (15) Cerne, (16) Modbury, (17) Totcomb (which three are united), and (18) Whiteway; the liberties of (9) Alton Pancras, (10) Piddletrenthide, and (11) Sydling St. Nicholas.

V. The Dorchester division (population 32,039) contains the boroughs of (6) Dorchester, (7) Melcomb Regis, united with (8) Weymouth; the hundreds of (19) Cullifordtree, (20) George, or St. George, (21) Tollerford, (22) Piddletown, (23) Uggscombe; and the liberties of (12) Fordington, or Forthington, (13) Piddlehinton, (14) Portland, (15) Sutton Points, or Poyntz, (16) Wabyhouse, or Waybaouse, and (17) Wyke Regis and Elwell.

VI. The Shaftesbury, or Shaston, east division (population 21,012) contains the hundreds of (24) Badbury, (25) Cogdean, (26) Cranbourne (part of), (27) Knolton, or Knowlton, (28) Loosebarrow, (29) Monkton up Wimbourne, (30) Sixpenny Handley (part of), and (31) Wimbourne St. Giles.

VII. The Shaftesbury, or Shaston, west division (population 12,510) contains the borough of (9) Shaftesbury; parts of the hundreds of (26) Cranbourne, and (30) Sixpenny Handley, given above; and the liberties of (18) Alcester, and (19) Gillingham.

VIII. The Sherbourne, or Sherborne, division (population 10,953) contains the hundreds of (32) Sherbourne, and (33) Yateminster, or Yetminster; and the liberties of (20) Halstock, and (21) Ryne Intrinseca.

IX. The Sturminster division (population 11,219) contains the hundreds of (34) Brownshal, (35) Redlane, and (36) Sturminster Newton Castle; and the liberty of (22) Stour or Stower Provost.

The hundreds in the above list, it will be seen, are the same as those in the foregoing: but the borough of Poole is here omitted, being considered as a county of itself (population 6459), and the liberties of Minterne Magna and Sturminster Marshall are respectively included in the liberty of Piddletrenthide and the hundred of Cogdean.

The population given above is from the census of 1831.

The following are market-towns. Dorchester, the county town and a municipal and parliamentary borough, on the river Frome; population, in 1831, 3033; the parliamentary boroughs of Bridport on the Brit, population in 1831, 4242; Lyme Regis on the Sea, population in 1831, 2621; Melcomb Regis on the Sea, population in 1831, united with that of Weymouth, 7655; Poole, on Poole harbour, population in 1831, 6459; Shaftesbury, on the border of the county adjacent to Wiltshire, population in 1831, 3061; and Wareham, between the Piddle and the Frome, population in 1831, 2325; and the municipal borough of Blandford

Forum, on the Stour, population in 1831, 3109. Of these places, and of the market-towns of Beamminster on the Brit, near its source, population in 1831, 2968, Sherbourne on the Yeo, population in 1831, 4261, and Wimbourne Minster, on the Allen, population in 1831, 4009, an account is given elsewhere. [BEAMINSTER, BLANDFORD, BRIDPORT, DORCHESTER, LYME, POOLE, SHAFTESBURY, SHERBOURNE, WAREHAM, WEYMOUTH, WIMBOURNE MINSTER.]

Of the other market-towns, Cerne Abbas, Cranbourne, Stalbridge, and Sturminster Newton, as well as of Corfe Castle, a disfranchised borough, and Milton Abbas, the market of which has been discontinued of late years, an account is subjoined.

Cerne Abbas is on the little river Cerne, a feeder of the Frome, and in the combined hundreds of Cerne, Totcomb, and Modbury, $7\frac{1}{2}$ miles from Dorchester. The parish comprehends 3010 acres (a large proportion being downs or sheep-walks), and had in 1831 a population of 1209. Cerne is in a pleasant vale, surrounded by steep chalk hills. It is a very small town, with little trade except what is transacted at its weekly market (held on Wednesday, for corn, butchers' meat, and provisions, and tolerably well frequented), and at its three yearly fairs. The town was formerly notorious for the number of persons engaged in smuggling. Petty sessions for the division are held here. There was formerly at Cerne a Benedictine abbey of great antiquity, rebuilt and endowed in the tenth century by Ailmer, or Ælward, or Ægilward, whom Leland calls earl of Cornwall and Devon. Its revenues were valued, at the dissolution, at 62*l.* 13*s.* 2*d.* gross, or 51*l.* 17*s.* 10*d.* clear yearly value. All that remains of the abbey is a stately, large, square, embattled tower or gate-house, now much dilapidated. There is an ancient bridge, once an appendage of the abbey, and a more modern bridge; both are of stone. A mansion-house, called the Abbey House, and chiefly built from the ruins of the abbey, contains incorporated in it some remains of the more antient abbey-house, built by Abbot Vanne in the fifteenth century. Several beautiful overflowing wells still remain, probably the work of the abbots, drawing their sources through subterranean channels from the spring of St. Augustine. The parish church was built by one of the later abbots for the use of the parishioners. It is a handsome building, in the perpendicular style of Gothic architecture, with a fine tower, which has octagonal turrets and pinnacles. The living is a vicarage, of the annual value of 81*l.*, with a glebe-house. There is a meeting-house for Independents. By the education returns of 1833, it appears that there were in Cerne 1 infant and daily school, with about 80 children, partly supported by the clergyman of the parish; 9 day-schools, with nearly 220 children; and 2 Sunday-schools, with nearly 150 children (the larger school connected with the church), supported by voluntary contributions.

On the southern slope of 'Trendle Hill,' a short distance north-west of the town, is the outline of a remarkable figure of a man bearing a club, cut into the chalk; the height of the figure is about 180 ft.; the outlines are about 2 ft. broad. There are various traditional and conjectural statements respecting the origin of this figure. It is repaired by the townspeople about once in seven years. On the south point of the hill, over the giant's head, has been an antient fortification, and on the north point a barrow. There are several barrows on the surrounding hills. Cerne was injured by the Irish troops in the king's service in the great civil war A.D. 1644, and by a storm of wind A.D. 1731.

Cranbourne is a small market-town, situated in a fine champaign country, on the little river Allen (a feeder of the Stour) near its head. It is in the hundred of Cranbourne, 93 miles from London. The parish is the largest in the county, comprehending 13,730 acres, and had, in 1831, a population of 2158, chiefly agricultural. No manufactures are carried on. The market, which is small, is on Thursdays; there are two fairs and one great cattle market in the year. The houses are in general neat and well built. About A.D. 980 a monastery for Benedictines was founded here by Ailward de Meau or Snew, of the family of Edward the Elder. This either was originally, or subsequently became, an abbey; but the abbot and most of the monks being removed to Tewkesbury, it was reduced to be a simple priory and a cell of Tewkesbury. Some time after the Dissolution, the present manor-house was built on the site and from the materials of the priory; it is the property of the Marquis of Salisbury, who takes the title of viscount from

this town. The parish church, formerly the priory church, which is one of the oldest and largest in the county, will accommodate 1000 persons. The tower is in the perpendicular style: the church has portions of an earlier character, and a door under the north porch is Norman. There is a rich wood pulpit on a stone base. The living is a vicarage, united with the chapelries of Verwood and Boveridge, of the yearly value of 151*l.*, with a glebe-house. There were in the parish, in 1833, 6 infant or dame schools, with 60 children; 4 day-schools, with 206 children; and 4 Sunday-schools, with 402 children.

North-west of the town is a large waste extending into Wiltshire: it was formerly a free warren or chase, once possessed by the house of Gloucester, and till lately by Lord Rivers, who had a right to keep deer all over it. It is covered chiefly with hazels and blackthorns, with a few timber trees. It has lately been disfranchised as a chase by act of parliament. It was very pernicious to the neighbouring farms, and was the occasion that few turnips were sown, as the deer made great depredations on that crop and could not be prevented. The deer are now destroyed.

Stalbridge is in the hundred of Brownshil, about two miles from the Cale (which falls into the Stour), 112 miles from London. The parish contains 4900 acres (including the tithings of Gomershay, Thornhill and Weston), and had in 1831 a population of 1773, of which rather more than a third was agricultural. The market is on Tuesday, and there are two cattle fairs in the year. The cattle market is held in alternate weeks. According to Hutchins's *History of Dorsetshire* (2nd edit. 1813, vol. iii., p. 239), the stocking manufacture is carried on here.

The town is irregularly laid out: in the market-place is an ancient cross twenty-two feet high, or, including the base of three steps, thirty feet. There is a dissenting meeting-house. The church is a large antient structure, with a high embattled tower at the west end. The living is a rectory of the yearly value of 888*l.* with a glebe-house. There were in the parish in 1833, one 'national' day-school, supported by subscription, with 115 children, three Sunday-schools, with 308 children, besides several dame schools. Stone is quarried in the parish, and used for building and roofing.

Sturminster or Stourminster Newton Castle is in the hundred of the same name, in a rich vale on the bank of the Stour, 109 miles from London. The town is divided into two parts: Sturminster (by far the largest) lies on the north side, Newton Castle lies on the south side of the river. The two are connected by a bridge. The parish contains 4530 acres, and had in 1831 a population of 1831, of which about two-fifths are agricultural. The market is on Thursday for corn and on Saturday for butchers' meat: the cattle market is once a fortnight: there are two fairs in the year for cattle, &c.

The town is irregularly built; the market-house is a very antient building, near which is the base of a cross, on four steps. The church is a large building with an embattled tower of moderate height. The living is a vicarage of the yearly value of 712*l.* In Newton Castle is an antient fortification, probably of the Saxon time, in the form of a Roman D, surrounded on the south-west side and part of the east side by a vallum and ditch: there are the remains of some antient buildings near it. There were in the parish in 1833, one infant school with nearly 170 children, one day-school with 60 or 70 boys, and one Sunday-school of 140 children, all supported by subscriptions or donations: and five other day-schools with about 50 children.

Corfe Castle, a disfranchised borough, is near the centre of the 'i-le' or rather peninsula of Purbeck. It is included in Blandford south division, and is 116 miles from London. The borough and parish boundaries are the same, and include an area of 9860 acres: there were in 1831 1712 inhabitants.

This town, which is near the castle, consists of two streets, of mean looking houses, built of stone and covered with tiles. The inhabitants are partly engaged in the marble and stone quarries, and clay works in the neighbourhood. The church is a large and very antient fabric, with many portions of Norman and early English architecture: it has an embattled and pinnacled tower, a large porch, and two buildings, one on each side of the church, formerly chapels, but now applied to other purposes. The church was much damaged in the great civil war when the castle was attacked A. D. 1646.

The castle was built, probably in the tenth century, by

King Edgar. Its stateliness and strength, being situated on a high hill, caused it to be regarded in former times as a fortress of great importance. It was sometimes the residence of the West Saxon princes. Here King Edward the Martyr was assassinated by his step-mother, Elfrida (A. D. 978 or 981). King John in his war with the barons deposited his regalia here for security: and Edward II. when he fell into the hands of his enemies was for a time imprisoned here. In the great civil war Corfe Castle was stoutly defended for the king by Lady Bankes, wife of Lord Chief Justice Sir John Bankes, the owner of it, with the assistance of her friends and retainers, and of a governor sent from the king's army. It was however taken by the parliamentarians by treachery, February, 1645-46, and dismantled.

The ruins are extensive, and from their high situation form a very striking object. The castle is separated from the town by a ditch, now dry, which is crossed by a bridge of four very narrow high arches. 'The vast fragments of the king's tower,' says Mr. Hutchins, 'the round towers, leaning as if ready to fall, the broken walls and vast pieces of them tumbled into the vale below, form such a scene of havoc and desolation as strikes every spectator with horror and concern. The plenty of stone in the neighbourhood, and the excellency of the cement, harder to be broken than the stones themselves, have preserved these prodigious ruins from being embezzled and lessened.'

Corfe Castle was a borough by prescription previous to the reign of Elizabeth, who bestowed on it a charter; but the privileges granted by this charter were vested rather in the lord of the manor than the burgesses. Another charter was granted by Charles II. Corfe Castle never sent representatives to the House of Commons till the reign of Queen Elizabeth, and was disfranchised by the Reform Act. The parish is now included in the parliamentary borough of Wareham.

The living of Corfe Castle is a rectory, of the yearly value of 685*l.*, with a glebe-house. There were in the parish in 1833, three infant or dame schools with 65 children; five day-schools with above 250 children; four of these schools were chiefly supported by subscriptions and donations; and three Sunday-schools with above 200 children. One of the day-schools (supported by dissenters) had a lending library attached.

Milton Abbas, or Abbot, is said to derive its name (which is a contraction of Middleton Abbot) from its situation near the centre of the county. It is in the hundred of White-way, in a deep vale inclosed by steep chalk hills on the north and south side, 111 miles from London. The parish comprehends 2420 acres, and had in 1831 a population of 846 persons: above three-fourths of the population are agricultural. Its market and fairs have been given up.

Here was an abbey founded by King Athelstan, which alone gave any importance to the town, which was in former times more considerable than now. The abbey has been numbered among the mitred abbeys, but erroneously. Its value at the dissolution was 720*l.* 4*s.* 1*d.* gross, or 578*l.* 13*s.* 11*d.* clear. The buildings of the abbey were preserved for a long time, but were gradually pulled down, chiefly to be replaced by more modern erections. The hall yet remains, a noble and magnificent old room: part of the mansion of Milton Abbey, belonging to the Damer family, which enjoyed for some time the title of earl of Dorchester, now extinct. Milton has an almshouse and a grammar-school. The conventual church was for some time the parish church, but a late earl of Dorchester having built a new parish church, converted the old one into a private chapel. It consists of the choir, transepts, and tower of the old abbey church: the choir is chiefly of early decorated character, the transepts and tower perpendicular. The general appearance of this edifice is very fine.

The living of Milton Abbas is a vicarage, of the yearly value of 127*l.*, with a glebe-house. In 1833 the parish contained seven day-schools with about 70 children, and two Sunday-schools with about 50.

Markets were formerly kept at Abbotsbury, Bere Regis, Evershot, Frampton, and other places. The inhabitants of Abbotsbury, which is near the western end of the Chesil Bank, are much engaged in the mackerel fishery. A large abbey of Benedictines was founded here in the eleventh century by Orc, steward of King Edward the Confessor. Very little of the monastic buildings now remain: the conventual church is, except the porch, entirely demolished.

Near Abbotsbury is an antient chapel of St. Catherine, which, from its elevated situation, is used as a sea-mark. Swannage, or Swanwich, near Corfe Castle, is a place of some resort as a bathing place.

Divisions for Ecclesiastical and Legal purposes.—In the earlier period of the Ecclesiastical constitution of England, Dorsetshire was included in the bishopric of Dorchester in Oxfordshire, a see founded by Birinus, first bishop of the West Saxons, about A.D. 626; and afterwards removed to Winchester. In the year 705 when Ina, king of Wessex, divided his kingdom into dioceses, Dorsetshire was comprehended in that of Sherborne, from which place the see was removed, about the middle of the 11th century, to Sarum. Upon the erection of the see of Bristol, A.D. 1542, Dorsetshire was transferred to the new diocese, of which it constituted the chief part, and it continued to be so, until transferred back by the late act to the diocese of Salisbury. Dorsetshire was an archdeaconry before it was transferred to the see of Bristol. It is subdivided into five rural deaneries, Bridport, Dorchester, Pimperne, Shaftesbury, and Whitchurch Winterbourne. While the county was in the diocese of Bristol the bishop held his triennial, and the archdeacon his annual visitations at Bridport, Dorchester, Blandford, Shaftesbury, Cerne Abbas, or Whitchurch: this arrangement we presume will be continued. The number of benefices it is difficult to give: Hutchins gives the parishes at 250; of these some are parochial chapelries; others, though separate and independent in other respects, are united under one incumbent.

This county is included in the Western circuit. The assizes were antiently held at Sherbourne; sometimes though rarely at Shaftesbury, but generally, especially in latter times, at Dorchester, where they may be considered as now fixed. The shire-hall and county gaol are at Dorchester. The Epiphany quarter sessions are held at Blandford, the Easter at Sherbourne, the Midsummer at Shaftesbury, and the Michaelmas at Bridport.

Before the passing of the Reform Act, twenty members were returned to the House of Commons from Dorsetshire, viz. two for the county, four for the united boroughs of Weymouth and Melcomb Regis, and two each for the boroughs of Bridport, Corfe Castle, Dorchester, Lyme, Poole, Shaftesbury, and Wareham. By the Reform Act the number has been reduced to fourteen, viz., three for the county, two each for the boroughs of Bridport, Dorchester, and Poole, and Weymouth, united with Melcomb Regis; and one each for the boroughs of Shaftesbury, Lyme Regis, and Wareham. Corfe Castle was disfranchised and included in the neighbouring parliamentary borough of Wareham. The chief place of election for the county is Dorchester: the polling stations are Beaminster, Blandford, Chesilton (in the Isle of Portland), Dorchester, Shaftesbury, Sherbourne, Wareham, and Wimbourne.

History and Antiquities.—This county was, in the earliest period noticed by history, inhabited by a people whom Ptolemy calls *Δουροτριγες*; Durotriges, a name which Mr. Hutchins (after Camden) derives from the British words *Dwr* water and *Trig* an inhabitant, and interprets to mean dwellers by the water side. According to Asser Menevensis the Britons called this people *Dwr Gwyr*: the Saxons called them *Dorsettan* (Dorsettan,) whence the modern name of the county. The name Dorsettan is equivalent in meaning to the antient British name, given in a Greek form by Ptolemy. These Durotriges appear to have been of Belgic race. Upon the conquest of South Britain by the Romans, Dorsetshire was included in *Britannia Prima*.

Of this early period of our history there are several remains in various camps and earth works, stone circles, cromlechs, and barrows. In the north-eastern part of the county and the adjacent part of Wiltshire, are several embankments with ditches: they all run in a winding and irregular manner, mostly from south-east to north-west, having the ditch on the north-east side. Vernditch, which has given name to a part of Cranbourne chace, is of these. Grimsditch is another. On the right of the road from Cerne Abbas to Calstock and in other parts of the county are little banks, crossing one another in all kinds of angles: they are made of flints covered with turf. Neither their age nor their use seems to be known.

There are several Roman camps in the county. Mr. Hutchins enumerates twenty-five; and the walls and amphitheatre of Dorchester, and the coins and pavements found there, are monuments of the same victorious people.

There were at least two Roman stations in the county, viz., Durnovaria, [Itin. Antonini,] or *Δουρνιον*, Dunium [Ptolemy], Dorchester; and Vindocladia or Vindogladia, Vindelia in Richard of Cirencester, which some are disposed to fix at Wimbourne, others more probably at Gussage, between Blandford Forum and Cranbourne. To these Dr. Stukely would add a third, Ibernium, (mentioned by the anonymous Ravennas,) which he fixes at Bere Regis. Several places in the confused and barbarous list of names given by Ravennas, are conjectured by Baxter to be in Dorsetshire.

The Icknield or Ecknield way enters the county at its western extremity, coming from Hembury Fort [DEVONSHIRE], and runs east by south to Dorchester, near which it is very perfect, high and broad, and paved with flint and stone: from Dorchester it runs by Sheepwick and Sturminster Marshall, and the Gussages into Wiltshire. In this part it is called Ackling dike. Its passing near the Gussages gives support to the conjecture of those who fix Vindogladia at one of them. The remains of a Roman road may be traced on the south-west side of the Frome, leading from Dorchester in a north-west direction as far as Bradford Peverel, and Stratton, soon after which it disappears: another road may be traced from Dorchester, on the other bank of Frome, parallel to the former road, and uniting with it at Stratton; a third runs south from Dorchester in the direction of Melcomb Regis; and there are traces of several others.

When the Saxons established their octarchy, Dorsetshire was included in the kingdom of Wessex; and even after the West Saxon princes acquired the sovereignty of England, they resided occasionally in this county. Ethelbald and Ethelbert, the elder brothers of Alfred the Great, were buried at Sherbourne; and Ethelred I., another brother of the same prince, at Wimbourne.

In the invasions of the Danes this county suffered severely. Egbert, king of Wessex, fought a battle with them at Charmouth, near the western extremity of Dorsetshire, A.D. 833. Seven years afterwards his son Ethelwolf fought a second battle with them at the same place. In A.D. 876 they made themselves masters of Wareham, where they were besieged by Alfred, who obliged them to quit that place the next year, when 120 of their vessels were wrecked at Swanage. In A.D. 1002, Sweyn, king of Denmark, in his invasion of England, destroyed Dorchester, Sherbourne, and Shaston or Shaftesbury.

Throughout the middle ages, few events of historical interest connected with the county occur. The contest of the Roses little affected this part of the kingdom. The towns on the coast were flourishing, as appears from the following list of the vessels which they furnished to the fleet of Edward III. at the siege of Calais, A.D. 1347: Weymouth, 20 ships and 264 mariners, or, according to Hackluyt, 15 ships and 263 mariners; Lyme, 4 ships, 62 mariners; Poole, 4 ships, 94 mariners; Wareham, 3 ships, 59 mariners. To judge of the comparative importance of these armaments, it must be remembered that Bristol furnished only 22 ships and 608 mariners, and London 23 ships and 662 mariners; so that Weymouth furnished only 2 vessels less than Bristol, and only 5 less than London; they were, however, more weakly manned and probably smaller. To the fleet of the lord high admiral (Howard of Effingham) at the time of the armada, A.D. 1588, this county furnished 8 vessels (3 of them volunteers); the aggregate tonnage of 7 of these was 560 tons, and they carried 290 men; the tonnage of the eighth vessel is unknown; it carried 50 soldiers. The second engagement of the English fleet with the armada was off Portland Bill.

In the civil war of Charles I. the gentry were mostly for the king; but the people of the towns, where the clothing trade was then carried on, and of the ports, were for the parliament. In the beginning of the war, Sir Walter Earle and Sir Thomas Trenchard, partisans of the parliament, possessed themselves of Dorchester, Weymouth, Portland, Lyme, Wareham, and Poole, while Sherbourne Castle, Chideock Castle, and Corfe Castle were garrisoned by the king. The parliamentarians always retained Lyme and Poole, which were fortified; but the other towns, being open, fell into the hands of whichever party was master of the field. In March, 1642-3, Sir William Waller marched into the county with two regiments of horse, but did little; and the earl of Carnarvon entering the county with a body of royalists, took Dorchester and Portland, and raised the

siege of Corfe Castle which the parliamentarians had formed. Several engagements took place in the county at a later period of the contest, but they were of little moment. Corfe Castle held out for the king till 1645-6. The year 1645 was distinguished by the rising of the club men in the counties of Dorset, Wilts, and Somerset; their object was to defend this part of the country from the outrages of both parties. Their assembling excited the jealousy of the parliamentarians, whose superiority was now established. Cromwell defeated a considerable body of them at Hamilton hill, and other bodies were persuaded to disperse.

STATISTICS.

Population.—Dorsetshire is principally an agricultural

county, ranking the seventeenth in this respect. Of 37,861 males twenty years of age and upwards, inhabitants of Dorsetshire in 1831, there were 16,766 engaged in agricultural pursuits, and only 722 in manufactures or in making manufacturing machinery. Of these latter 400 were employed in the manufacture of hemp into twine and sailcloth, chiefly at Bridport; 80 were employed in the woollen manufactures, chiefly at Lyme Regis; about 40 in silk, mostly at Shaftesbury; there were a few glove-makers at Cerne-Abbas; and wire button-making still gives employment to a few hands.

The following summary of the population, as taken in 1831, shows the number of the inhabitants and their occupations in each division of the county.

| DIVISIONS, &c. | HOUSES. | | | | OCCUPATIONS. | | | PERSONS. | | | |
|--|------------|-----------|-----------|--------------|---|---|--|----------|----------|---------|----------------------------|
| | Inhabited. | Families. | Building. | Uninhabited. | Families chiefly employed in agriculture. | Families chiefly employed in trade, manufactures, and handicraft. | All other families not comprised in the two preceding classes. | Males. | Females. | Total. | Males twenty years of age. |
| Blandford, North . . . | 1,095 | 1,318 | 9 | 25 | 891 | 258 | 169 | 2,993 | 3,096 | 16,089 | 1,541 |
| Blandford, South . . . | 2,415 | 2,697 | 19 | 65 | 1,371 | 476 | 850 | 6,251 | 6,563 | 12,814 | 3,032 |
| Bridport . . . | 4,753 | 5,178 | 44 | 176 | 2,663 | 1,528 | 987 | 12,280 | 13,063 | 25,343 | 5,948 |
| Cerne . . . | 1,509 | 1,844 | 14 | 56 | 1,179 | 386 | 279 | 4,186 | 4,331 | 8,517 | 2,143 |

| Lyme Regis, borough . . . | 423 | 542 | 7 | 56 | 33 | 257 | 252 | 1,161 | 1,460 | 2,621 | 596 |
| Shaftesbury or } borough Shaston, . . . | 516 | 560 | 11 | 30 | 72 | 361 | 127 | 1,484 | 1,577 | 3,061 | 711 |
| Sherborne, town . . . | 762 | 985 | 7 | 15 | 180 | 559 | 246 | 1,809 | 2,266 | 4,075 | 945 |
| Wareham, borough . . . | 494 | 517 | 8 | 23 | 72 | 182 | 263 | 1,066 | 1,259 | 2,325 | 499 |
| Weymouth and } borough Melcombe Regis . . . | 1,320 | 1,769 | 10 | 135 | 19 | 847 | 903 | 3,323 | 4,332 | 7,655 | 1,694 |
| Poole, town and county . . . | 1,315 | 1,426 | 11 | 76 | 6 | 645 | 775 | 2,884 | 3,575 | 6,459 | 1,264 |
| Totals . . . | 29,307 | 33,614 | 310 | 1,200 | 14,601 | 10,106 | 8,907 | 76,536 | 82,716 | 159,252 | 37,861 |

The population of Dorsetshire each time the census was taken was:—

| | Males. | Females. | Total. | Incr. per cent. |
|------|--------|----------|---------|-----------------|
| 1801 | 53,667 | 61,652 | 115,319 | |
| 1811 | 57,717 | 66,976 | 124,693 | 8.13 |
| 1821 | 68,934 | 75,565 | 144,499 | 15.88 |
| 1831 | 76,536 | 82,716 | 159,252 | 10.22 |

Showing an increase between the first and last periods of 44,933, nearly 39 per cent., which is 17 per cent. below the general rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the four dates of

| | £. | s. | d. |
|-----------|---------|-----------|---------------------------|
| 1801 were | 64,771 | which was | 11 2 for each inhabitant. |
| 1811 " | 109,304 | " | 17 6 " |
| 1821 " | 85,647 | " | 11 10 " |
| 1831 " | 90,668 | " | 11 4 " |

The sum expended for the same purpose in the year ending March 25, 1836, was 68,019*l.*; and assuming the same rate of increase in the population since 1831 as in the ten years preceding that period, the above sum gives an average of about 8*s.* 1*d.* for each inhabitant. These averages are beyond those for the whole of England and Wales.

The sum raised in Dorsetshire for poor-rate, county-rate, and other local purposes, in the year ending the 25th of March, 1833, was 108,495*l.* 14*s.*, and was levied upon the various descriptions of property as follows:—

| | £. | s. |
|---------------------------------------|--------|----|
| On land . . . | 85,991 | 0 |
| Dwelling-houses . . . | 18,961 | 10 |
| Mills, factories, &c. . . | 1,520 | 10 |
| Manorial profits, navigation, &c. . . | 2,023 | 14 |

The amount expended was:—

| | £. | s. |
|--|---------|----|
| For the relief of the poor . . . | 90,488 | 16 |
| In suits of law, removal of paupers, &c. . . | 2,417 | 2 |
| For other purposes . . . | 14,301 | 10 |
| | 107,207 | 8 |

In the returns made up for the subsequent years, the descriptions of property assessed for local purposes are not distinguished. The sums raised in the years 1834, 1835 and 1836 were 102,615*l.* 11*s.*, 94,915*l.* 15*s.*, and 82,148*l.* 12*s.* respectively, and the expenditure was as follows:—

| | 1834. | 1835. | 1836. |
|---------------------------------------|------------|-----------|-----------|
| For the relief of the poor . . . | £84,393 0 | £76,091 3 | £68,019 7 |
| In suits of law, removals, &c. . . | 2,634 15 | 2,065 4 | 1,797 16 |
| Payment towards the county-rate . . . | 11,914 19 | 9,053 4 | 6,828 19 |
| For all other purposes . . . | | 6,999 2 | 6,330 5 |
| Total money expended . . . | £98,941 14 | 94,213 13 | 83,276 7 |

The saving effected in the sums expended for the relief of the poor in 1836, as compared with the expenditure of 1834, was therefore 16,727*l.* 13*s.*, or rather more than 19 per cent., and the saving in the whole sum expended was 15,666*l.* 7*s.*, or nearly 15½ per cent.

The county expenditure in 1834, exclusive of the relief for the poor, was 14,733*l.* 14*s.* 11*d.*, disbursed as follows:—

| | £. | s. | d. |
|--|-------|----|----|
| Bridges, buildings, and repairs, &c. . . | 746 | 7 | 11 |
| Gaols, houses of correction, &c., and maintaining prisoners, &c. . . | 2,274 | 19 | 6½ |
| Shire halls and courts of justice—building, repairing, &c. . . | 65 | 15 | 1 |
| Lunatic asylums . . . | 2,251 | 7 | 9 |
| Prosecutions . . . | 1,096 | 16 | 7½ |
| Clerk of the peace . . . | 565 | 1 | 0 |

| | £. | s. | d. |
|--|-----|----|----|
| Conveyance of prisoners before trial . . . | 819 | 15 | 5 |
| " of transports . . . | 210 | 16 | 6 |
| Vagrants—apprehending and conveying . . . | 147 | 10 | 0 |
| Constables—high and special . . . | 16 | 8 | 10 |
| Coroner . . . | 459 | 18 | 11 |
| Miscellaneous . . . | 860 | 4 | 9 |

The number of persons charged with criminal offences, in the three septennial periods ending with 1820, 1827, and 1834, were 632, 866, and 1150 respectively; making an average of 90 annually in the first period, of 124 in the second period, and of 164 in the third period. The number of persons tried at quarter-sessions, in respect to which any costs were paid out of the county-rates, were 123, 135, and 109 respectively. Of this number, there were—

| | 1831. | 1832. | 1833. |
|------------------------------|-------|-------|-------|
| Committed for felonies . . . | 82 | 83 | 65 |
| " misdemeanors . . . | 41 | 52 | 44 |

The total number of committals in each of the same years was 123, 135, and 109 respectively: of whom

| | 1831. | 1832. | 1833. |
|----------------------------------|-------|-------|-------|
| The number convicted was . . . | 87 | 79 | 79 |
| " acquitted . . . | 17 | 22 | 10 |
| Discharged by proclamation . . . | 19 | 34 | 20 |

At the assizes and sessions in 1836 there were 193 persons charged with crimes in this county. Of this number 15 were charged with offences against the person, 10 of which were for common assaults; 13 with offences against property, committed with violence; 158 with offences against property, committed without violence; 1 was committed for arson; 2 for counterfeiting coin and uttering the same; 1 for poaching; 1 for prison-breaking; and 2 for riot. Of the whole number of offenders, 118 were convicted and 75 acquitted, or no bill found against them. Of the number convicted, 5 were sentenced to death, which sentence was commuted to transportation; there were also 14 other persons transported; 1 sentenced to imprisonment for 2 years; 14 for 1 year and above 6 months; and 79 for 6 months and under; 2 were fined, and 3 were discharged on sureties. Of the total number of offenders, 162 were males and 31 were females. Among the whole not one had received superior instruction; 19 could read and write well, 106 could read and write imperfectly; and 63 could neither read nor write; the degree of instruction of the remaining 12 could not be ascertained. The proportion of offenders to the population, in 1836, was 1 in 866.

The number of turnpike trusts in Dorsetshire, as ascertained in 1834, was 17; the number of miles of road under their charge was 359; the annual income arising from the tolls and parish composition was 23,002*l.* 2*s.* 4*d.*, and the annual expenditure, 24,281*l.* 9*s.* 10*d.*

The number of persons qualified to vote for the county members of Dorsetshire was (in 1836) 6320, being 1 in 28 of the whole population, and 1 in 6 of the male population above twenty years of age. The expenses of the last election of county members to parliament were to the inhabitants of the county 233*l.* 13*s.* 11*d.*, and were paid out of the general county-rate.

There are nine savings-banks in this county. The number of depositors and amount of deposits on the 20th of November were:—

| | 1832. | 1833. | 1834. | 1835. |
|-----------------------------------|---------|---------|---------|-------|

Education.—The following summary is taken from the parliamentary inquiry on education, made in 1835:—

| | Schols. | Scholars. | Total |
|---|---------|-----------|-------|
| Infant schools | 115 | | |
| Number of infants at such schools; ages from 2 to 7 years — | | | |
| Males | | 859 | |
| Females | | 950 | |
| Sex not specified | | 392 | |
| | | | 2,201 |

| | | | |
|---|-----|-------|--------|
| Daily schools | 596 | | |
| Number of children at such schools; ages from 4 to 14 years:— | | | |
| Males | | 6,493 | |
| Females | | 5,566 | |
| Sex not specified | | 3,898 | |
| | | | 15,957 |

| | | | |
|---|-----|--|--------|
| Schools | 711 | | |
| Total of children under daily instruction | | | 18,158 |

| | | | |
|--|-----|-------|--------|
| Sunday schools | 316 | | |
| Number of children at such schools; ages from 4 to 15 and 16 years:— | | | |
| Males | | 7,577 | |
| Females | | 8,144 | |
| Sex not specified | | 4,109 | |
| | | | 19,830 |

Assuming that the population between 2 and 15 years of age has increased in the same proportion as the whole population since 1821, and that since 1831 the rate of increase has been in the same ratio as in the ten preceding years: there were in 1834 about 50,010 children in Dorsetshire, between the ages of 2 and 15. A very large number of the scholars attend both daily and Sunday-schools, but in what number or in what proportion is uncertain. Thirty-eight Sunday-schools, attended by 1268 children, are returned from places where no other schools exist; but in all other places Sunday-school children have opportunity of resorting to other schools also. Thirty-one schools, containing 1841 scholars, are both daily and Sunday schools, and duplicate entry is known to have been thus far created. We may therefore conclude that not more than two-thirds of the whole population between the ages of 2 and 15 were receiving instruction at the time of the inquiry.

Maintenance of Schools.

| Description of Schools. | By endowment. | | By subscription. | | By payments from scholars. | | Subscrip. and payment from scholars. | |
|--------------------------|---------------|-----------|------------------|-----------|----------------------------|-----------|--------------------------------------|-----------|
| | Schls. | Scholars. | Schls. | Scholars. | Schls. | Scholars. | Schls. | Scholars. |
| Infant Schools | 3 | 36 | 5 | 241 | 101 | 1,667 | 6 | 257 |
| Daily Schools | 46 | 1297 | 66 | 3,519 | 423 | 8,983 | 61 | 2,223 |
| Sunday Schools | 10 | 703 | 296 | 18,646 | 2 | 60 | 8 | 422 |
| Total | 59 | 1966 | 367 | 22,405 | 526 | 10,710 | 75 | 2907 |

The schools established by Dissenters, included in the above statement, are:—

| | Schools. | Scholars. |
|--------------------------|----------|-----------|
| Infant schools | 3 | 72 |
| Daily " | 9 | 322 |
| Sunday " | 61 | 4,623 |

The schools established since 1818 are:—

| | | |
|--|-----|--------|
| Infant and other daily schools | 373 | 9,684 |
| Sunday-schools | 150 | 11,810 |

Twenty-nine boarding-schools are included in the number of daily schools as given above. No school in this county appears to be confined to the children of the Established Church, or of any other religious denomination, such exclusion being disclaimed in almost every instance, especially in schools established by Dissenters, with whom are here included Wesleyan Methodists, together with schools for children of Roman Catholic parents.

Lending libraries of books are attached to 31 schools in this county.

DORSIBRANCHIATA, Cuvier's appellation for the second order of Annelids, which have their organs, and especially their branchiae, distributed nearly equally along the whole of their body, or at least a part. *Chloicia* (Savigny) and *Cirratulus* (Lamarck), with many other genera, which our limits do not permit us to enumerate, belong to this order. The reader is referred to Lamarck (*Animaux sans Vertèbres*, tome v.); to Savigny (Eg. Annel.); and to Cuvier (*Règne Animal*, tome iii.) as the principal guides on this subject. [ANNELIDA.]

DORSTENIA, a genus of plants of the family of the Urticaceae. The roots of several species of this genus are

all confounded under the appellation of *Contrayerva* root, but as they all possess nearly the same chemical composition and properties, it is of little importance which particular species yields what is used. Indeed, by the time the root reaches Europe, whatever virtues it originally possessed are lost, so that it has scarcely any sensible qualities, and very little effect on the system. It consists of volatile oil, extractive and starch. The first of these gives it some power over the nervous system, should it not have been dissipated by time. Hence it is recommended in the low stages of fever, especially of children; but *serpentaria* root may at all times be advantageously substituted for it. *Contrayerva* signifies antidote, and it was at one time supposed to be an antidote to all poisons, whether animal, vegetable, or mineral, except mercury.

DORT or DORDRECHT, in ancient times called *Thuredrecht*, a city of South Holland, is situated on an island formed by the Maas, which was separated from the opposite shore in November, 1421, by an irruption of the waters. By this irruption the dikes were broken down, more than 70 villages were destroyed, and an immense number of the inhabitants were drowned. The city is situated twelve miles south-east from Rotterdam, in 51° 49' N. lat. and 4° 38' E. long.

Dort is said to have been founded by *Merovæus* in the fifth century. It is certainly one of the most ancient cities in Holland, and was formerly the capital of the province. Its situation is naturally so strong, that although frequently invested it has always made successful resistance to the besiegers. It has a safe and good harbour, and is well situated for trade, having two canals, by means of which goods can be conveyed to warehouses in the heart of the city. The principal trade is that of corn and wood; large rafts of the latter are brought down the Rhine to this place, and there broken up for sale. There are many saw-mills in the town, and ship-building also forms a large branch of its industry. Dort contains about 18,000 inhabitants. Gerard Vossius and the brothers De Witt were natives of the town. The town-hall is a handsome building, and the principal church is 300 feet long and 125 feet wide, with lofty towers and chimneys.

DORT, SYNOD OF, an Assembly of Protestant Divines convoked at Dort in the year 1618, by the States General, under the influence of Prince Maurice of Nassau, by which the tenets of the Arminians, in five points, relating to predestination and grace, were condemned by the followers of Calvinism.

At this synod ecclesiastical deputies were present from most of the States of the United Provinces, and from the churches of England, Hesse, Bremen, Switzerland, and the Palatinate. Those from England were Dr. George Carleton, bishop of Landaff; Dr. John Davenant, regius professor of divinity at Cambridge and master of Queen's College; Dr. Samuel Ward, master of Sidney College; and Dr. Joseph Hall, then dean of Worcester but afterwards bishop of Norwich. Dr. Hall's health, after two months, requiring his return, he was replaced by Dr. Thomas Goad. To these was afterwards added Walter Balcanquhal, a Scots divine, deputed by King James on behalf of the churches of that nation. The synod was opened on November 13, 1618: it consisted of thirty-eight Dutch and Walloon divines, five professors of universities, and twenty-one lay-elders; the foreign divines amounted to twenty-eight. Those from England had the precedences, after the deputies of the States.

The person by whom the Arminians were headed in defending their cause, was Simon Episcopius, at that time professor of divinity at Leyden, who opened the proceedings, on the part of his sect, with a moderation and eloquence which did him honour. The remonstrants, however, as the Arminians were called, desiring to rest the main defence of their cause, not upon the grounds in reason and scripture on which their opinions were founded, but on their refutation of the opinions of the Calvinists their adversaries, difficulties arose, and their proposal was rejected. They were told that the synod was met to judge, not to confer.

The design of the Arminians, says Mosheim, in the proposal they made, was probably to get the people on their side, by such an unfavourable representation of the Calvinistic system, and of the harsh consequences that seem deducible from it, as might excite a disgust in the minds of those who were present, against its friends and abettors. And it

is more than probable that one of the principal reasons that engaged the members of the synod to reject this proposal, was a consideration of the genius and eloquence of Episcopius, and an apprehension of the effects they might produce upon the multitude. When all the methods employed to persuade the Arminians to submit to the manner of proceeding, proposed by the synod, proved ineffectual, they were excluded from that assembly, and returned home complaining bitterly of the rigour and injustice with which they had been treated. Their cause was nevertheless tried in their absence, and, in consequence of a strict examination of their writings, they were pronounced guilty of pestilential errors, and condemned as corruptors of the true religion. This sentence was followed by its natural effects, which were the excommunication of the Arminians, the suppression of their religious assemblies, and the deprivation of their ministers.

Brandt, in the second and third volumes of his 'History of the Reformation in and about the Low Countries,' fol. London, 1720-1722, has given a very minut edetail of the proceedings in the successive sessions of this synod; they were a hundred and eighty in number, and continued till May 29th, 1619. Brandt, however, was an Arminian, and though he is to be relied upon for facts, the reasoning which he occasionally deduces from them requires a comparison with other writers. Maclaine in his 'Notes on Mosheim,' says, the reader will do well to consult the letters of the learned and worthy Mr. John Hales of Eton, who was an impartial spectator of the proceedings of this famous synod, and who relates with candour and simplicity what he saw and heard. All that appeared unfair to the Arminians in the proceedings of this synod, has been collected together in a Dutch book entitled '*Nullitegten, Mishandelingen, ende anhyllike Proceduren des Nationalen Synodi gehonden binnen Dordrecht, &c.*'

Of the disputes which had prevailed in Holland for some years, between the Calvinists and Arminians, previous to the convocation of this synod, we have already spoken in the account of Barneveldt the grand pensionary, whose fate was sealed, when it had been sanctioned by the decision of this assembly. (See Brandt, *ut sup.*; Mosheim's 'Eccles. Hist.' 4to. Lond. 1765, vol. ii. pp. 524, 525; and 'The Articles of the Synod of Dort, and its rejection of errors: transl. from the Latin, with Notes, &c. by Thomas Scott,' 8vo. Lond. 1818.)

The presentation copy of the '*Acta Synodi Nationalis, autoritate illustr. et præpotentium DD. Ordinum Generalium Fœderati Belgii Provinciarum Dordrechtii habitæ anno mdcxviii et mdcxix, fol. Lugd. Bat. 1620,*' formerly belonging to King James I., splendidly bound in crimson velvet and embroidered with the royal arms, is still preserved in the library of the British Museum. A wood-cut representing the sitting of the synod is prefixed to '*Judicium Synodi Nationalis reformatarum Ecclesiarum Belgicarum habitæ Dordrechtii, Anno 1618 et 1619.*' 'The Collegiat Suffrage of the Divines of Great Britain concerning the Five Articles controverted in the Low Countries: by them delivered in the Synod, March 6, 1619, being their vote or voice foregoing the joint and publique judgment of the Synod,' was published in English, 4to., Lond. 1629.

An Album containing the signatures of the different members of the synod was delivered to each person at the breaking up of the assembly; one of them was disposed of in London at the auction of Mr. Van Sybstein's MSS. in 1825. The gold medal struck by the States in commemoration of the synod is engraved in the '*Histoire Metalique de la Republique de Hollande, par M. Bizot,*' tom. i. p. 139.

In the sixth session, which was held on the 19th November, 1618, the synod of Dort proposed obtaining a translation of the Bible from the original texts into Dutch, which was judged to be a necessary work. In the seventh, and some of the succeeding sessions, the translation was finally agreed to, and rules laid down for the direction of the translators. In the thirteenth session, on the 26th November, the translators were appointed, when the following were chosen by a majority of votes: John Bogerman, the president of the synod; William Baudart and Gerson Bucer, for the Old Testament; Jacobus Roland, Herman Faukelius, and Peter Cornelius, for the New Testament and Apocrypha. The synod then chose sixteen supervisors of the translation; and also resolved, that in case any of the translators should die or be disabled by sickness, the president,

with the two assessors, and the scribes of the synod, should be empowered to appoint successors.

After a delay of nearly ten years, the translators of the Old Testament assembled at Leyden, in 1628, and the next year, 1629, the translators of the New Testament; but as Herman Faulkelius, pastor of the church of Middleburg, and Peter Cornelius, pastor of the church of Enchusan, had died previous to their meeting together, Anthony Walsæus and Festus Hommius were chosen in their stead. When the translation of the Old Testament had advanced as far as the first chapter of Ezekiel, Gerson Bucer died, and was succeeded in his office by Anthony Thysius; Jacobus Roland also died when the translation of the New Testament had advanced to The Acts of the Apostles. The translation of the entire Bible was completed in 1632. The supervisors of the Old Testament met at Leyden, with the translators, in 1633; and those of the New Testament in 1634; and the revision was completed in October, 1635. The printing of the Bible was finished in 1637, when it appeared in folio from the presses of Leyden and the Hague, and in octavo from the press of Amsterdam. This is what is called 'The Dort Bible.' Editions of it were soon rapidly multiplied and extensively circulated. (See Brandt, *ut supr.* vol. iii. p. 25—28; Leusdeni, *Philologus Hebræo Mixtus*, Diss. x. et xi.; and Townley's *Illustrations of Biblical Literature*, 8vo. Lond. 1821, vol. iii. pp. 400, 401.)

DOT, in music, a point, or speck, placed after a note or rest, in order to make such note or rest half as long again. Thus a semibreve with a dot is equal to three minims. a crotchet rest with a dot is equal to three quaver rests. In modern music a double dot is often used, in which case the second is equal to half of the first. Thus a double dotted minim is equal to three crotchets and a quaver; a double-dotted quaver rest is equal to three semiquaver rests and one demisemiquaver rest. Examples:—

DOTIS, one of the four circles of the county of Comorn, in north-western Hungary. Dotis (in Hungarian *Tata*), the chief town of the circle, lies to the south-east of the town of Comorn, in 47° 38' N. lat. and 18° 20' E. long. The town is situate on an eminence next the river Tata, and with its suburb, Továros, which signifies 'Lake Town,' as it lies on the margin of a narrow lake about four miles in length, contains about 960 houses and 8870 inhabitants. Between the two are the ruins of an ancient castle, celebrated for its strength in former days, and said to have been built by the Romans, which was a favourite residence of Mathias Corvinus, king of Hungary. Among the buildings of note are three churches, one of which is very old, a Capuchin and a Piarist monastery, the latter having a grammar-school, a head-district school, a military hospital, and some warm baths, much in repute. The inhabitants are industrious, have several flour and saw-mills, and manufacture coarse woollen cloths, earthenware and pottery, beer, bed-rugs, &c. In the adjoining village of Bay is a spacious cellar, capable of stowing away 50,000 aulms of wine: among them is a tun which holds 1420 aulms. The Esterházy family have a splendid castle here, with grounds laid out in the English style. At St. Ivány, near Dotis, are quarries of fine marble and freestone. There are vineyards, large sheep-grounds, and extensive forests, in the neighbourhood. Dotis, and much of the surrounding land, are the property of the Esterházy family. There are well attended annual fairs.

DOTTREL. [**POVERS**.]

DOUAY, or **DOUAI**, a town in the department of Nord, on the river Scarpe, near where the canal of the Haute Deule meets it, on the road from Paris by Peronne and Cambrai to Lille and Bruges, 121 miles from Paris. It is 108 miles from Paris in a straight line north by east, in 50° 21' N. lat., and 3° 6' E. long.

Douay is advantageously situated for commerce. It is surrounded by antient walls, flanked with towers: the walls afford an agreeable promenade. The town is further defended by a fort on the left bank of the Scarpe. The area

inclosed by the walls is large, and contains almost as many gardens as dwellings. The streets are well laid out, and the town-hall, the church of St. Pierre (Peter), and the arsenal, one of the most considerable in France, are the principal buildings. The inhabitants, who amounted in 1832 to 18,793, are engaged in manufactures of various kinds, as linens, lace, gauze, cotton goods and yarn, soap, glass, leather, and refined sugar. A considerable trade is carried on in flax, woollen cloth, and cattle. There is every second year an exhibition of the articles of manufacturing industry; and prizes are distributed for the most useful and ingenious inventions or the best finished pieces of workmanship. Medals are likewise annually distributed by the Departmental Society of Agriculture, which has its seat in this town, not at Lille. Douay is the seat of a *cour royale*, which exercises jurisdiction over the departments of Nord and Pas de Calais. It is also the capital of an *arrondissement*. There are at Douay an *académie universitaire* or university, a *collège* or high school, a school for the artillery, and a school of drawing and music. The public library consists of 27,000 volumes, and there are a museum of natural history, a botanic garden, and a collection of paintings and antiquities, a founding hospital, a theatre, two other hospitals (one military), and a military prison.

Douay is a place of great antiquity: it existed in the time of the Romans, and became under the counts of Flanders a place of considerable importance. Philippe le Bel having a dispute with the count of Flanders, possessed himself of this town A.D. 1297, but it was restored to the counts in A.D. 1368 by Charles V. of France. With the rest of Flanders it passed under the dominions of the kings of Spain; and in A.D. 1552 Philip II. of Spain founded a university here. In 1667 Louis XIV. of France took possession of Douay: it was taken in 1710 by the allies under Marlborough and Eugene, but the French retook it after the English withdrew from the coalition against France. The *arrondissement* is divided into six cantons, and seventy communes: it had in 1832 a population of 92,750. Much flax is grown, and coal is dug in the neighbourhood of the town.

DOUAY BIBLE. [**BIBLE**.]

DOUBLE-BASE, the largest musical instrument of the viol kind. [**VIOL**.] In England, Italy, and France, the double-base has three strings, which are tuned in fourths:

(An octave lower.)

In Germany a fourth string is used, tuned a fourth below the deepest of the above.

The double-base, in full orchestral pieces, takes the notes written for the violoncello, when not otherwise directed, and if these are not too rapid, but always gives them an octave lower. It may be considered as the foundation of the band, for a want of firmness in this instrument is more fatal in its consequences than unsteadiness in any other.

In our concerts the Italian name of this instrument, *Contra-basso* (or, more strictly, *Contrabasso*), is as frequently employed as its English appellation.

DOUBLE STARS. [**STARS**, **DOUBLE**.]

DOUBLOON. [**MONEY**.]

DOUBS, a river in the south-eastern part of France, belonging to the system of the Rhône. It rises in the loftiest ridges of the Jura, at the foot of Mont Rixon, near the village of Mouthe, in the department of Doubs, and flows 75 miles north-east through the lake of St. Point and past the town of Pontarlier to the village of Glovilier, near Porentruy, in Switzerland. Here it makes a sudden bend, and re-entering France, flows 20 miles west-by-south to the town of St. Hypolite, where it receives a small tributary, the Desoubre; below St. Hypolite it makes another bend, and flows north and then north-east 15 miles to the village of Audincourt, where it again turns to the west-by-south and west-south-west, and flows 100 miles, past Clerval, Baume-les-Dames, Besançon, which it nearly encircles [**BESANÇON**], and Dole, to Verdun-sur-Saône, where it joins the Saône. The whole course of the Doubs is about 210 miles. The lower part of its course is in the departments of Jura and Saône et Loire.

The source of the Doubs is copious; it is the outlet of a subterranean reservoir formed by the drainage of a con

terrible surface; but the valley through which it flows in the upper part of its course is narrow, and the stream receives few additions until it reaches Audincourt, just below which it receives the Halle. This part of its course is over limestone; and its waters are partially (in one case, below Pontarlier, almost entirely) absorbed by the cavities which occur in the rock. Near the village of Morteau, a few miles below Pontarlier, there is a fall of 90 ft. The river is used for floating timber and rafts below Audincourt, and occasionally above that place; but the floating is subject to obstruction and danger from the rocks which have rolled down from the mountains into the channel of the river. It was formerly navigable for boats only near the mouth and in some other parts; now, by the formation of the canal from the Rhône to the Rhine, it has been rendered navigable to Clerval. Cuts have been made in some of the parts where the river was very winding, in order to shorten the navigation, which may be estimated at from 75 to 80 miles.

The valley of the Doubs is much wider below Clerval than it is above that place; but it is not very wide in any part; and the affluents of the Doubs are of little importance. The principal are the Laudeux, the Loue, 60 miles long, used for floating timber, the Doraine, and the Guiotte, all which enter the Doubs on the left bank.

DOUBS, a department in France, taking its name from the river Doubs, which has its source and a considerable part of its course within its boundaries. It is on the frontier of France, and is bounded on the south-east side and part of the east side by Switzerland; on the remainder of the east side it is bounded by the department of Haut Rhin; on the north by the department of Haute Saône, and on the west by the department of Jura. This department is irregularly shaped: its greatest length is, from north-east near Montbéliard to south-west near the source of the Doubs, 76 miles: its greatest breadth, at right angles to the length, is from near Marnay on the Oignon to Jougue, on the road from Pontarlier to Lausanne, 48 miles: the area is 2111 square miles, being below the average of the French departments, and about equal to the joint areas of the English counties of Wilts and Berks. The population, in 1832, was 265,535, not much more than two-thirds of the average population of the French departments, and rather less than that of the English county of Sussex; the relative population was 126 to a square mile; the average relative population of France being about 160 to a square mile, and that of England 260. The population is very unequally distributed: in the plains it is far above the average of France, but very thin indeed in the mountainous parts. The department is comprehended between 46° 33' and 47° 33' N. lat., and between 5° 42' and 7° 6' E. long. Besançon, the capital, is 205 miles in a straight line south-east of Paris; or 237 miles by the road through Provins, Troyes, Châtillon-sur-Seine, Dijon, and Dôle.

The south-eastern part of the department is traversed by the ridges of the Jura, which have a general direction north-east and south-west: the summits of Laumont, Chaumont, Mont Dor, and Rissons, are the principal: the last-mentioned is about 2170 feet high, and the highest point in the department. On these summits no vegetation appears; they are composed of bare rocks, covered with snow nearly two-thirds of the year. The slopes of these mountains are rocky, with patches of moss, and straggling thorns and hazels. On the south side the slopes afford good pasturage, and pleasant valleys sheltered by pine forests: in some of the valleys barley and oats are raised, but the temperature is too cold for wheat or rye. The few inhabitants of these highlands preserve the hospitality and simplicity of manners which mark the people of a mountain tract. Between the higher country and the valley of the Doubs is a district of inferior elevation, marked by a milder air and a more productive soil than belong to the district just noticed. Wheat, though in small quantity, is produced; and on some of the more favourable slopes the vine is cultivated; in the woods the oak and the beech replace the pine. Many tracts in this and the more elevated region are marshy, and from them flow the principal streams that water the department. The plain or valley of the Doubs occupies the rest of the department; it is fertile and populous.

The rivers are the Doubs, and its tributaries; and the Oignon, a tributary of the Saône, which, rising in the Vosges, flows south-west into the Saône; it touches the

boundary of this department below Villersexel (Haute Saône), and separates it through a considerable part of its course from the department of Haute Saône. The tributaries of the Doubs which are within this department are, the Drujon, which falls into it below Pontarlier, the Desoubre, the Halle, the Laudeux, and the Loue. The Vaux, the Braine, and the Loison are feeders of the Loue; and the Creuse and the Cusancin are feeders of the Laudeux. There are several lakes, but none of any size except the lake of St. Point, formed by the river Doubs, which is about five miles long and one or two broad.

The canal which unites the navigation of the Rhône with that of the Rhine traverses this department throughout, and consists partly of an artificial channel, partly of that of the river Doubs. The department is ill provided with roads; a road from Paris by Dijon, Besançon, and Pontarlier to Lausanne passes through it: another road from Bâle and Belfort to Dôle and Beaune passes along the valley of the Doubs through Baume les Dames and Besançon: a road from Besançon runs through Quingey to Poligny, in the department of Jura; and another from Pontarlier to Salins and Dôle, both in the department of Jura: another road runs from Besançon to Vesoul, in the department of Haute Saône; and another from Bâle to Clerval, where it falls in with the road from Bâle and Belfort to Besançon. The others are all bye roads.

The mineral treasures of the department are considerable. There were formerly silver mines in Mont Dor, but they are no longer wrought: oxide of iron is procured in abundance; freestone is quarried; and marl, sand proper for making glass, ochre, and a species of inflammable schistus are dug. Peat for fuel is procured in many places. The temperature is variable, and colder than the latitude would give reason to expect: the rains are frequent and heavy, but the climate is not by any means unhealthy. The soil is in different parts composed of sand, clay, or marl, or a combination of these substances. Wheat, rye, mixed corn, maize, hemp, potatoes, pulse, wine, and fruit are produced in the plain; barley, oats, a little flax, and timber in the higher grounds. The agricultural produce, except in barley, and perhaps oats and potatoes, is very far below the average of France. Oats and potatoes form a considerable part of the food of the poorer classes: the Spanish oat is that chiefly cultivated. Agriculture is in a backward state. The quantity of horses and oxen in proportion to the population is very considerable: cattle constitute the wealth of the mountaineer. The artificial grasses are cultivated; trefoil is found to be better suited to the climate than either lucerne or sain-foin. There are extensive common lands, on which cattle are fed. The number of sheep in the department is comparatively very small.

The department is divided into four arrondissemens or sub-prefectures: Montbéliard in the north-east and east, population 55,642; Pontarlier in the south, population 48,977; Besançon in the west, population 96,032; and Baume les Dames, centre and north, population 64,884. These four arrondissemens are subdivided into 27 cantons and 646 communes. The capital, Besançon, on the Doubs, has a population of 24,042 for the town, or 29,167 for the whole commune, and Baume les Dames, also on the Doubs, a population of 2209 for the town, or 2467 for the whole commune. [BAUME; BESANÇON.] Of the other towns we subjoin some account.

Montbéliard is on the little river Halle, just before its junction with the Doubs. It was formerly the capital of a small principality; it is now a thriving and industrious town, the capital of an arrondissement. It is pleasantly situated in the valley which separates the ridges of the Jura from those of the Vosges, and is surrounded by vineyards. It is well built, and adorned by several fountains. An ancient castle, once the residence of the princes of Montbéliard, and in which the archives of their principality are still preserved, commands the town: it now serves as a prison and a barrack for the gendarmerie. The market-house (*bâtiment des halles*) and the church of St. Nicholas, which has a roof 85 feet long by 53 broad without pillars to sustain it, are the buildings most worthy of notice. The inhabitants amounted, in 1832, to 4671 for the town, or 4767 for the whole commune: they manufacture watch movements, watchmakers' files, cotton yarn, hosiery, woollen cloths, kerseymeres, and leather: they carry on a considerable trade with Switzerland. The arrondissement of Montbéliard is distinguished by the prevalence of manufactures

similar to those carried on in the town itself, with the addition of saw manufactories, glass-houses, paper-mills, and oil-mills. The number of tan-yards is great in every part of the department, but especially in this arrondissement.

Pontarlier is on the Doubs, in the upper part of its course, 36 miles south-south-east of Besançon, by the road through Ornans. It is near a natural pass from France into Switzerland, known to the antients, and defended by a fort (the Fort of Joux) on the pyramidal summit of Mont Joux. This fort of Joux was the place of the confinement and death of Toussaint L'Ouverture, the Haytian chief. Pontarlier has been supposed by D'Anville to be the Ariolica of the Itinerary of Antoninus, the Abiolica of the Theodosian Table; but the soundness of his opinion has been disputed: the most ancient records give it the names of Pontalia, Pons Alii, Pons Arletii, and Pons Aris. Until the fourteenth century, there were two adjacent towns, Pontarlier and Morieux, but they now form only one. It has been repeatedly destroyed by fire, the last time in 1754. It is well built, and is surrounded by an antient wall, but not fortified. There are a library, a high school, a custom-house, and a fine range of barracks for cavalry. The population has, from the increase of trade, doubled in the last forty years: the inhabitants, in 1832, amounted to 4248 for the town, or 4707 for the whole commune: they manufacture steel, bar iron, iron and steel goods of various kinds (among them are cannon, nails, steel wire, and watch and clock movements), porcelain, and calicoes: there is a copper foundry, at which are made church bells and cylinders for printing calicoes: there are also tan-yards and paper-mills. A great quantity of extract of wormwood is made here every year. Among the natives of Pontarlier was General d'Arçon, the contriver of the floating batteries at the siege of Gibraltar, in 1782. [Arçon.] The neighbourhood of Pontarlier produces excellent cheese.

Ornans is seventeen miles from Besançon, in the arrondissement of Besançon, on the road to Pontarlier. It is walled: near the walls are the remains of an antient castle: there are a fine hospital and a public library. The inhabitants in 1832 amounted to 2858 for the town, or 2982 for the whole commune: they manufacture a considerable quantity of leather, some paper, cheese, and extract of wormwood. Immediately round the town cherries are cultivated in great quantity; and an excellent kirschwasser is prepared from them. The neighbourhood of Ornans abounds with natural curiosities; as the grottos of Baumarchais, Bonnevaux, Mouthier, and Châteaueux, the cascades of Mouthier, and the well of Breme, which, when the rivers overflow their banks, is filled with a muddy water that rises in it, flows over the top, and inundates the valley in which the well is situated: on these occasions it throws up a number of fishes.

Beside the foregoing, there are in the arrondissement of Montbéliard the towns of Blamont, near the Doubs, and St. Hypolite, or Hippolyte, on that river. Blamont is a fortified town, but is very small. The inhabitants manufactured, at the commencement of the present century, fire-arms, cannon, iron wire, and paper: we have no later account. At St. Hypolite hard-ware is made and cheese. There are many iron factories in the neighbourhood. The town is in a valley, immediately surrounded with vine-covered hills, backed by mountains covered with wood. Near St. Hypolite is a curious cavern, between eighty and ninety feet high, which penetrates horizontally the perpendicular face of a rock: the name of the cavern, 'Le Château de la Roche,' is derived from an antient castle at the entrance, which was ruined in the religious wars of the sixteenth century; the ruins still remain. Audincourt, a village on the Doubs, has a population of 1000: the inhabitants manufacture iron goods and cotton yarn. Mandeure, another village in the arrondissement, is on the site of a Roman town, Epamanduorum. There are the remains of an amphitheatre, and medals and other antiquities have been dug up. At the village of Herimoncourt are manufactured wooden screws, and clock and watch movements: wooden screws are made at Dampierre.

In the arrondissement of Baume les Dames are the towns of Clerval on the Doubs, Rougemont, and Passavant. The inhabitants of Rougemont are engaged in the manufacture of iron goods: at Clerval, the Doubs, by the junction of the Rhône and Rhine Canal, becomes navigable. In the arrondissement of Besançon are the towns of Quingey and Vilafans. Quingey is a town of less than 1000 inhabitants,

who are engaged in the manufacture of iron goods. There is an antient castle, once the residence of the counts of Bourgogne; and near the town is a cavern, adorned with a variety of congelations. Near Boussière, which is not far from Quingey, is a remarkable cavern, consisting of a suite of apartments, extending above half a mile in length.

In the arrondissement of Pontarlier are the towns of Rochejean and Morteau on the Doubs, La Rivière on the Drujon, and Jougue on the border of Switzerland. At Rochejean are smelting houses for pig iron and cast iron, tan yards, and a saw yard; and at La Rivière are a saw yard and a linseed-oil mill. At the village of Levier, and in the neighbourhood, a good deal of cheese is made: near the village is a pit, the depth of which is unknown; it appears to consist of a succession of caverns on different levels: it is used as a receptacle for the carcasses of animal and other refuse. Two dogs which had by accident fallen into one of the caverns lived for a long time on the bodies thus disposed of, and brought forth young before they were discovered and rescued. The village of Mont Benoit (Benedict), on the Doubs, has a handsome Gothic church, formerly the conventual church of a considerable abbey which existed here. The neighbouring village of Remonnot has for its church a remarkable cave.

The department of Doubs sends four members to the Chamber of Deputies; it forms, with the department of Haute Saône, the diocese of the archbishop of Besançon. It is in the jurisdiction of the Cour Royale, or Supreme Court of Besançon, and in the sixth military division, or which the head-quarters are at Besançon. Education is more general in this department than in almost any other in France: there is one boy at school for every eleven persons.

The inhabitants of the mountains are tall, robust, and healthy; sober, economical, gentle, willing to oblige, hospitable, and true to their word, but untaught and credulous: those of the plain are neither so robust, nor temperate, nor obliging. This department is part of the former county of Bourgogne, or Franche Comté. (*Dictionnaire Universel de la France*; Malte Brun; Dupin, *Forces Productives de la France*; *Dictionnaire Géographique Universel*.)

DOUCHE. [BATHING.]

DOUCKER. [DIVERS.]

DOUGLAS FAMILY. This family derives its name from certain lands on the Douglas or Black water, in the shire of Lanark, which were granted out about the middle of the twelfth century by Arnold, Abbot of Kelso, to one Theobald, a Fleming, whose son was thence called William de Douglas.

William married a sister of Friskin de Kordal, in the province of Moray, and had several children, all of whom, except the eldest, settled in the north. Brice, the second son, became bishop of Moray; Alexander, the third son, became sheriff of Elgin; and their sister, Margaret, married Hervey de Keith, great mareschal of the kingdom.

Archenbald, the eldest son, married one of the daughters and co-heiresses of Sir John de Crawford, of Crawford, and had two sons, William and Andrew, each of whom had two sons likewise. William's eldest son married a sister of Lord Abernethy, but dying without issue, was succeeded by his brother, some time governor of the castle of Berwick. Andrew's eldest son married the only daughter of Alexander, lord high steward of Scotland, and had two sons, the eldest of whom was Sir James Douglas of Loudon, so called to distinguish him from his cousin, 'the good Sir James,' one of the chief associates of Bruce in achieving the independence of his country. He was made a knight banneret under the royal standard at Bannockburn, where he commanded the centre division of the Scottish van. He died in a contest with the Saracens when, in fulfilment of the trust committed to him, he was on his way to deposit the heart of Bruce in the Holy Land.

William de Douglas, some time governor of Edinburgh Castle, was a natural son of Sir James of Loudon, whose eldest lawful son, also William de Douglas, had the earldom of Athol conferred upon him on the death of John Campbell without issue; but he soon afterwards resigned the title, and gave a charter of the earldom to Robert, lord high steward of Scotland. This William de Douglas was lord of Liddisdale, and though himself 'the flower of chivalry, as he was called, is to be particularly distinguished from Sir William Douglas, the knight of Liddisdale, natural son of the good Sir James. The knight of Liddisdale long

merited the eulogy which Fordun gives him, of being 'England's scourge and Scotland's bulwark;' but the praise of patriotism, and even of humanity itself, he outlived; for being hurt at Ramsay of Dalwolsay's appointment to the sheriffship of Roxburgh, he waited his opportunity, and came upon the brave and virtuous Ramsay with an armed band, wounded him, and dragged him away to Hermitage castle. There Douglas immured his unoffending victim, faint with thirst, and with his rankling wounds, till, after a period of seventeen days' suffering, death at length terminated his existence. The government of the country was in such a state at the time, that the king not only could not avenge the outrage, but was obliged to pardon the relentless murderer, and moreover to put him into the vacant sheriffship. He at last died by the hand of an assassin of the house of Douglas.

The good Sir James had another natural son, whom we shall mention presently, but having no lawful issue, he was succeeded by his brothers, Hugh and Archibald, the latter of whom married the daughter of John Cumyn, of Badenoch, by Marjory, sister of John Baliol, king of Scotland, and had two sons, the younger of whom, William, inherited the family estates, and became earl of Douglas, in which character we find him lord justiciar of Lothian the year in which King Robert II. ascended the throne. He was thrice married. He married first a daughter of the twelfth earl of Mar, and in her right was styled earl of Douglas and Mar. His son James, second earl of Douglas and Mar, married Margaret, eldest daughter of King Robert II., but leaving no surviving male issue, the earldom of Mar devolved on his sister, and the earldom of Douglas on Archibald Douglas, the natural son of the good Sir James above alluded to, by special settlement. This Archibald, third earl of Douglas, styled from his great prowess 'Archibald the Grim,' had himself a natural son, who married a daughter of King Robert II.

William, the first earl of Douglas, had no children by his second marriage. By his third marriage, which was with the Lady Margaret, sister and heir of the third earl of Angus, he had a son, George, who obtained, on his mother's resignation, a grant of the earldom of Angus. He also got a grant of the sheriffship of Roxburgh, and is found in that office anno 1398. The previous year he married Mary, second daughter of King Robert III.

Sir John Douglas, who gallantly defended the castle of Lochleven against the English in the minority of David II., was a younger brother of William, lord of Liddisdale, above mentioned. He had several children, three of whom only however we shall here notice, James, Henry, and John. The last of these married Mariota, daughter of Reginald de Cheyne, co-justiciar of Scotland beyond the Grampians, with John de Vaux. Sir Henry married a niece of King Robert II., and by her had a son, who married a granddaughter of the same king. Sir James, the eldest, succeeded his uncle, the lord of Liddisdale, in the lordship of Dalkeith and his other extensive possessions. He was twice married, his second wife being a sister of King Robert II. His eldest son, by his first marriage, married a daughter of King Robert III., and had a grandson, who married Johanna, daughter of King James I., and relict of James, third earl of Angus, and was on the 14th March, 1457-8, created earl of Morton.

We have thus three earls of the House of Douglas: the earl of Douglas, the earl of Angus, and the earl of Morton.

Archibald IV., earl of Douglas, eldest son of Archibald the Grim, married the eldest daughter of king Robert III., and by her had a son of the same name, who in the lifetime of his father was styled earl of Wigton. On the death of King James I. he was chosen one of the council of regency, and the next year made lieutenant-general of the realm. His two sons, particularly William, the young earl of Douglas, despising the authority of an infant prince, and encouraged by the divisions which arose among the nobility, erected a sort of independent power within the kingdom, and forbidding the vassals of the house to acknowledge any other authority, created knights, appointed a privy council, and assumed all the exterior of royalty. They were both at length however beheaded, and the earldom of Douglas passed to a grand-uncle whose eldest son married his cousin, the fair maid of Galloway, and restored the house to its former splendour. He became lieutenant-general of the kingdom, and no less formidable to the crown than the last in his family who held that high office. But this

power proved his ruin, and dying without issue, he was succeeded by his brother, in whom this great branch of the house of Douglas was cut down and overthrown for treason.

Archibald V., earl of Angus, great-grandson of William, first earl of Douglas, through George, who obtained the earldom of Angus on his mother's resignation as above mentioned, was some time warden of the East Marches, and on the death of Argyle was made lord high chancellor of the kingdom, and so continued till 1498, when he resigned. He was commonly called 'the Great Earl of Angus;' and, according to the historian of his house, was 'a man every way accomplished both for mind and body.' Gavin, bishop of Dunkeld, the translator of Virgil, was his third son by his first marriage, which was with a daughter of the lord high chamberlain of Scotland. The bishop's two elder brothers, George, master of Angus, and Sir William Douglas of Glenbervie, fell on the fatal field of Flodden; and their father, the old earl, who had in vain dissuaded the king from the ruinous enterprise, bending under the calamity, retired into Galloway, and soon after died. Sir Archibald Douglas of Kilspindie, the earl's son by a second marriage, was made lord treasurer of Scotland towards the end of the year 1526, by king James V., who used to style him his 'Grey Steil;' and the next year we find Archibald VI., earl of Angus, eldest son of the deceased George, master of Angus, lord high chancellor of the kingdom. This Archibald, the sixth earl of Angus, married Margaret of England, queen dowager of James IV., and had by her a daughter, who became the mother of Henry, lord Darnley, husband of Mary queen of Scots, and father of James I. of England. His brother, Sir George, was forfeited on his fall, and spent the remainder of James's reign in exile in England; and their sister Jean was burnt as a witch on the castle hill of Edinburgh. The son of Sir George succeeded his uncle as seventh earl of Angus; and on the death of his son, the eighth earl, commonly called 'the Good Earl of Angus,' without male issue, Sir William Douglas of Glenbervie, great-grandson of Archibald the great earl, succeeded to the earldom, and had soon afterwards a charter from king James V., confirming all the ancient privileges of the Douglas, namely, to have the first vote in council, to be the king's lieutenant, to lead the van of the army in the day of battle, and to carry the crown at coronations.

The seventh earl of Angus had a younger brother, who became fourth earl of Morton, and was the famous Regent Morton. He was condemned to death for the murder of Darnley, and was executed by the *maiden*, an instrument which he himself introduced into Scotland.

Sir William Douglas of Glenbervie above mentioned conveyed the lands of Glenbervie to a younger son. His eldest son became tenth earl of Angus; and the son of the latter was in 1633 created marquis of Douglas, the same year in which another branch of the Douglas family was advanced to be earl of Queensberry. Archibald, eldest son of the first marquis of Douglas, officiated as lord high chamberlain at the coronation of king Charles II., and was thereupon created earl of Ormond. His younger brother William had been some years before created earl of Selkirk; but marrying afterwards Anne, duchess of Hamilton, he was on her grace's petition created duke of Hamilton for life, and a new patent of the earldom of Selkirk issued in favour of his younger sons, two of whom were themselves also elevated to the peerage. The third marquis of Douglas was advanced to be duke of Douglas; but on his death the dukedom became extinct, and the marquise devolved on the seventh duke of Hamilton. His grace was one of the party to the great 'Douglas cause,' the subject of which was the Douglas estates; but these were ultimately awarded to his opponent, who becoming entitled to the estates, assumed the name and arms of Douglas, and in 1790 was raised to the peerage as baron Douglas of Douglas castle, in the shire of Lanark.

The year following, George, 16th earl of Morton, was enrolled among the peers of Great Britain as baron Douglas of Lochleven. The third earl of Queensberry had previously been raised to a marquise and dukedom; and the fourth duke of Queensberry, who was also third earl of March, made a peer of England by the title of baron Douglas of Amesbury; but on the death of his grace in 1810, the English barony, conferred upon himself, and the earldom of March, conferred upon his grandfather, expired; while the dukedom devolved on the duke of Buccleuch, and the

original peerage descended to the present marquis of Queensberry.

DOUGLAS, GAWIN, was born in the year 1474 or 1475, and was the third son of Archibald, sixth earl of Angus, surnamed Bell-the-Cat. (Scott's *Marmion*, canto vi., st. xi.) Being intended for the church, he received the best education which Scotland and France could give. He obtained successively the provostship of the collegiate church of St. Giles's, Edinburgh, and the rectorship of Heriot church. He was then made abbot of Aberbrothick, and lastly, bishop of Dunkeld, but his elevation to the archbishoprick of St. Andrews was prevented by the pope. In 1513 some political intrigues compelled him to retire to England, where he was favourably received by Henry VIII. He died of the plague in 1521 or 1522, at the Savoy, where he had resided during the whole of his stay.

In his early years he translated Ovid's 'Art of Love,' and composed two allegorical poems, 'King Hart' and 'the Palace of Honour:' but he is best and most deservedly known by his translation of Virgil's 'Æneid,' which, with the thirteenth book by Mapheus Vegius, was produced in 1513. To each book is prefixed an original prologue, some of which give lively and simple descriptions of scenery, written in a manner which proves their author to have been possessed of considerable poetical power.

At the end of the work (p. 380, ed. of 1553), he informs us that 'compilet was this work Virgilean' 'in eighteen moneths space,' for two months whereof he 'wrote never one word.' He is also solicitous that his readers should

— 'read leal, and take good tent in time
They neither maul nor mismetre his rhyme:'

which reminds us of Chaucer's address to his book—

'So pray I God that none miswrite thee,
Nor thee mismetre for default of tongue.'

Those who take the trouble to examine Douglas for themselves, will find his language not near so different from our own as might be imagined from a cursory glance at the pages. The chief difference consists in the spelling and the accent, which we may suppose to have borne, as in Chaucer, a considerable resemblance to the present pronunciation of French; at least without some such supposition it will be found impossible to scan either. (Warton's *Hist. Engl. Poetry* (who gives copious extracts), and *Biog. Brit.*, art. 'Douglas.')

DOUGLAS. [MAN, ISLE OF.]

DOUR. [HAINAULT.]

DOURA, or DURRA. [SORGHUM VULGARE.]

DOURO in Portuguese, Duero in Spanish, one of the principal rivers of the Peninsula, rises in the Sierra de Urdion in the north part of the province of Soria in Old Castile. It first flows southwards, passing by the town of Soria, then turns to the west, through the provinces of Burgos, Valladolid, and Zamora, and receives numerous affluents both from the north and the south, the principal of which are, 1. the Pisuerga, which rises in the Asturian mountains, and after receiving the Alanzon from Burgos and the Carcion from Palencia, passes by Valladolid, and enters the Douro above Tordesillas; 2. the Seguillo, also from the north, passes by Medina del Rio Seco, and joins the Douro above Zamora; 3. the Esla, a large stream, comes from the mountains of Leon, and enters the Douro below Zamora. After receiving the Esla, the Douro reaches the frontiers of Portugal, where it turns to the south, and for about fifty miles marks the boundary between the province of Salamanca in Spain, and that of Trás-os-Montes in Portugal. In this part of its course it receives first the Tormes, a considerable stream, from the south-east, which rises in the lofty Sierra de Gredos, and passes by Salamanca, and then further south the Agueda, from Ciudad Rodrigo. The Douro then turns again to the west, and crosses the north part of Portugal, marking the limits between the provinces of Trás-os-Montes and Entre Douro e Minho on its north bank, and the province of Beira on its south bank. The principal affluents of the Douro in Portugal are the Coa from the south, and the Sabor and Tamega from the north. The Douro passes by the towns of Lamego and Oporto, and enters the Atlantic below the latter city, of which it forms the harbour. The whole course of the Douro with its windings is nearly 500 miles, through some of the finest and most fertile regions of Spain and Portugal.

DOUW, GERARD, was born at Leyden in 1613. In 1622 he was put by his father, a glazier, to study drawing under Bartholomew Dolendo, an engraver, with whom he

remained eighteen months. He afterwards received the instructions of Peter Kouwboorn, a painter on glass, and learned his art so well that he proved of great advantage to his father. The latter, however, alarmed at the danger he incurred by mounting to his work at church windows, made him study painting instead, and the illustrious Rembrandt was chosen for the lad's master. From that great painter Gerard learned the mastery of colour and chiaroscuro; but he differed entirely from his teacher in his manner of painting. Instead of growing bolder and rougher in his handling as he grew older, he became more and more delicate in his finish, elaborating everything which he touched with the most exquisite delicacy and minuteness, in so much that the threads of brocades, and of fine carpets are expressed even in his smallest paintings. Nothing escaped his eye nor his pencil. And yet with all his elaboration of detail his pictures are powerful in effect, and harmonious and brilliant in colour. He was accustomed to prepare his own tools, that he might have them of the requisite fineness.

Gerard Douw has been charged with excessive slowness in finishing; and some anecdotes are told in proof of it. Sandrart says, that he once visited Gerard's study in company with Bamboccio, and on their both expressing their admiration of a certain miniature broom-handle in one of his pictures, he said, that he should spend three more days upon it, before he left it. It is said that his sitters were so wearied by his dilatoriness, and disgusted by the transcripts of their jaded faces, which he faithfully put upon the canvass, that others were deterred from sitting, and he was obliged to abandon portrait-painting. But Karel de Moor, who had been a pupil of his, averred that he was not so slow as had been asserted; and the number of his pictures tends to corroborate his statement. Douw got excellent prices for his paintings; generally from 600 to 1000 florins; and Sandrart informs us that Spiering, a gentleman of the Hague, paid him an annual salary of 1000 florins, for the mere right of refusal of all the pictures he painted, at the highest price he could obtain. Gerard Douw died in 1680. The most famous among his pupils was Mieris. His pictures are in all great collections. (Argenville; Sandrart.)

DOVE. [COLUMBIDÆ.]

DOVEDALE. [DERBYSHIRE.]

DOVER, one of the Cinque Ports, a borough and market-town, having separate jurisdiction, in the eastern division of the county of Kent, 16 miles south-east by south from Canterbury and 72 east-south-east from London. Dover is situated on the coast, at the opening of a deep valley formed by a depression in the chalk hills, which here present a transverse section to the sea. This depression runs into the interior for several miles, and forms the basin of a small stream.

Dover was called by the Saxons Dwyrr, from dwyrh (a steep place), or from dwr (water), there being a small stream in the valley at the extremity of which Dover stands. By the Romans it was called Dubris, whence Dover.

From its proximity to the continent, Dover has for many years been the usual port of embarkation for passengers going both from and to England. [CALAIS.] In the reign of Henry VIII. the emperor Charles V. landed here, and Henry on that occasion contributed a large sum for the erection of a pier, which was subsequently completed in the reign of Elizabeth. The castle, which is on the northern side of the town, is supposed to have been originally constructed by the Romans. The southern heights of Dover were originally strongly fortified during the late war, and extend in a semicircle as far as the famous Shakespeare's Cliff, so called from the celebrated scene in 'King Lear.'

The boundaries of the present borough, in addition to the old borough, include a part of the parish of Buckland, and comprise a population of 15,298 persons; 1651 were registered after the passing of the Reform Act. The borough sends two members to parliament. It appears from the Municipal Corporation Report to be doubtful whether there are any charters. A court of record is held three times a week. The general sessions are held three times a year before the recorder and other justices. There was a hundred court, but it has fallen into disuse. The town consists principally of one street about a mile long, running in the direction of the valley. A theatre and assembly-room were erected in 1790. The town is now considered a fashionable watering-place, and possesses every convenience for sea-bathing. Many handsome houses have recently been built for the accommodation of visitors in the season. The harbour is not very good, but it can accommodate ships

of 500 tons, and is principally used for sailing and steam packets to France. It has now for some years (1837) been undergoing repairs and improvements, but it does not seem probable that it can ever be made a good port. Some corn is ground in the neighbourhood, and exported to London; and there are some paper-mills near the town. The market-days are Wednesday and Saturday. An annual fair is held on the 23rd of November.

There are two churches, St. James's and St. Mary's; the former worth 145*l.*, the latter 287*l.* per annum; as well as a new church, and places of worship for Baptists, Society of Friends, Independents, Wesleyan Methodists, Unitarians, and Roman Catholics. A charity-school for boys and girls was founded in 1789; it has received various donations, and in 1820 a new building, capable of containing 200 boys and 200 girls, was erected. The hospital of St. Mary, afterwards called the Maison-Dieu, was founded in the 13th Henry III. by Hubert de Burgh, earl of Kent and chief justice of England. [CINQUE PORTS.]

DOVETAIL, a term in joinery. A dovetail is the end of a piece of wood fashioned into the fan-like form of a dove's tail, and let into a corresponding hollow of another piece of wood. Dovetails are either exposed or concealed; 'concealed dovetailing is of two kinds, lapped and mitred.' (Nicholson's *Dict.*)

DOVRAFIELD. [NORWAY.]

DOWER (Law) is that part of the husband's lands, tenements, or hereditaments which come to the wife upon his death, not by force of any contract expressed or implied between the parties, but by operation of law, to be completed by an actual assignment of particular portions of the property.

Prior to the reign of Charles II., five, and until the passing of the act 3 & 4 Wm. IV., c. 105, four kinds of dower were known to the English law.

1. Dower at the common law.
2. Dower by custom.
3. Dower ad ostium ecclesiæ.
4. Dower ex assensu patris.
5. Dower de la plus beale.

This last was merely a consequence of tenure by knight's service, and was abolished by stat. 12 Charles II. c. 24; and the 3rd and 4th having long become obsolete, were finally abolished by the above-mentioned statute of Wm. IV.

By the old law, dower attached upon the lands of which the husband was seised at any time during the marriage, and which a child of the husband and wife might by possibility inherit; and they remained liable to dower in the hands of a purchaser, though various ingenious modes of conveyance were contrived, which in some cases prevented the attaching of dower: but this liability was productive of great inconvenience, and frequently of injustice. The law too was inconsistent, for the wife was not dowerable out of her husband's equitable estates, although the husband had his courtesy in those to which the wife was equitably entitled. [COURTESY.] To remedy these inconveniences the statute above mentioned was passed, and its objects may be stated to be, 1, to make equitable estates in possession liable to dower; 2, to take away the right to dower out of lands disposed of by the husband absolutely in his life or by will; 3, to enable the husband, by a simple declaration in a deed or will to bar the right to dower.

'The law of dower,' say the Real Property Commissioners, in their Second Report, upon which this statute was founded, 'though well adapted to the state of freehold property which existed at the time when it was established, and during a long time afterwards, had, in consequence of the frequent alienation of property which takes place in modern times, become exceedingly inconvenient.' In short, dower was considered and treated as an incumbrance, and was never, except in cases of inadvertency, suffered to arise. The increase of personal property, and the almost universal custom of securing a provision by settlement, afforded more effectual and convenient means of providing for the wife. Dower at the common law is the only species of dower which affects lands in England generally; dower by custom is only of local application, as dower by the custom of gavelkind and Borough English; and freebench applies exclusively to copyhold lands. The former is treated of in Robinson's 'History of Gavelkind,' the latter in Watkins on 'Copyholds.'

In order to describe dower at the common law clearly, it will be advisable to follow the distribution of the subject made by Blackstone.

1. Who may be endowed.
2. Of what a wife may be endowed.
3. How she shall be endowed.
4. How dower may be barred or prevented.

1. *Who may be endowed*.—Every woman who has attained the age of nine years is entitled to dower by common law, except aliens, and Jewesses, so long as they continue in their religion. And from the disability arising from alienage, a queen, and also an alien licensed by the king, are exempt.

2. *Of what she may be endowed*.—She is now by law entitled to be endowed, that is, to have an estate for life in the third part of the lands and tenements of which the husband was solely seised either in deed or in law, or in which he had a right of entry, at any time during the coverture, of a legal or equitable estate of inheritance in possession, to which the issue of the husband and wife (if any) might by possibility inherit.

3. *How she shall be endowed*.—By Magna Charta it is provided, that the widow shall not pay a fine to the lord for her dower, and that she shall remain in the chief house of her husband for forty days after his death, during which time her dower shall be assigned. The particular lands and hereditaments to be held in dower must be assigned by the heir of the husband, or his guardian, by metes and bounds if divisible, otherwise specially, as of the third presentation to a benefice, &c. If the heir or his guardian do not assign, or assign unfairly, the widow has her remedy at law, and the sheriff is appointed to assign her dower; or by bill in equity, which is now the usual remedy.

4. *How dower may be barred or prevented*.—A woman is barred of her dower by the attainder of her husband for treason, by her own attainder for treason, or felony, by divorce *à vinculo matrimonii*, by elopement from her husband and living with her adulterer, by detaining the title-deeds from the heir at law, until she restores them, by alienation of the lands assigned her for a greater estate than she has in them; and she might also be barred of her dower by levying a fine, or suffering a recovery during her marriage, while those assurances existed. But the most usual means of barring dower are by jointures, made under the provisions of the 27 Hen. VIII., c. 10; and by the act of the husband. Before the stat. 3 & 4 Wm. IV., c. 105, a fine or recovery by the husband and wife was the only mode by which a right to dower which had *already attached* could be barred, though, by means of a simple form of conveyance, a husband might prevent the right to dower from arising at all upon lands purchased by him. By the above-mentioned statute, it is provided that no woman shall be entitled to dower out of any lands absolutely disposed of by her husband either in his life or by will, and that his debts and engagements shall be valid and effectual as against the right of the widow to dower. And further, that any declaration by the husband, either by deed or will, that the dower of his wife shall be subjected to any restrictions, or that she shall not have any dower, shall be effectual. It is also provided that a simple devise of real estate to the wife by the husband shall, unless a contrary intention be expressed, operate in bar of her dower. This statute however affects only marriages contracted, and only deeds, &c., subsequent to 1st January, 1834.

Most of these alterations, as indeed may be said of many others which have recently been made in the English real property law, have for some years been established in the United States of America. An account of the various enactments and provisions in force in the different states respecting dower may be found in 4 Kent's *Commentaries*, p. 34-72. (Bl. *Com.*; Park on *Dower*.)

DOWLETABAD, a strongly fortified town in the province of Aurungabad, seven miles north-west from the city of Aurungabad, in 19° 57' N. lat., and 75° 25' E. long. The fort consists of an enormous insulated mass of granite, standing a mile and a half from any hill, and rising to the height of 500 feet. The rock is surrounded by a deep ditch, across which there is but one passage, which will allow no more than two persons to go abreast. The passage into the fort is cut out of the solid rock, and can be entered by only one person at a time in a stooping posture. From this entrance the passage, still cut through the rock and very narrow, winds upwards. In the course of this passage are several doors by which it is obstructed, and the place is altogether so strong, that a very small number of persons within the fort might bid defiance to a numerous army. On the

other hand, the fort might be invested by a very considerable force, so as effectually to prevent any supplies being received by the garrison, who, owing to the intricacy of the outlet, could never make an effective sally. The lower part of the rock, to the height of 180 feet from the ditch, is nearly perpendicular, and it would be wholly impracticable to ascend it. The rock is well provided with tanks of water.

Since the seat of government has been transferred to Aurungabad the town of Dowletabad has greatly decayed; only a small portion of it is now inhabited. This place is said to have been the residence of a very powerful rajah in the thirteenth century, when the Mohammedans under Allah ud Deen carried their arms into this part of the Deccan. In 1306 the fort and surrounding country were brought under the dominion of the emperor of Delhi. About the close of the sixteenth century they were taken by Ahmed Nizam Shah of Ahmednuggur, and in 1634, during the reign of Shah Jehan, again came into the possession of the Moguls. Dowletabad has since followed the fate of that part of the Deccan, having been conquered by Nizam ul Mulk, with whose successors, the Nizams of Hyderabad, it has since remained.

DOWN, the fine hair of plants, is a cellular expansion of the cuticle, consisting of attenuated thin semitransparent hairs, either simple or jointed end to end, or even branched, as in the Mullein. When attached to seeds, it enables them to be buoyed up in the air and transported from place to place. When covering the external surface of a plant, it undoubtedly acts as a protection against extremes of temperature, and probably as a means of absorbing moisture from the air.

DOWN, a maritime county of the province of Ulster in Ireland; bounded on the north by an angle of Loch Neagh, the county of Antrim, and the bay of Belfast; on the east and south by the Irish channel; and on the west by the counties of Louth and Armagh, from which it is partly separated by the bay of Carlingford and the river of Newry. The greatest length from Cranfield point on the south-west to Orlock point on the north-east is 61 English miles; greatest breadth from Moyallan on the west to the coast near Ballywalter on the east, 38 miles. The coast line (including Lough Strangford) from Belfast to Newry, exclusive of small irregularities, is about 125 English miles. The area, according to the Ordnance Survey of Ireland, consists of—

| Water | 3,502 | 1 | 14 |

Total 611,917 3 29

Statute measure, or 956 square statute miles nearly.

Down forms the south-eastern extremity of Ulster. The surface of nearly all the county is undulating; but the only uncultivated district is that occupied by the Mourne mountains and the detached group of Slieve Croob. The mountainous district of Mourne is bounded on the east by the bay of Dundrum and on the west by the bay of Carlingford, and covers an area of nearly 90 square miles. Beginning from the west, the principal elevations are Cleomack, 1257 feet; Tievodockaragh, 1557 feet; Eagle Mountain, 2084 feet, having on the north Rocky Mountain, 1328 feet, and on the south Finlieve, 1888 feet; Slieve Muck North, 2198 feet, from the north-western declivity of which the river Bann takes its rise at an altitude of 1467 feet; Slieve Muck South, 1931 feet; Slieve Bingian, 2449 feet; and north of these Chimney Rock Mountains, 2152 feet; Slieve Bearagh, 2394 feet; Slieve Corragh, 2512 feet; and Slieve Donard, 2796 feet, the highest ground in the county, which overhangs the sea above Newcastle, a small town situated on the western shore of Dundrum bay. This mountain group contains much fine scenery. Its north-eastern declivities are clothed for several miles with the plantations of Tullymore Park, the splendid residence of the Earl of Roden; its western flanks overhang the beautiful vicinities of Warren's Point and Roostrevor, and on the narrow strip between its southern declivities and the sea is situated the fine demesne of Mourne Park the residence of the Earl of Kilmorey. The Slieve Croob range covers an area of about ten square miles to the north-east of the Mourne Group. Slieve Croob, the highest elevation of the range, has an altitude of 1766 feet; on its north-eastern declivity the river Lagan rises at an elevation of about 1860 feet above the level of the sea.

The remainder of the county, about 850 square miles is productive, being either under cultivation or serving the purposes of turbary. The numerous hills which diversify the surface are seldom too high for arable cultivation; and the irregularity of the surface facilitates drainage, and likewise affords a shelter, which, from the scarcity of timber in some parts of the county, is of material advantage. A low chain of cultivated eminences, well timbered, and on the northern and western side covered with the demesnes and improvements of a resident gentry, commences east of Dromore, and extends under various names along the valley of the Lagan and the eastern shore of Belfast Loch, as far as Bangor. The only detached eminence of any consequence is the hill of Scrabo at the head of Loch Strangford, 534 feet. This range separates the basin of the Lagan from that of Loch Strangford.

The eastern shore of Belfast Loch has no anchorage for vessels above the third class. There is a small quay for fishing and pleasure-boats at Cultra, a mile below the bathing village of Holywood, where regattas are held. Out of Belfast Loch the first harbour on the coast of Ards is at Bangor, where a pier was built by parliamentary grant in 1757, forming a small harbour in the south-east part of the bay of about 300 ft. square. Fifteen sails of carrying vessels belong to this place, which are chiefly engaged in the export of corn and cattle to the coast of Scotland. Colonel Ward, the proprietor, is engaged in the construction of a pier, which, when completed, will afford fifteen feet at low water within the harbour. The coast here consists of low slate rocks; and there is a difficulty in getting stones of a sufficient size, which has hitherto retarded the completion of this desirable work. East of Bangor is the little harbour of Groomsport or Gregory's Port, where Duke Schomberg landed in 1690. Here is a small quay and about 100 houses, chiefly occupied by fishermen. South-east of Groomsport is Donaghadee, the only place of security for a large vessel from Belfast Loch south to the harbour of Strangford. [DONAGHADEE.] Off Donaghadee lie three islands, called the Copelands, from a family of that name which formerly held the opposite coast. On one of these, called the Cross or Lighthouse Island, there is a lighthouse, which marks the entrance to Belfast Loch from the south. This building, which was erected about 1715, is a square tower, 70 ft. high to the lantern: the walls 7 ft. thick. The mode of lighting practised in 1744, when Harris wrote his 'History of Down,' was by a fire of coals kindled on a grate, which was fixed on an iron spindle rising from the masonry. On a windy night this grate used to consume a ton and a half of coal. This island contains 40 acres; the other two, 295 and 31 acres respectively. The sound between Big Island, which lies nearest the land, and the shore of Down, is about a mile and a quarter in breadth. It has from 7 to 8 fathoms of water; but the side next the mainland is foul; and a rock, half a mile from the shore, called the *Deputy*, which has but 10 ft. of water at low ebb, renders the navigation difficult in hazy weather.

From Donaghadee south the coast is low, rocky, and dangerous. The rock of Sculmartin, covered at half-flood, and the North and South Rocks, the former never covered, the latter at every half tide, lie farthest off shore, and are most in the way of vessels coming up channel. The lighthouse of Kilwarlin was erected on the South Rock in 1797, and has since proved highly serviceable to all traders in the channel. At Ballywalter, Ballyhalbert, Cloghy, and Newcastle, in Quintin Bay, all situated on the eastern shore of Ards, are fishing stations. The first is very capable of improvement as a harbour, and there is a small quay for the supply of the Kilwarlin Lighthouse at the latter; but no shelter in any of them for vessels of more than 30 tons.

South from Newcastle is Tara Bay, much frequented by fishing-vessels, and capable of great improvement. The estimated expense of a breakwater pier, which would convert it into an excellent tide harbour, is 38067. The peninsula of Ards runs out at Ballyquintin to a low rocky point south of Tara Bay. A rock, called the Bar Pladdy, having 11 ft. water at spring ebbs, lies immediately off Quintin Point; and the entrance to Strangford Loch is erroneously laid down in Mackenzie's Map as lying through the narrow intermediate channel called Nelson's Gut. Several shipwrecks have occurred in consequence. The true entrance to Strangford Loch lies west of the Bar Pladdy, between it and Killard Point, on the opposite side. The entrance is a narrow channel of about 5 miles in length by an average

breath of less than a mile. Within, the loch of Strangford expands into a very extensive sheet of water, extending northwards to Newtownards, and nearly insulating the district between it and the sea. The tide of so large a sheet of water making its way to and from the sea, causes a great current in the narrow connecting strait at every ebb and flow, and renders the navigation at such times very difficult. Across this strait is a ferry, which gives name to the town of Portaferry at the eastern or Ards side of the entrance. The town of Strangford, which lies opposite, is supposed to derive its name from the strength of the tide race between. The true channel, at the narrowest part of the strait, is little more than a quarter of a mile across, being contracted by rocks, one of which, called the Ranting Wheel, causes a whirlpool dangerous to small craft. There is another but less dangerous eddy of the same kind at the opposite side. Within the entrance there are several good anchorages, and landing-quays at Strangford, Portaferry, Killileagh, the quay of Downpatrick, and Kirkeubbin. Killileagh quay was built by parliamentary grant in 1765, and cost 1200*l.*, but is now much gone to decay. Strangford Loch contains a great number of islands, many of which are pasturable, and great numbers of rabbits are bred in them. From Killard Point the coast bears south-west, and is rocky and foul as far as Ardglass, where there is a pretty good harbour, safe for small vessels, by which it is much frequented, but exposed to a heavy ground swell in south-easterly gales. A pier was built here about 1819 at the joint expense of the old fishery board and the proprietor, Mr. Ogilvie. There is a small lighthouse at the extremity of this pier. Ardglass is a principal place of resort for the fishing fleets which frequent the channel. Immediately west of Ardglass lies the harbour of Killough, between Ringford Point on the east and St. John's Point on the west. A natural breakwater, easily improvable, extends between these points, and gives a pretty secure anchorage for large vessels within. There is an inner harbour for small craft, dry at ebb, with a quay, built about the beginning of the last century.

West of St. John's Point opens the great bay of Dundrum, which extends from this point on the east to the coast of Mourne on the west, a distance of about four leagues by a league in depth, running north by west. This bay is exposed, shallow, and full of quicksands, and so situated that, till the erection of the present pier, which forms a small asylum harbour at Newcastle, a well-frequented bathing-place on the south-western side of the bay, vessels embayed here with an east or south-east wind inevitably went on shore. From an inspection of the books of the resident revenue officer stationed at Newcastle, it has been ascertained that from 1783 to 1835, 58 vessels, valued at 209,050*l.*, have been wrecked in Dundrum Bay. The pier of Newcastle was erected at the joint expense of the old fishery board and the proprietor, Earl Annesley: the cost was 3,600*l.* It is highly serviceable as a station for the fishing-boats of the coast, and has been the means of saving four vessels within the last three years.

From Newcastle south to Cranfield Point the coast of Mourne possesses only three small boat harbours, the principal of which is at Derryogua, where there is a fishing station. On this part of the coast, near Kilkeel, is a lighthouse, 120 feet high. Between Cranfield Point on the east, and the extremity of the barony of Dundalk, in the county of Louth, on the west, is the entrance to the extensive harbour of Carlingford. This loch is about eight miles long by a mile and a half broad, and has steep mountains to the east and west along each side. From Narrow Water, where it contracts to the width of a river, the tide flows up to Newry, whence there is a canal communication with the Upper Bann river, which flows into Loch Neagh. There are numerous rocks and shoals at the entrance, where a new lighthouse is about being erected, and a bar all across, on which there are but eight feet of water at ebb tides. The middle part of the loch is deep, but exposed to heavy squalls from the mountains. The best anchorages are off Carlingford, on the south side, and opposite Warren's Point, and Rosstrevor, in the county of Down. There are two great beds of oysters in this loch, one off Rosstrevor Quay, two and a half miles long by half a mile broad; the other off Killowen Point, one mile long by half a mile broad. The Marquis of Anglesey is the proprietor. The fishery is open to all persons paying 5*s.* yearly. About 1000*l.* worth of oysters are taken annually: they sell in

Warren's Point at 7*s.* to 15*s.* per thousand, and are celebrated throughout Ireland for their excellent flavour. It has been proposed to carry the Newry canal, which terminates at Fathom, at the head of the bay, forward to the deep water off Warren's Point, where it is intended that it should terminate with a ship lock and floating basin. Warren's Point has a good quay, from which steamers sail regularly for Liverpool: most of the exports of Newry are shipped here from the small craft that bring them down the canal. The scenery on both sides of Carlingford Loch is of striking beauty.

With the exception of the Upper Bann, all the rivers of Down discharge their water into the Irish channel. The navigable river Lagan, which, throughout near half of its course, has a direction nearly parallel to the Bann, turns eastward at Magheralin, four miles north-east of which it becomes the county boundary, and passing by Lisburn, falls into the bay of Belfast, after a course of about thirty miles. The Ballynahinch or Annacloy river brings down the waters of several small lakes south-east of Hillsborough, and widens into the Quoile river, which is navigable for vessels of 200 tons a mile below Downpatrick, where it forms an extensive arm of Strangford Loch. The Quoile is covered with numerous islands, and its windings present much beautiful scenery. The Newry river rises near Rathfriland, and flowing westward by the northern declivities of the Mourne range, turns south a little above Newry, and after a short course falls into the head of Carlingford Loch. Numerous streams descend from the district of Mourne immediately to the sea, and there is no part of the county deficient in a good supply of running water.

The Lagan navigation, connecting Loch Neagh with Belfast Loch, gives a line of water communication to the entire northern boundary of the county; and the Newry Canal, connecting the navigable river Bann with the bay of Carlingford, affords a like facility to the western district, so that, with the exception of about ten miles between the Bann and the termination of the Lagan navigation, the entire county boundary is formed either by the coast line or by lines of water carriage. The Lagan navigation was commenced in 1755, and cost upwards of 100,000*l.*, but owing to mismanagement and the difficulties of keeping a rapid river navigation in repair, it has not proved a profitable speculation. The summit level, towards Loch Neagh, is 112 feet above the level of the sea.

The Newry Canal admits vessels of 50 tons through the heart of Ulster. It was commenced in 1730, by commissioners appointed under an Act of the Irish Parliament, passed in the 3rd of George II., and was wholly constructed by government. The original object was chiefly to afford a water carriage for the coals of Tyrone district to Dublin. The canal lies partly in the county of Down and partly in Armagh; it extends, from its junction with the Bann river near Guilford, to Fathom, on the bay of Carlingford, about 14 Irish or 17½ English miles, having its summit level 77 feet above the sea. The average breadth of the canal at top is 40 feet: the locks are 15 in number, and 22 feet in the clear. The canal was opened in 1741, but being among the first works of the kind attempted in Ireland it required numerous repairs, and has not yet made any considerable return for the original outlay. From the year 1802 to the year 1817, the total amount of toll received was 27,838*l.* 13*s.* 6*d.*, and the total expenditure was 70,495*l.* 18*s.* 8*d.*, and for the succeeding ten years the gross receipts were 25,461*l.* 19*s.* 6*d.*, and the gross expenditure 16,897*l.* 14*s.* 7*d.* This navigation was vested in the directors-general of Ireland navigation down to 1827. It is now under the control of the Board of Works.

Down is well supplied with roads. The great northern road from Belfast to Dublin passes through the county from north to south, by Hillsborough, Dromore, Banbridge, Loughbrickland, and Newry: this is the only turnpike road in Down. The other chief lines are from Belfast to Donaghadee by Newtownards; from Belfast to Downpatrick by Ballynahinch; and from Downpatrick to Newry by Castlewellan and Rathfriland. The roads in general are hilly, but well constructed, and kept in excellent repair by the grand jury. The Ulster Railroad, from Belfast to Armagh, will pass through parts of the parishes of Moira and Shankill in this county. The entire length, when completed, will be 36 miles and 291 yards. A railroad has been projected from Belfast to Hollywood, a bathing-place much resorted to by the citizens of Belfast in summer

The vicinity of the sea prevents the continuance of frosts on the east and south; and the insulated position of the mountainous tract confines the heavier mists and rains to that part of the county where their effects are least felt. The general inequality of the ground carries off surface waters and prevents damps, so that the climate, although somewhat cold, is considered very wholesome. The prevailing winds in spring are from the east: westerly winds, although more frequent than from any other point, have not so great a prevalence as in the neighbouring counties. Larch timber thrives on very exposed situations on the Mourne mountains.

The chief geological features are strongly marked. The Mourne and Slieve Croob groups consist of granite. The boundary of this primitive district begins from the east at Dundrum, whence passing northward to Slieve Croob, it runs nearly due west, including the lordship of Newry, and passes into the adjoining counties of Armagh and Louth. This mass of granite reappears in Cavan, and probably is the same which rises on the opposite side of the island in the mountains of Sligo. Northward and eastward of the granite district the whole of the remainder of the county is occupied by an extension of the transition series which forms the southern basin of Loch Neagh. Clay slate in greater or less degrees of induration is the prevalent rock. Towards the sea on the north-east and east slate quarries are common. On the Antrim boundary near Moira an extension of the tertiary limestone formation which occurs throughout the basaltic district occupies a small portion of this county, and affords a most valuable supply of lime manure to the north-western baronies. Limestone boulders are found along the eastern shore of the Bay of Belfast; and at Carthespil, near Comber, on the western side of Strangford loch, there is a quarry of reddish granular limestone. Great quantities of marl are raised in the neighbourhood of Downpatrick. The junction of the greywacke and granite may be observed along the eastern branch of the river Lagan, where it rises on Slieve Croob.

Copper ore has been found in the mountains about five miles north-east of Roastrevor; also near Portaferry, and at Clonliff, between Newtownards and Bangor. At the latter place is a lead-mine which has been worked with moderate success at various times. Lead ore occurs on the estate of Ballyleady, in the same neighbourhood, and on that of Bryansford, near Newcastle; also at Killough, and near Portaferry. A lead-mine has likewise been worked in the Blundel estate, half a mile from Dandrum. Indications of coal have been observed in the north-east of the county, and ochreous earths have been found in various places; but hitherto without leading to any practical result.

Chalybeate spas occur at Newry, Dromore, Magheralin, near Donaghadee and Rathfriland, and at various places in the barony of Ards. A chalybeate strongly impregnated with sulphur and nitre rises about two miles north-west of Ballynahinch, on the declivity of Slieve Croob mountain, which has been found very efficacious in scorbutic cases: the village of Ballynahinch has become a rather fashionable resort during the summer months in consequence.

The prevalent soil in the low district is a stony loam formed by the decomposition of the schistose rock. Clayey soils are confined to the north-east of the county and the barony of Ards, and are of a strong and productive quality, but they are wet and require a large quantity of manure. The richest soil in the county is in the district of Lecale, and a small tract of loam incumbent on limestone gravel in the neighbourhood of Moira and Magheralin: the timber here is of larger growth than elsewhere in Down. Alluvial tracts are frequent, and yield luxuriant crops of grass without manure. The bogs in general are not larger than is advantageous for purposes of turbary. Moory land is confined to the mountain district: the soil is here light and gravelly; but with proper cultivation, as in the vicinity of Newry and of Castlewellsan, can be made to yield good crops of oats and barley. Considerable quantities of wheat are raised throughout the county, but chiefly along both shores of Strangford Loch; oats and barley are the chief produce of the south and centre of the county. Numerous resident nobility and gentry set an example of the best modes of cultivation; and several farming societies encourage competition among the landowners by annual ploughing matches and cattle-shows. The contrast between the slovenly farming of Meath and the workmanlike manner in which the

land is fenced and laid down in this county strikes an observer travelling from Dublin to Belfast very forcibly. The system of green crops and stall feeding is now being pursued by most of the gentlemen-farmers; but has not yet become general among the ordinary landowners. Fences on the Antrim boundary and along the line of the Dublin road are of quickthorn; clay banks and dry stone walls are most common in the other parts of the county.

Large quantities of sea-weed are used as manure along the north-east and eastern coast. The distance of limestone quarries renders lime manure very expensive throughout the central baronies; but in the south and south-east there is an abundant supply of marl in the barony of Lecale. This valuable substance is found in morasses and alluvial tracts at the bottoms of hills, and consists entirely of marine exuviae: the bed of marl is sometimes five feet in thickness. It was first brought into use in 1707, before which time the neighbouring country was only moderately fertile in oats and barley: but with a judicious use of this manure it now yields excellent crops of wheat. The immediate advance on the value of land which followed its introduction was four-fold, and a corn trade was opened from Strangford in consequence. The eagerness, however, with which this manure was applied led to the bad consequences which always attend strong manuring and over cropping; and it is said that so late as 1804 some of these lands had not yet recovered. The annual agricultural produce of Down has been valued at 1,396,000*l.*; the rental of proprietors at 172,329*l.* per annum, and the rent to occupiers of land, at 22*s.* per acre.

The following table exhibits the quantities of wheat, &c., sold at the principal grain markets of Down in the years 1834-5. The market of Newry is supplied from Armagh and other counties, as well as from Down; and large quantities of the produce of Down are disposed of at Belfast.

| | Wheat. tons. | Oats. tons. | Barley. tons. | Rye. tons. | Bere. tons. | Whether general grain market increasing or de- creasing. |
|--------------|-----------------|----------------|------------------|---------------|----------------|---|
| Downpatrick | 3,200 | 380 | 2,400 | 209 | 450 | Increasing. |
| Portaferry | 1,600 | 244 | 1,600 | ... | ... | ditto |
| Strangford | 570 | 193 | 800 | ... | ... | Decreasing. |
| Ardglass | 400 | 390 | 400 | ... | ... | ditto |
| Killough | 1,600 | 200 | 1,000 | ... | ... | Increasing. |
| Ballynahinch | 3 | 1,700 | 7 | 4 | ... | Decreasing. |
| Killileagh | 1,900 | 300 | 140 | ... | ... | Increasing. |
| Banbridge | 1,230 | ... | ... | ... | ... | ditto |
| Moira | 214 | 90 | ... | ... | ... | Decreasing. |
| Dromore | ... | ... | ... | ... | ... | No return for 1835. |
| Newtownards | 1,000 | 700 | 800 | ... | ... | Increasing. |
| Newry | 7,710 | 23,850 | 3,610 | ... | ... | ditto |

Down is not a grazing county, nor are there any sheep farms; but great numbers of pigs are reared for the provision markets of Newry and Belfast. The general condition of the people is much superior to that of the peasantry of the southern counties. Wages of labourers are 10*d.* per day in winter, and 1*s.* during the rest of the year: the average number of days' work obtained in agriculture each year is 160. The resident nobility and gentry are more numerous in proportion to the extent of the county than in any other part of Ulster. Among the principal may be mentioned the marquises of Downshire and Donegal, and during a part of each year the marquis of Londonderry and Lord Clanwilliam, the earl of Roden, Earl Annesley, Lord Dufferin and Claneboey, Lord Bangor, Sir Robert Bateson, Mr. Ker, Colonel Forde, Mr. Sharman Crawford, &c., with incomes varying from 8000*l.* to 60,000*l.* per annum. The yeomanry of the county are an intelligent class. Blue cloth is the usual dress of the better class of the peasantry, and the loose frieze coat so common in Louth and the borders of Armagh is rarely seen here. The provisions of the lighting and paving act have been put in force in Newry and Downpatrick, and Banbridge, and are about being extended to Dromore.

Down contains seven baronies, and part of the lordship of Newry; the remainder of this division lying in Armagh. The baronies are—Ards, on the east and north-east, between Loch Strangford and the sea, containing part of the town of Newtownards, total population (in 1831) 4442; and the towns of Portaferry, population 2203; Bangor, population 2741; Donaghadee, population 2986; Ballywalter, population 664; and Kirkcubbin, population 537; Castlereagh, on the north-east and north, between Loch Strangford and the county of Antrim, containing the towns of Ballymacarratt (the eastern suburb of Belfast), population 5168;

Comber, population 1377; Holywood, population 1288; and Saintfield, population 1053. Dufferin, on the western shore of Loch Strangford, contains the town of Killileagh, population 1147. Iveagh, Lower, on the north and north-west towards Antrim, and Loch Neagh, containing the towns of Hillsborough, population 1453; Dromore, population 1942; and Moira, population 787. Iveagh, Upper, on the west and midland, containing the towns of Banbridge, population 2469; Rathfriland, population 2001; Loughbrickland, population 618; Warrenspoint, population 1856; Roastrevor, population 996; and Castlewellan, population 729. Kinalcarty, midland, between Upper Iveagh and Dufferin, containing the town of Ballynahinch, population 970. Lecale, on the south-east, between Strangford Loch and Dundrum bay, containing the borough of Downpatrick, population 4784; and the towns of Ardglass, population 1162; Killough, population 1162; and Strangford, population 583; Mourne, lying between Dundrum bay and Carlingford Loch, containing the town of Kilkeel, population 1039; and part of the lordship of Newry, containing part of the borough of Newry, the total population of which is 13,065.

Down returns four members to the imperial parliament, viz., two for the county, one for the borough of Newry, and one for the borough of Downpatrick. Besides these boroughs, Newtownards, Bangor, Killileagh, and Hillsborough returned members to the Irish parliament, and are still corporate towns. The lordship of Newry, the greater part of which lies within this county, is subject to a peculiar ecclesiastical jurisdiction exercised by the family of Needham as representatives of Sir Nicholas Bagnall, to whom, after the dissolution of religious houses in Ireland, the abbey of Newry with all its immunities and privileges was granted in fee by Edward VI. The manor of Mourne formed a portion of the original grant, and passed by marriage to the family of Paget, who claim the same ecclesiastical immunities for it in the diocese of Down as the Needham family for their portion in the diocese of Dromore, but hitherto without success. The authority of the representatives of the late Lord Kilmorey in his lordship of Newry extends to the presentation to livings, the granting of marriage licenses, probates, &c., in their ecclesiastical capacity, and to the holding of courts baron and leet, and discharging all recognizances to the Crown forfeited within that jurisdiction, in their civil capacity.

The linen manufacture is the staple trade of Down, and gives employment to a greater number of operatives, in proportion to the population, than in any other part of Ireland. In 1831 the number of linen weavers was 6711; and of weavers of damask, 6: the number of wheelwrights (makers of wheels for spinning linen yarn by hand) was 142; and of those employed in making other machinery for the manufacture of linens, millwrights, reed-makers, shuttle-makers, &c., 2207; together with 34 engaged in making machinery for drapers, and 32 for damasks; all exclusive of female hand-spinners throughout the county; so that the entire number to whom the trade gives occupation may be safely stated at 10,000. The linen manufacture has been long carried on in Ireland, but its first great impulse was in consequence of the settlement of French refugees on the revocation of the edict of Nantes, who, by introducing the improved machinery of the continent, and setting an example of more business-like habits, raised the manufacture to a high degree of perfection and importance. To M. Crommelin, who settled at Lisburn in the reign of William III., Down owes the introduction of the improved manufacture on an extensive scale: before his time no web finer than of the quality called 'a fourteen-hundred' had been made in Ireland. This enterprising individual imported a thousand looms from Holland, and gave the manufacture such importance as secured it the attention and patronage of government. In the 4th of Queen Anne the export duty on Irish linens was taken off, and from that time the trade has continued to flourish.

The importation of flax-seed employs a considerable capital in Belfast and Newry. It is generally thought necessary to renew the seed from year to year; but a few farmers have latterly saved their own seed, and the practice has so far proved successful. The dressing of the grown crop gives employment to numerous scutchers and hacklers throughout the county; but the introduction of linen spinning machinery has materially lessened the demand for hand labour in converting the dressed flax into thread. Manufacturers,

however, prefer hand-spun thread for the west, and the demand is still sufficient to give occupation to numerous females, who, except at the times of harvest, haymaking, and raising the potato crop, can make from 3d. to 4d. per day, besides attending to their ordinary rural concerns. Weaving is mostly carried on in the houses of small farmers, and there are few weavers who do not give part of their time to agriculture; hence they are generally a healthy and long-lived class of men. Hand-spinning and weaving are not confined to any particular district. When the webs are ready for the bleacher, they are carried to market. The following table, drawn up in 1802, exhibits the quality of cloth manufactured in the district surrounding each town. It is difficult to ascertain the quantity made in the county at large, as the markets of Lurgan, Lisburn, and Belfast, are in a great measure supplied from the northern parts of Down, and it not unfrequently happens that what is sold in one market is resold in another.

| Linen Markets in Down. | Quality of Linens sold in each |
|----------------------------|--------------------------------|
| Newry | from 8 to 14 hundreds; |
| " a few | up to 16 ditto |
| Rathfriland | from 8 to 14 ditto. |
| Kilkeel | " 8 to 10 ditto. |
| Downpatrick | " 8 to 16 ditto. |
| Castlewellan | " 8 to 9 ditto. |
| Ballynahinch | " 8 to 18 ditto. |
| Banbridge | " 8 to 15 ditto. |
| Dromore | " 10 to 20 ditto. |
| Hillsborough | " 6 to 20 ditto. |
| Portaferry and } | " 10 to 14 ditto.* |
| Kirkcubbin } | |

The next process, and that which employs nearly an equal number of hands, is the bleaching and preparing for market the green web as purchased from the weaver. The chief manufacturing district of this county, as of Ireland at large, is along the valley of the Upper Bann. The waters of this river are peculiarly efficacious in bleaching; and its rapid descent affords numerous sites for the machinery employed. From Tanderagie in Armagh, to five miles above Banbridge in Down, the banks of this river present an almost continuous succession of bleaching greens. On that part of the river which flows through Down there are eighteen of these establishments, each covering a large tract of ground, and giving employment to a numerous rural population. Besides these establishments, there are upon the Bann several extensive flour mills, a vitriol manufactory, and two factories for spinning linen thread by machinery. The waste of these bleach greens is found highly valuable as a manure. The neighbourhood of Guilford and Moyallan, about half way between Banbridge and Tanderagie, is celebrated for its rural beauty. Orchards are attached to all the better class of cottages, and the vicinity of so many bleach greens gives the effect of a continuous tract of rich park scenery on each bank of the river. The proprietors of the majority of these establishments are Dissenters and members of the Society of Friends, and the population generally is Protestant.

The cotton and muslin manufacture in 1831 gave occupation to 3278 individuals: of these 307 were muslin weavers, and 13 were weavers of corduroy. The principal market for muslin fabrics is Belfast. This trade is not on the increase. The leather manufacture is carried on pretty briskly in Newry and in various parts of the county. The number of operatives employed in both in 1831 was 89. There is an extensive iron foundry near Ballymacarratt, which supplies much of the machinery used in the factories of Belfast. Here also are salt and vitriol works, with a manufacture of coarse glass. The manufacture of kelp is carried on to some extent on the shores of Loch Strangford.

The exports and imports of Down are made almost entirely through the ports of Belfast and Newry. The net receipts of customs' duty at Newry in 1836 was 43,867. About 80,000 firkins of butter are exported yearly from Down, and this as well as all other exports is increasing.

The fishery on the coast from Bangor to Carlingford bay is pursued with a good deal of industry, but hitherto without sufficient capital or skill. The herring fishery com-

* The linens being one yard wide, are distinguished by the number of threads contained in that breadth; thus an eight hundred web is one whose warp contains that number of threads of yarn.

mences in July, and is pursued throughout the autumn and beginning of winter. The principal fishing ground lies off Lecale, at a distance of a quarter of a mile to two leagues from shore, in three to seventeen fathom water, and extends with little interruption from Newcastle on the south to the entrance to Strangford Loch upon the north. The fish taken are herrings, mackarel, haddock, cod, ling, glassan, bream, pollock, gurnet, plaice, bait, and turbot. Besides this there are several other fishing grounds off the coasts of Mourne and Ards.

The following table exhibits the number of boats and men employed in the fishery in 1835 at each of the coast-guard stations as below :—

| STATION. | Decked Vessels. | | | Half-decked Vessels. | | | Open sail boats. | | Row-bts. | | No. of Fishermen. |
|----------------------------------|-----------------|---------|-----------|----------------------|---------|-----------|------------------|-----------|----------|------|-------------------|

Upwards of 300 boats frequent Ardglass harbour during the fishing season. Of those about one-third are from England, one-third from the Isle of Man, and one-third from

Arklow, Skerries, and other places on the Irish coast. This concourse of fishermen causes a considerable trade in Ardglass. Three additional butchers have booths here for the sale of meat during the season. The English and Man boats are larger and better found than the Irish. Their tackle and gear also are of a superior description; and although so many inhabitants of the coast appear by the above table to be engaged in the pursuit, it is a remarkable fact that neither at Newry, Downpatrick, nor Belfast, is there a sufficient supply of fish, and that the salt herrings consumed throughout the county are invariably of Scotch curing. There is ample occupation for five times the number of men at present engaged in the fishing off this coast.

The county assizes are held twice a year at Downpatrick. Quarter sessions are held by the assistant barrister twice a year at Downpatrick, Newry, Dromore, and Newtownards. The constabulary force stationed in Down in the year 1835 consisted of 5 chief constables, 30 constables, 114 sub-constables, and 6 horses; and the expense of their support was 6,884*l.* 6*s.*, of which 3,297*l.* 10*s.* 8*d.* was chargeable against the county.

Before and for some time after the coming of the English, Down was known as Ulladh or Ulidia, the original of the name of Ulster. The ancient inhabitants are supposed to have been the Voluntii of Ptolemy. The north-eastern portion of Down was at an early period occupied by the Picts, of whom there was a considerable colony so late as the 6th and 7th centuries, extending from Strangford Loch to the Lower Bann in Antrim. Whether these Picts, who are called *Cruithne* by the annalists, were of a nation essentially different from the bulk of the Celtic inhabitants of Ireland is still under discussion: the region occupied by them abounds with stone-circles, cromlechs, and subterranean galleries, which usually mark the presence of this peculiar people. The territory occupied by them was called Dalaradia, and extended from the Ravil river in Antrim over the southern part of that county and the north and north-east of Down.

| Date. | How ascertained. | Houses. | Families. | Families chiefly employed in agriculture. | Families chiefly employed in trade, manufactures, and handicraft. | All other families not comprised in the two preceding classes. | Males. | Females. | Total. |

The presence of St. Patrick in this county in the sixth century is attested by authentic records, and can be traced with topographical exactness at the present day. Downpatrick, Saul, Dromore, Moville, and Bangor, are the chief ecclesiastical foundations of Patrick and his immediate successors. Of these the last was the most famous, having a college, which for many years rivalled the schools of Armagh and Lismore. The foundation of the abbey of Newry for Cistercian monks, by Maurice Mac Loughlin, king of Ireland, in 1163, is the most interesting event connected with Down prior to the English invasion, as the charter is still extant (O'Connor's *Rer. Hib. Scrip. Vet. Proleg.* ii., 153), witnessed by the celebrated primate Gelasius and by the petty kings of most of the northern provinces. The lands are conveyed with their woods, waters, and mills.

Down was overrun by the English under John de Courcy in 1177. The chief families introduced by the conquest were the Savages, Whites, Riddles, Sendalls, Poers, Chamberlains, Stokes, Mandevilles, Jordans, Stauntons, Logans, Papelaws, Russels, Audleys, Copelands, Martells. Of these the Savages, Whites, and Russels still remain: most of the other names have become extinct in consequence of subsequent conquests by the Irish, and forfeiture. The county was originally divided into two shires, Down, and Newtown or the Ards, to which sheriffs were regularly appointed until 1333, when the revolt of the Irish on the murder of William de Burgho [Belfast] overturned the English authority throughout Ulster. The family of Savage, who had possessed the baronies of Ards and Castlereagh, were driven into the peninsula between Loch Strangford and the sea,

and the Whites, who had held the centre of the county, were confined to that part of Dufferin which borders on Loch Strangford on the west. Castlereagh fell into the hands of the O'Neills; Kinelearty into those of the Mac Artanes; and Mac Rory and Magennis obtained the whole of Upper and Lower Iveagh. Lecale and Mourne, being protected until the middle of the seventeenth century by the castles of Ardglass, Dundrum, and Green Castle, held out against the natives, and having a sea communication with Louth, were considered as part of that county, while the rest of Down remained without the pale.

The Whites and Savages being separated from the English fell soon after into Irish habits, but still maintained an independence among the hostile tribes around them. Ardquin in Upper Ards, and Killileagh on the shore of Loch Strangford, were their respective places of defence. The attainer of Shane O'Neill, who was slain in rebellion in 1567, threw all Iveagh, Kinelearty, Castlereagh, and Lower Ards into the hands of the Crown. The dissolution of religious houses had already enabled the government to place an English colony at Newry, which had been granted to the family of Bagnall, and an attempt was made in 1572 to occupy the Ards and Castlereagh with a similar force under the family of Smith: but the son of Sir Thomas Smith, who led the expedition, being killed by Neal Mac Brian Artagh, one of the attainted O'Neills, the project miscarried. Some indulgence was now shown to the O'Neills, Magennis, and Mac Artanes, who upon submission acquired grants of their estates. In 1602, however, O'Neill of Castlereagh being seized on some slight pretext, and imprisoned in Car-

rickfergus Castle, contrived to make his escape by the assistance of one Montgomery, the brother of a Scotch knight of some fortune, who afforded the fugitive protection on his arrival in Scotland, and afterwards negotiated his pardon on the terms of having the greater part of O'Neill's estate made over to himself and Mr. Hamilton, his associate in the proceeding. The colony led over by Sir Hugh Montgomery settled chiefly about Newtownards and Greyabbey, along the north-eastern coast between Strangford Loch and the sea, and by their enterprize and industry soon raised that part of the county to a very flourishing condition. The general plantation of Ulster soon after gave security to their improvements. Sir Hugh was raised to the rank of viscount; and his colony proved of the greatest service during the subsequent wars which commenced with the rebellion of 1641. The family of Hamilton settled at Bangor and Killileagh. That of Hill, which about the same time acquired large estates in the north of the county, settled in the neighbourhood of Belfast, and soon after their arrival laid the commencement of a town at Hillsborough, the residence of their present representative, the marquis of Downshire. The forfeitures consequent on the rebellion of 1641 and the war of the revolution deprived almost all the old Irish and Anglo-Norman families of their estates. Magennis, Lord Iveagh, was the chief sufferer by the first; the Whites, Russels and Savages, were the principal families affected by the latter. At present the fee of the county is almost entirely in the hands of Protestant proprietors of English and Scotch descent.

Of the Pagan antiquities of Down, the most remarkable is a stone cromlech, inclosed by a circular ditch of extraordinary dimensions, called the Giant's Ring, near Shaw's Bridge, half way between Lisburn and Belfast. The inclosure is nearly half an English mile in circumference; and the rampart is still from 12 to 14 feet in height. There are stone monuments of the same character at Sliddeny Ford, near Dundrum, and Legaraney in the parish of Drumgoolan. There is a remarkable cairn, or sepulchral pile of stones, on the top of Slieve Croob. The main pile is 77 yards in circumference at bottom, 45 yards at top, and 54 feet high at its greatest elevation: there are twenty-two smaller cairns raised on the top. Along the Armagh boundary of Down there extends a great earthen rampart, called by the people of the country the Danes' Cast, and sometimes Tyrone's ditches. The native Irish call it *Glin na maic duibh*, or the Glen of the Black Pig, which is the name applied by the lowland Scotch to the wall of Antoninus. The Danes' Cast measures from 80 to 50 feet across, and occurs at intervals along the line of the Newry canal from the lands of Lisnagade, where it commences, near Scarvagh in Down, to the neighbourhood of Forkhill in the county of Armagh, west of which it has been traced to a great distance by the officers of the Ordnance Survey. Its origin is quite unknown. There are numerous raths or earthen entrenched mounds throughout Down, of which the most remarkable are at Downpatrick, Donaghadee and Dromore. Of the Anglo-Norman military antiquities of Down, the castle of Dundrum is the most important. It is imposingly situated on a rock over the bay, and consists of a circular keep with numerous outworks. It is said to have been built by De Courcy for the knights templars, who occupied it till the suppression of that order in 1313, when it was granted to the prior of Down. In 1517 it was taken from the Irish, who had seized it some time before, by Gerald earl of Kildare; and again in 1538 by the Lord Deputy Grey, with seven other castles in Lecale. It afterwards got into the hands of the Magennises, who held it for Shane O'Neill, who is said to have usually kept 200 tons of wine in his cellars here. In 1601 it was taken from Ever Magenn's by the lord deputy Mountjoy, and was finally dismantled by order of Cromwell during the progress of the war of 1641. It is now the property of the marquis of Downshire, as representative of Lord Blundell, to whom it came through the earl of Ardglass after its forfeiture by the Magennises. Green Castle in Mourne was a place of great importance in the early history of Ulster. In 1495 it was deemed so important a post, that none but an Englishman was permitted to be warden. The castle of New-castle was built by Felix Magennis in 1588, and is still inhabited. The Magennises had castles also at Castleweilan and Rathfriland. There are extensive military remains at Ardglass, and the castles of Killileagh, Ardquin, Portaferry, Bangor, and Hillsborough, are the most important of those

still standing. There are also some remains of the fortifications erected by General Monk for the defence of the passes into Armagh at Scarvagh, Poyntz, and Tuscan passes.

The chief ecclesiastical remains in Down are at Downpatrick, where there are the ruins of the cathedral, and of three other religious houses. The cathedral was 100 feet in length; the roof of the centre aisle was supported by five arches of fine proportions. Prior to 1790, a round tower 66 feet in height stood at the western end: it was taken down at the time of the partial rebuilding of the cathedral; and it is worthy of remark, that part of the wall of some more antient edifice was found to run below its foundations. There is another round tower at Drumbo, near Belfast. There are a few remains of the abbey of Bangor; and at Greyabbey there is still standing in good preservation a part of the antient abbey founded here in 1192 by Africa, daughter of the king of Man, and wife of De Courcy.

A mile and a half to the east of Downpatrick is a hill about 150 feet high, called Strual mountain, celebrated all over Ireland for the resort of the lower orders of Roman Catholics, who come here every Midsummer for the performance of penance. The ceremonies commence by the penitents climbing Strua. mountain on their knees, with a large stone placed on the back of the neck, three, seven, or nine times, according to the circumstances of the case: after this they are turned thrice round in a stone seat called St. Patrick's chair, by a person who in 1830 used to come annually from the county of Mayo for the purpose of presiding over this part of the ceremony. The penitents then descend to a neighbouring plain, where they bathe promiscuously in a well dedicated to St. Patrick, and conclude by drinking from another well. Tents are erected in the adjacent fields, and the evening is generally spent in dissipation.

Education has made rapid progress since 1821; in that year the number of young persons receiving instruction was 9521; in 1824 it was 14,111; and in 1834 the number of young persons receiving daily instruction, in the two dioceses of Down and Dromore, which are together very nearly co-extensive with the county, was 36,446. These dioceses stand respectively fourth and twelfth in educational rank among the thirty-two dioceses of Ireland. According to Mr. D'Alton's return of funds designed for educational purposes in Ireland, the annual amount so designed in Down is 1092*l.* 2*s.* 8*d.*; the acreable possessions of the different schools is seventy-one acres, and the amount contributed by the National Board of Education is 645*l.* per annum.

County expenses are defrayed by grand jury presentments: average amount so levied during the twenty years preceding 1830, 31,000*l.* Down pays 13,817*l.* 9*s.* 6*d.* as share of the original expense of the district lunatic asylum at Belfast, and a share of the annual expense proportioned to its population. Two newspapers are supported at Newry: the number of stamps issued to these in 1831 was 122,600; and in 1836 the number was 121,961. The gross produce of customs' duties collected within the Newry and Strangford district in the year 1835 was 53,902*l.* 4*s.* 7*d.*

(Harris's *History of Down*, Dublin, 1744; *Statistical Survey of Down*, Dublin, 1802; *Ingles's Ireland in 1834*; *Report on Irish Fisheries*, 1837; *Reports on Education in Ireland*, 1837; *Cox's History of Ireland*.)

DOWN, a bishop's see in the ecclesiastical province of Armagh in Ireland. The chapter, which is regulated by patent of James I., consists of dean, precentor, chancellor, archdeacon, and two prebendaries. With the exception of part of one parish lying in Antrim, this diocese is situated entirely in the county of Down, of which it occupies the eastern portion. It extends in length from south-west to north-east 51 English miles, by 28 miles in breadth from east to west. It contains 42 parishes, constituting 37 benefices. In 1792 the number of churches was 33; and in 1834 the numbers were, churches of the establishment 40, Roman Catholic 37, Presbyterian 56, other places of worship 19. In the same year the gross population of the diocese was 188,558, of whom there were 27,662 members of the established church, 58,405 Roman Catholics, 98,961 Presbyterians, and 3,530 other Protestant Dissenters, being in the proportion of rather more than two Protestants of whatever denomination to one Roman Catholic. There were at the same time in this diocese 309 daily schools, educating 19,459 young persons, being in the proportion of 10.26 per cent. of the entire population under daily instruction, in which respect Down stands fourth among the 32 dioceses

of Ireland. Of the above schools 46 were in connection with the National Board of Education.

The see of Down was founded about the end of the fifth century by St. Patrick, who appointed Cailin, abbot of Antrim, to the bishopric. The first episcopal seat was at Downpatrick, then called Aras Keltair and Rath Keltair, where it continued until after the plantation of Ulster in the reign of James I., when the church of Lisburn was by letters patent constituted the cathedral of the united diocese of Down and Connor; but the original episcopal seat was restored to Downpatrick by act of parliament about 1790. The most distinguished bishop of Down, prior to the English invasion, was Malachy O'Morgair, who succeeded in 1137, and assisted the Primate Gelasius in the introduction of the Roman discipline. In 1442, the union of Down with the see of Connor took place in the person of John first bishop of the united diocese. Among his successors, those of most note were, Leslie, bishop during the wars of 1641, and the celebrated Doctor Jeremy Taylor, who succeeded in 1660. From 1441 down to the end of the last century there has been no episcopal residence attached to this see. Doctor Taylor generally resided at Portmore, near Glenavy, in the county of Antrim. The present episcopal mansion stands within a mile of Holywood, on the eastern shore of Belfast Loch. The same ecclesiastical immunities are claimed by the Paget family for their manor of Mourne in this diocese as by the Needham family for their Lordship of Newry [Down] in the diocese of Dromore; but this claim has always been resisted by the bishops of Down. By act 3rd and 4th William IV. c. 37, the united diocese of Down and Connor is further augmented by the diocese of Dromore.

(Beaufort's *Memoir of a Map of Ireland*; Ware's *Bishops' Reports of Commissioners*, &c.)

DOWNING COLLEGE, CAMBRIDGE. The sole founder of this college was Sir George Downing, Bart., of Gamlingay Park, in Cambridgeshire, who by will dated 20th December, 1717, devised estates in the counties of Cambridge, Bedford, and Suffolk, first to Sir Jacob Gerard Downing, and afterwards to other relations in succession, and in failure thereof, to build and found a college in this university, upon a plan to be approved of by the two archbishops and the masters of St. John's and Clare Hall. This direction was the reason for giving them the power which they possess in elections and other matters by the charter and statutes.

Sir George died in 1749 and Sir Jacob in 1764, and (the other devisees having previously died without issue) upon this event the foundation ought to have been immediately carried into execution. But the estates were in the possession of Lady Downing, and afterwards of her devisees, without any real title; and when the university sued in chancery for the establishment of the college, the party in possession resisted the suit in that court. In 1769 a decree was obtained in favour of the foundation.

The persons named as trustees in the founder's will having died in his lifetime, the execution of the trusts devolved upon the heirs-at-law; who, after combating a long series of opposition and litigation, and overcoming obstacles of various descriptions, preferred a petition to the crown for a charter; and at length, in 1800, the privy council decided to recommend the foundation to his majesty.

On 2nd September, 1800, the great seal was affixed to the charter by Lord Loughborough: by this charter the college is incorporated with all the privileges belonging to any college in the university, and endowed with the estate devised by the founder, with a power to hold landed property (in addition thereto) to the value of 1500*l.* per annum.

The charter directs statutes to be framed for the government of the college, which was done in July, 1805, and shortly afterwards the stipends of the members began to be paid. By the statutes, no beneficial leases of the college estates are allowed, nor any fine to be taken for a grant or renewal. It is also provided that no new foundation shall ever be engrafted on this college which shall be inconsistent with the charter and statutes. But the college may accept any additions to their property in augmentation of the number or value of their present appointments, or to be applied in any other manner consistent with their present constitution. There is also a power given to the four electors and the master to alter the statutes, on application by a certain portion of the college.

A piece of land, nearly thirty acres, having been purchased for the site, and for grounds and walks, on the 18th May, 1807, the first stone was laid; since which time the building has proceeded at intervals, at the expense of above 60,000*l.* In 1821 buildings sufficient for opening the college, and comprizing nearly two sides of a large court, were completed; and in May, 1821, undergraduates were admitted to reside and keep terms.

This college will consist of a master, two professors (one of the laws of England and one of medicine), sixteen fellows (two of which only are clerical), and six scholars. The objects of the foundation are stated in the charter to be students in law, physic, and other useful arts and learning. At present only the master, professors, and three fellows, are appointed, for the purpose of taking possession of the estates, administering the revenues, superintending the building of the college, and for the other necessary purposes. The appointment of the remaining fellows is reserved until after the erection of the buildings necessary for the college. The scholars will also be elected after that period; but not more than two in each year. There are also two chaplains nominated by the master.

The master is elected by the archbishops of Canterbury and York, and the masters of St. John's and Clare Hall, from among those who have been professors or fellows. The electors to professorships are the same as to the mastership, with the addition of the master. The electors to the fellowships are, the master, professors, and fellows of the degree of M.A. After the building of the college is completed, the elections will be annually on the 21st of February. While the college remains uncompleted, the elections to fellowships are at uncertain times, depending upon vacancies. The clerical fellowships are to be tenable for life: the lay fellowships to continue only for twelve years. The present master is the Rev. Thomas Worsley, M.A., elected 1836; and the number of members upon the boards of the college forty-nine. The rectory of East Hartly, and the vicarage of Tadlow, both in the county of Cambridge, are in the patronage of this college.

(Ackermann's *Hist. of the Univ. of Cambridge*, 4to, Lond. 1815, vol. ii. p. 283—288; *Cambridge Univ. Calendar* for 1837.)

DOWNPATRICK, the assize town of the county of Down, in Ireland, distant from Dublin 73 Irish or 93 English miles; situated in the barony of Lecale, one mile to the south of the Quoil river, which opens into the south-western angle of Strangford Loch about four miles to the east. Downpatrick is the seat of a bishopric, and returns a member to the imperial parliament. Constituency, 525.

The boundaries of the borough embrace an extent of 1486 statute acres, containing 897 houses, of which 237 are thatched and 660 are slated: of the latter 285 are estimated to be worth 10*l.* per annum.

Downpatrick takes its name from St. Patrick, who is stated in many antient records to have been buried here. Before his time the place was called Rath Keltair and Dun-da-leth-glass, from an earthen fortification, the ruins of which still cover a considerable space, and present an imposing appearance on the north-west of the town. On the conquest of Ulster by the English in 1177, De Courcy made Downpatrick his head-quarters, and it continued in the hands of the English until about the time of the rebellion of Shane O'Neill, in 1567, when it fell into the hands of the Irish, but was retaken by Sir Richard Morrison soon after.

The town is pleasantly situated in a rich, undulating country, surrounded by hills. There is a good court-house, a ruined cathedral, one church, two Roman Catholic do., a Presbyterian meeting-house, a Methodist do., and a good market-house and gaol. An hospital was founded here about 1740, by Mr. Southwell, for the reception of decayed tenants. The provisions of the Paving and Lighting Act were put in force here in 1829, since which time the town has been lighted with oil: expense, about 360*l.* per annum.

There are branches of the northern banking company and of the provincial bank of Ireland at Downpatrick.

There are ten schools with small endowments within the deanery; a diocesan school, to which the bishop and clergy subscribe 90*l.* per annum; and a gaol school supported by the county; besides a male and female school, supported by Lady Harriet Forde, and twenty-four other schools: total number of young persons under instruction, 897 males and 462 females.

Population in 1821, 4123; in 1831, 4784. [Down.]

DOWNs or DUNES, are little hillocks of sand formed along the sea-coast.

The mode of their formation is this:—the waves of the sea, in certain localities, drive upon the beach a certain quantity of fine sand, which, becoming dry during low water, is carried up still higher by the wind, till meeting with the obstruction of large stones, bushes, tufts of grass, &c., it is accumulated into little heaps: these offering still greater surface of resistance as the sand increases upon and against them, soon rise into mounds of considerable height, whose number, arrangement, and dimensions, depend naturally upon the size and distribution of the obstacles to which they owe their existence. If these obstacles are close-set, there will be little more than one range of sand hillocks, and, if very close, these will in time unite so as to form a continuous ridge. Should the arresting objects, on the contrary, be thinly scattered, and at different distances from the brink on a shelving coast, there will be several ridges of hillocks, the one behind the other.

The downs having attained a certain height, the wind has no longer the power to increase their elevation, and they are then urged forward upon the land.

The way in which this is effected is easily conceived. On the windward side of the hillocks the grains of sand are forced up to the top, whence they are swept off as they arrive, and fall by their own weight on the opposite slope. Thus the mass goes on invading the land, while fresh material is constantly brought by the sea.

This progress inland depends however upon the habitual direction of the wind and the relative direction of the coast-line. In Gascony the sand advances eastward, and generally along the whole coast of France, from Bayonne to Calais, the downs progress in a north-easterly direction, the wind blowing most frequently from the south-west; whereas from Calais to Dunkerque, the coast trending in the direction of the wind, they make no progress inland, but form a ridge or chain parallel with the coast.

The rapidity with which the sands advance is, in some cases, most alarming. Between the mouths of the Adour and the Garonne their progress is about sixty feet yearly; nor is it easy to arrest their march. The town of Mimizan is in part buried under the sands, against whose encroachment it has been struggling for the last five-and-twenty years. In Brittany also, a village near St. Pol de Leon has been entirely covered with the sand, so as to leave no part visible but the steeple of the church.

In the Boulonnais the advance of the downs has been almost wholly arrested since the works there executed by Cassini. The inhabitants plant a species of cyperacea (the *Arundo arenaria*), termed by them *oya*, which thrives well, and fixes the sands. This process is so much the more advantageous, as every hillock which becomes fixed is an effectual barrier against the invasion of fresh sand from the sea.

In Gascony the peasants force the wind, in some measure, to drive back what it brought. Thus, when the wind blows in a direction contrary to that which pushes the downs upon the land, they toss the sand high into the air with shovels, and in this manner get rid of a portion of it: this portion, however, is very small, and the prevailing winds being from the south-west the sands continue to advance in spite of all their efforts.

Downs sometimes intercept the flow of water to the sea, forming stagnant pools between and behind them which give rise to an aquatic vegetation and the occasional formation of a kind of peat.

DOWNTON. [WILTSHIRE.]

DOXOLOGY, a form of giving glory to God, from the Latin *doxologia*, and that from the Greek *doxa* (δόξα), glory, and *logos* (λόγος), a word or saying. The doxology in the concluding paragraph of the Lord's Prayer, 'Thine is the kingdom, and the power, and the glory,' is left out of many of the ancient copies of St. Matthew's Gospel, though it appears in others; St. Luke omits it entirely. The authenticity of this form of praise, as a paragraph of the prayer, has been a difficult subject of dispute. It does not appear in the Vulgate, but it seems to be established by the Greek MSS. and the Eastern versions. Doxology is also used for the short hymn, *Gloria Patri*, which we use in our church service at the end of every psalm, of every part of the hundred and nineteenth psalm, and of every hymn except *Te Deum*, which is a doxology of itself. Durand

and other writers consider this exception to have been introduced into the Romish church by St. Jerome. The first express mention of it is in the second council of Vaison, A. D. 529. Amongst the Christians it was always considered as a solemn profession of their belief in the Trinity. (Wheatly on the *Common Prayer*, 8vo. Oxf. 1802, pp. 124. 132. Broughton's *Dict. of all Religions*, pp. 341, 342.)

DRACÆNA, a genus of endogenous plants, of the natural family Asparagaceæ of Jussieu, now arranged as a section of Liliaceæ by Dr. Lindley. The genus was established by Linnaeus, and named from one of its species yielding the resinous exudation, familiarly known by the name of Dragon's blood, a translation of the Arabic name *dum al akh-wair*, met with in Avicenna and other Arabian authors. Dracæna is characterized by having an inferior six-partite perianth, of which the segments are nearly erect, and have inserted on them the six stamens, with filaments thickened towards the middle and linear anthers. The style is single, with a trifid stigma. The berry two or three-celled, with its cells one or two-seeded.

The species of Dracæna are now about 30 in number, and found in the warm parts of the Old World, and in many of both Asiatic and African islands, whence they extend southwards to the Cape of Good Hope and New Holland, and northwards into China, and to the eastern parts of India, as the districts of Silhet and Chittagong. Species are also found in Socotra, and the Canary and Cape Verd Islands, as well as at Sierra Leone. From this distribution it is evident that the species require artificial heat for their cultivation in England. They are found to thrive in a light loam, and may be grown from cuttings sunk in a bark bed.

The species of Dracæna are evergreens, either of a shrubby or arboreous nature; and having long, slender, often columnar stems, they emulate palms in habit. Their trunks are marked with the cicatrices of fallen leaves; the centre is soft and cellular, having externally a circle of stringy fibres. The leaves are simple, usually crowded together towards the end of the branches, or terminal like the inflorescence: whence we might suppose that the name *terminalis* had been applied to some of the species, if Rumphius had not stated that it was in consequence of their being planted along the boundaries of fields. The structure of the stem and leaves is particularly interesting, as the fossil genera *Clathraria* and *Sternbergia* have been assimilated to Dracæna, the former by M. Adolphe Brongniart, and the latter by Dr. Lindley; and as Rumphius compares the leaves of a Dracæna with those of Galanga, it is as probable that the fossil leaves called *Cannophyllites* may be those of a plant allied to Dracæna, as that they belong to one of the Cannæ.

Of the several species of Dracæna which have been described by botanists, there are few which are of much importance either for their useful or ornamental properties. Among them, however, may be mentioned *D. terminalis*, a species rather extensively diffused. The root is said by Rumphius to be employed as a demulcent in cases of diarrhoea, and the plant as a signal of truth and of peace in the Eastern archipelago. In the Islands of the Pacific Ocean a sweetish juice is expressed from its roots, and afterwards reduced by evaporation to a sugar, of which specimens were brought to Paris by Captain D'Urville from the island of Tahiti. (Otaheite.) The root is there called *Ti* or *Tii*, and thence no doubt corrupted into *Tea-root* by the English and Americans. M. Gaudichaud mentions that in the Sandwich Islands generally an intoxicating drink is prepared from this root, to which the name *Ava* is often applied, as well as to that made with the roots of *Piper methysticum*.

Dracæna Draco is the best known species, not only from its producing Dragon's blood, but also from one specimen having so frequently been described or noticed in the works of visitors to the Canary Islands. The erect trunk of the Dragon-tree is usually from 8 to 12 feet high, and divided above into numerous short branches, which terminate in tufts of spreading sword-shaped leaves, pointed at the extremity. The most celebrated specimen of this tree grows near the town of Orotava, in the Island of Teneriffe, and was found by Humboldt in 1799 to be about 45 feet in circumference. Sir G. Staunton had previously stated it to be 12 feet in diameter at the height of 10 feet; and Ledru gave even larger dimensions. It annually bears flowers and fruit; and though continuing thus to grow, does not appear

much increased in size, in consequence of some of its branches being constantly blown down, as in the storm of July 1819, when it lost a great part of its top. The great size of this enormous vegetable is mentioned in many of the older authors; indeed as early as the time of Bethencourt, or in 1402, it is described as large and as hollow as it is now; whence, from the slowness of growth of *Dracœnas*, has been inferred the great antiquity of a tree which four centuries have so little changed. Humboldt, indeed, remarks that there can be no doubt of the *Dracœna* of Orotava being with the Baobab (*Adansonia digitata*) one of the oldest inhabitants of our planet, and as tradition relates that it was revered by the Guanches, he considers it as singular that it should have been cultivated from the most distant ages in the Canaries, in Madeira, and Porto Santo, although it comes originally from India. This fact he adduces as contradicting the assertion of those who represent the Guanches as a race of men completely isolated from the other races of either Asia or Africa. To this it may be replied, that we know too little of the Botany of the interior of Africa to be able to draw from it any inferences; while the Dragon-tree on the other hand is not known to exist further to the eastward than the island of Socotra.

DRACHM, or **DRAM**, a small measure of weight, the etymology of which is to be found in the Greek *drachma* (*δραχμή*). The drachm of our pound troy is stated to be nearly the same as the Attic drachma, or the Roman denarius (under the earlier emperors).

There are two drachms or drams remaining in our system of weights; the first is the sixteenth part of the ounce, which is the sixteenth part of the pound avoirdupois of 7000 grains: this is now totally out of use as no species of goods which are weighed by the avoirdupois weight are of such value as to make the sixteenth part of an ounce worth consideration. In the national standard, the troy pound of 5760 grains, there is no dram; but this weight occurs in that particular division of the troy pound which is used by apothecaries, in which the dram is the eighth part of the ounce, which is the twelfth part of the pound of 5760 grains. This is the real remnant of the Roman division; the denarius (which, according to Pliny, was the Attic drachma of his time) was, however, the *seventh* part of the ounce. The drachma or dram is used in England, France, Holland, Prussia, and in some parts of the Levant.

DRACHMA, from the Greek *drachme* (*δραχμή*), a silver coin. It was the chief coin in use among the Athenians, and probably other Greeks also. The didrachm or two drachms, the tridrachm or three drachms, and the tetradrachm or four drachms, were its multiples. The last was the largest form of Greek silver. The average weight of five drachmæ in the British Museum is 60.92 grains; and the average weight of three tetradrachmæ in the British Museum is 260.56 grains. The Attic drachma has been supposed to have been the same among the Greeks with the denarius among the Romans: others have disputed this; but both may be reconciled by the consideration that the number of drachmæ, as well as of denarii, which went to the ounce might have been subject to occasional variations.

(*Pitisci Lexicon Antiq. Gr. et Rom.*, v. Denarius; Pinkerton's *Essay on Medals*, vol. i., § 6; Kelly's *Universal Cambist*, 4to., Lond., 1821, vol. i., 3, 4, 9, 30, 34, &c.; vol. ii. 256.)

Drachma.

British Museum. Actual size. Silver. Weight, 61 $\frac{1}{2}$ grains.

DRACINA, the name given by Melandri to the colouring matter of dragon's blood, and which he supposed to be a vegetable alkali; but Berzelius and Herberger are of opinion that it does not possess alkaline properties: the last-mentioned chemist, indeed, calls this colouring matter *draconin*, and he considers it to possess rather sub-acid properties than such as denote alkalinity.

DRACO, an Athenian legislator, who flourished about the 39th Olympiad, 621 B.C. Suidas tells us that he

brought forward his code of laws in this year, and that he was then an old man. Aristotle says (*Polit.* ii. at the end), that Draco adapted his laws to the existing constitution, and that they contained nothing peculiar beyond the severity of their penalties. The slightest theft was punished capitally, as well as the most atrocious murder; and Demades remarked of his laws, that they were written with blood, and not with ink. (Plutarch, *Solon*, cxvii.) Draco, however, deserves credit as the first who introduced written laws at Athens, and it is probable that he improved the criminal courts by his transfer of cases of bloodshed from the archon to the *ephētæ* (Jul. Pollux, viii. 124, 125), since before his time the archons had a right of settling all cases arbitrarily, and without appeal, a right which they enjoyed in other cases till Solon's time. (Bekker's *Anecdota*, p. 449, l. 23.) It appears that there were some offences which he did not punish with death; for instance, loss of the civil rights was the punishment for an attempt to alter one of his laws. (Demosth. c. *Aristocr.*, p. 714, Bekk.) Draco was archon (Pausan. ix. 36, § 8), and consequently an eupatrid: it is not therefore to be supposed that his object was to favour the lower orders, though his code seems to have tended to abridge the power of the nobles. He died in the island of Ægina. On the legislation of Draco in general, see Wachsmuth, *Hellenische Alterthumskunde*, ii. 1, p. 239, and following.

DRACO (the dragon), one of the old constellations, referred by Higinus to the fable of the Hesperides. It is constantly stated by the older writers as being placed between *Ursa Major* and *Ursa Minor*, which hardly suits the present position of the constellation, since its principal stars are all contained between *Ursa Minor*, *Cepheus*, *Cygnus*, and *Hercules*. The two stars in the head (β and γ , the latter celebrated as passing very near the zenith of the south of England, and as being the one used in the discovery of aberration [BRADLEY],) are nearly in the line joining α Cygni (Deneb) and α Arcturus; while seven or eight smaller stars wind round *Ursa Minor* in such a manner as to render the name of the constellation not inappropriate. The extreme star (λ) is very nearly between the pole star and its pointers. [*URSA MAJOR*.] The principal stars are as follows:—

| Character. | No. in Catalogue of | | | Magnitude. | Character. | No. in Catalogue of | | | Magnitude. |

DRACONIN, the *dracina* above mentioned, may be obtained, according to Melandri, by macerating dragon's blood in water acidulated with sulphuric acid: this becomes of a yellow colour, but does not act upon the draconin, which is of a fine red colour and very fusible: it may be worked between the fingers, and drawn into threads. It melts at about 130°: on solidifying it becomes of a crimson colour, and when triturated gives a cinnabar red colour. It dissolves readily in alcohol, and the solution, which is of a fine red, becomes yellow on the addition of an acid; but on the ad-

dition of an alkali the red colour is restored. It does not appear to have been analyzed.

DRAGOMANS, or **DROGOMANS** (from the Turkish *Trukéman*); the interpreters attached to the European consulates and embassies in the Levant are so called. At Constantinople they are the chief, and in most cases the sole medium of communication between Christian ambassadors, who are ignorant of the Turkish language, and the Ottoman Porte. They are men born in the country, and are chiefly descended from old Genoese or Venetian settlers. Their local interests and sympathies have often interfered with their duties; and though there have been honourable exceptions, they are not distinguished as a body for honour and integrity. The French, as early as the time of Louis XIV., saw the propriety of employing native subjects in this capacity, and instituted a small body of young men, technically called *Jeunes de langue*, who were sent to the country to learn the language and acquaint themselves with its laws and customs. But this good plan has not been sufficiently supported. The dragomans and their families enjoy the protection of the nations whom they serve, and are exempted from Turkish law.

DRAGON. DRACONIDÆ, a family of Saurians, distinguished from their congeners in having their six first false ribs, instead of looping the abdomen, extending in a nearly straight line, and sustaining a production of the skin which forms a kind of wing comparable to that of the bats, but independent of the four feet. This wing sustains the animal like a parachute when it leaps from branch to branch, but does not possess the faculty of beating the air, and so raising the reptile into flight like a bird. All the species are small, covered entirely with small imbricated scales, of which those of the tail and limbs are carinated. The tongue is fleshy, but slightly extensile, and slightly jagged (*echanocrée*). Under the throat is a long pointed production (*fanon*), sustained by the hind part (*queue*) of the *os hyoïdes*, and at the sides are two other smaller ones, sustained by the horns of the same bone. The tail is long. The thighs have no pores. On the nape is a small dentilation. In each jaw are four small incisors, and on each side a long and pointed canine, and twelve triangular and trilobated molars.

Cuvier, whose description this is, says that the dragons have the scales and the gular appendage of the *Iguanas*, with the head and teeth of the *Stellionidæ*.

Skeleton of Dragon.

Geographical Distribution.—The known species which

Daudin first extricated from confusion come from the East Indies.

Draco fimbriatus.

DRAGON'S BLOOD. [*CALAMUS.*]

DRAGOON. [*CAVALRY.*]

DRAGUIGNAN, a town in France, capital of the department of Var. It is on the river Pis, or Nartuli, or Artuby, which falls into the Argens, 416 miles in a straight line south-south-east of Paris, or 552 miles by the road through Lyon, Valence, Avignon, Aix, and Brignolles; in 43° 32' N. lat., and 6° 30' E. long.

It has been supposed by some, but without sufficient reason, that Draguignan is on the site of the Forum Voconii of the Romans: it is however a place of considerable antiquity, having been mentioned in the titles of the earliest counts of Provence. Little historical interest is attached to it. Before the Revolution there were many religious houses here: the Reformed Dominicans, Augustinian Canons, Cordeliers, Minims, and Capuchins had convents; that of the Dominicans was very handsome; and there were nunneries for Ursulines and the nuns of the Visitation. The priests of the Christian doctrine had the direction of a college, and there was a tolerably well-built hospital. The bishop of Frejus had a palace here. The town is situated in a fertile plain surrounded by an amphitheatre of hills covered with vines and olive-trees. It is tolerably well built, and not badly laid out: it is adorned with numerous and copious fountains and many rows of trees. There is a clock-tower built upon a precipitous limestone rock, which crowns a small eminence, and rises as high as the roofs of the houses. The population in 1832 was 9070 for the town, or 9804 for the whole commune: the inhabitants manufacture coarse woollen cloths, leather, stockings, silks, wax-candles, and earthenware: there are many oil-mills. The environs produce excellent fruit and wines: gypsum is abundant, and there are stone-quarries in which large blocks of stone are quarried. There are a library, a cabinet of medals, a museum of natural history, containing chiefly the minerals of the department, a botanic garden, a high school, an agricultural society, and several prisons and foundling hospitals; the foundlings are chiefly illegitimate children.

The arrondissement, which is extensive, had in 1832 a population of 86,709.

DRAIN. [*SEWER.*]

DRAINING. As a certain quantity of moisture is essential to vegetation, so an excess of it is highly detrimental. In the removal of this excess consists the art of draining.

Water may render land unproductive by covering it entirely or partially, forming lakes or bogs; or there may be an excess of moisture diffused through the soil and stagnating in it, by which the fibres of the roots of all plants which are not aquatic are injured, if not destroyed.

From these different causes of infertility arise three

different branches of the art of draining, which require to be separately noticed.

1. To drain land which is flooded or rendered marshy by water coming over it from a higher level, and having no adequate outlet below.

2. To drain land where springs rise to the surface, and where there are no natural channels for the water to run off.

3. To drain land which is wet from its impervious nature, and where the evaporation is not sufficient to carry off all the water supplied by snow and rain.

The first branch includes all those extensive operations where large tracts of land are reclaimed by means of embankments, canals, sluices, and mills to raise the water; or where deep cuts or tunnels are made through hills which formed a natural dam or barrier to the water. Such works are generally undertaken by associations under the sanction of the government, or by the government itself; few individuals being possessed of sufficient capital, or having the power to oblige all whose interests are affected by the draining of the land to give their consent and afford assistance. In the British dominions there is no difficulty in obtaining the sanction of the legislature to any undertaking which appears likely to be of public benefit. In every session of parliament acts are passed giving certain powers and privileges to companies or individuals, in order to enable them to put into execution extensive plans of draining. That extensive draining in the counties of Northampton, Huntingdon, Cambridge, Lincoln, Norfolk, and Suffolk, which is known by the name of the **BEDFORD LEVEL**, was confided to the management of a chartered corporation, with considerable powers, as early as the middle of the seventeenth century, and by this means an immense extent of land has been rendered highly productive, which before was nothing but one continued marsh or fen.

In the valleys of the Jura, in the canton of Neuchâtel in Switzerland, which are noted for their industry and prosperity, and where the manufacture of watches is so extensive as to supply a great part of Europe with this useful article, extensive lakes and marshes have been completely laid dry, by making a tunnel through the solid rock, and forming an outlet for the waters. All these operations require the science and experience of civil engineers, and cannot be undertaken without great means. The greater part of the lowlands in the Netherlands, especially in the province of Holland, have been reclaimed from the sea, or the rivers which flowed over them, by embanking and draining, and are only kept from floods by a constant attention to the works originally erected.

Where the land is below the level of the sea at high water, and without the smallest eminence, it requires a constant removal of the water which percolates through the banks or accumulates by rains; and this can only be effected by sluices and mills, as is the case in the fens in England. The water is collected in numerous ditches and canals, and led to the points where it can most conveniently be discharged over the banks. The mills commonly erected for this purpose are small windmills, which turn a kind of perpetual screw made of wood several feet in diameter, on a solid axle. This screw fits a semicircular trough which lies inclined at an angle of about 30° with the horizon. The lower part dips into the water below, and by its revolution discharges the water into a reservoir above. All the friction of pumps and the consequent wearing out of the machinery is thus avoided. If the mills are properly constructed, they require little attendance, and work night and day whenever the wind blows.

In hilly countries it sometimes happens that the waters, which run down the slopes of the hills collect in the bottoms where there is no outlet, and where the soil is impervious. In that case it may sometimes be laid dry by cutting a sufficient channel all round, to intercept the waters as they flow down and to carry them over or through the lowest part of the surrounding barrier. If there are no very abundant springs in the bottom, a few ditches and ponds will suffice to dry the soil by evaporation from their surface. We shall see that this principle may be applied with great advantage in many cases where the water could not be drained out of considerable hollows if it were allowed to run into them.

When there are different levels at which the water is pent up, the draining should always be begun at the highest; because it may happen that when this is laid dry, the lower may not have a great excess of water. At all events, if the

water is to be raised by mechanical power, there is a saving in raising it from the highest level, instead of letting it run down to a lower from which it has to be raised so much higher.

In draining a great extent of land it is often necessary to widen and deepen rivers and alter their course; and not unfrequently the water cannot be let off without being carried by means of tunnels under the bed of some river, the level of which is above that of the land. In more confined operations cast-iron pipes are often a cheap and easy means of effecting this. They may be bent in a curve so as not to impede the course of the river or the navigation of a canal.

The draining of land which is rendered wet by springs arising from under the soil is a branch of more general application. The principles on which the operations are carried on apply as well to a small field as to the greatest extent of land. The object is to find the readiest channels by which the superfluous water may be carried off; and for this purpose an accurate knowledge of the strata through which the springs rise is indispensable. It would be useless labour merely to let the water run into drains after it has sprung through the soil and appears at the surface, as ignorant men frequently attempt to do, and thus carry it off after it has already soaked the soil. But the origin of the springs must, if possible, be detected; and one single drain or ditch judiciously disposed may lay a great extent of land dry if it cuts off the springs before they run into the soil. Abundant springs which flow continually generally proceed from the outbreking of some porous stratum in which the waters were confined, or through natural crevices in rocks or impervious earth. A knowledge of the geology of the country will greatly assist in tracing this, and the springs may be cut off with greater certainty. But it is not these main springs which give the greatest trouble to an experienced drainer; it is the various land springs which are sometimes branches of the former, and often original and independent springs arising from sudden variations in the nature of the soil and subsoil. The annexed diagram representing a section of an uneven surface of land will explain the nature of the strata which produce springs.

Suppose A A a porous substance through which the water filtrates readily; B B a stratum of loam or clay impervious to water. The water which comes through A A will run along the surface of B B towards S S, where it will spring to the surface and form a lake or bog between S and S. Suppose another gravelly or pervious stratum under the last, as C C C bending as here represented, and filled with water running into it from a higher level; it is evident that this stratum will be saturated with water up to the dotted line E F F, which is the level of the point in the lower rock, or impervious stratum D D, where the water can run over it. If the stratum B B has any crevices in it below the dotted line, the water will rise through these to the surface and form springs rising from the bottom of the lake or bog: and if B B were bored through and a pipe inserted rising up to the dotted line, as c o, the water would rise, and stand at o. If there were no springs at S S the space below the dotted line might still be filled with water rising from the stratum C C C. But if the boring took place at G the water would not rise, but on the contrary, if there were any on the surface, it would be carried down to the porous stratum E C C, and run off. Thus in one situation boring will bring water, and in another it will take it off. This principle being well understood will greatly facilitate all draining of springs. Wherever water springs there must be a pervious and an impervious stratum to cause it and the water either runs over the impervious surface or rises through the crevices in it. When the line of the springs is found, as at S S, the obvious remedy is to cut a channel with a sufficient declivity to take off the water in a direction across this line, and sunk through the porous soil at the surface into the lower impervious earth. The place for this channel is where the porous soil is the shallowest above the breaking out, so as to require the least depth of drain;

out the solid stratum must be reached, or the draining will be imperfect. It is by attending to all these circumstances that Elkington acquired his celebrity in draining, and that he has been considered as the father of the system. It is however of much earlier invention, and is too obvious not to have struck any one who seriously considered the subject. In the practical application of the principle great ingenuity and skill may be displayed, and the desired effect may be produced more or less completely, and at a greater or less expense. The advice of a scientific and practical drainer is always well worth the cost at which it may be obtained.

When there is a great variation in the soil, and it is difficult to find any main line of springs, it is best to proceed experimentally by making pits a few feet deep, or by boring in various parts where water appears, observing the level at which the water stands in these pits or bores, as well as the nature of the soil taken out. Thus it will generally be easy to ascertain whence the water arises, and how it may be let off. When there is a mound of light soil over a more impervious stratum, the springs will break out all round the edge of the mound; a drain laid round the base will take off all the water which arises from this cause, and the lower part of the land will be effectually laid dry. So likewise where there is a hollow or depression of which the bottom is clay with sand in the upper part, a drain laid along the edge of the hollow and carried round it will prevent the water running down into it, and forming a marsh at the bottom.

When the drains cannot be carried to a sufficient depth to take the water out of the porous stratum saturated with it, it is often useful to bore numerous holes with an auger in the bottom of the drain through the stiffer soil, and, according to the principle explained in the diagram, the water will either rise through these bores into the drains and be carried off, and the natural springs will be dried up, or it will sink down through them as at G, in the section, if it lies above. This method is often advantageous in the draining of peat mosses, which generally lie on clay or stiff loam, with a layer of gravel between the loam and the peat, the whole lying in a basin or hollow, and often on a declivity. The peat, though it retains water, is not pervious, and drains may be cut into it which will hold water. When the drains are four or five feet deep and the peat is much deeper, holes are bored down to the clay below, and the water is pressed up through these holes, by the weight of the whole body of peat, into the drains, by which it is carried off. The bottom of the drains is sometimes choked with loose sand, which flows up with the water, and they require to be cleared repeatedly; but this soon ceases after the first rush is past, and the water rises slowly and regularly. The surface of the peat being dried, dressed with lime, and consolidated with earth and gravel, soon becomes productive. If the soil, whatever be its nature, can be drained to a certain depth, it is of no consequence what water may be lodged below it. It is only when it rises so as to stagnate about the roots of plants that it is hurtful. Land may be drained so much as to be deteriorated, as experience has shown.

When a single large and deep drain will produce the desired effect, it is much better than when there are several smaller, as large drains are more easily kept open, and last longer than smaller; but this is only the case in tapping main springs, for if the water is diffused through the surrounding soil, numerous small drains are more effective: but as soon as there is a sufficient body of water collected, the smaller drains should run into larger, and these into main drains, which should all, as far as is practicable, unite in one principal outlet, by which means there will be less chance of their being choked up. When the water springs into a drain from below, it is best to fill up that part of the drain which lies above the stones or other materials which form the channel with solid earth well pressed in, and made impervious to within a few inches of the bottom of the furrows in ploughed land, or the sod in pastures; because the water running along the surface is apt to carry loose earth with it, and choke the drains. When the water comes in by the side of the drains, loose stones or gravel, or any porous material, should be laid in them to the line where the water comes in, and a little above it, over which the earth may be rammed in tight so as to allow the horses to walk over the drain without sinking in.

It sometimes happens, that the water collected from springs which caused marishes and bogs below, by being car-

ried in new channels, may be usefully employed in irrigating the land which it rendered barren before; not only removing the cause of barrenness, but adding positive fertility. In this case the lower grounds must have numerous drains in it, in order that the water let on to irrigate it may not stagnate upon it, but run off after it has answered its purpose.

The third branch in the art of draining is the removal of water from impervious soils which lie flat, or in hollows, where the water from rain, snow, or dews, which cannot sink into the soil on account of its impervious nature, and which cannot be carried off by evaporation, runs along the surface and stagnates in every depression. This is by far the most expensive operation, in consequence of the number of drains required to lay the surface dry, and the necessity of filling them with porous substances, through which the surface water can penetrate. It requires much skill and practice to lay out the drains so as to produce the greatest effect at the least expense. There is often a layer of light earth immediately over a substratum of clay, and after continued rains this soil becomes filled with water, like a sponge, and no healthy vegetation can take place. In this case numerous drains must be made in the subsoil, and over the draining tiles or bushes, which may be laid at the bottom of the drains, loose gravel or broken stones must be laid in to within a foot of the surface, so that the plough shall not reach them. The water will gradually sink into these drains, and be carried off, and the loose wet soil will become firm and dry. In no case is the advantage of draining more immediately apparent.

It is very seldom that a field is absolutely level; the first thing therefore to be ascertained is the greatest inclination and its direction. For this purpose there is an instrument essential to a drainer, with which an accurately horizontal line can be ascertained, by means of a plummet or a spirit level. A sufficient fall may thus be found or artificially made in the drains to carry off the water. The next object is to arrange drains so that each shall collect as much of the water in the soil as possible. Large drains, except as main drains, are inadmissible, since it is by the surface that the water is to come in, and two small drains will collect more than a larger and deeper. The depth should be such only that the plough may not reach it, if the land is arable, or the feet of cattle tread it in, if it be in pasture. All the drains which are to collect the water should lie as nearly at right angles to the inclination of the surface as is consistent with a sufficient fall in the drains to make them run. One foot is sufficient fall for a drain 300 feet in length, provided the drains be not more than 20 feet apart. The main drains, by being laid obliquely across the fall of the ground, will help to take off a part of the surface water. It is evident that the drains can seldom be in a straight line, unless the ground be perfectly even. They should, however, never have sudden turns, but be bent gradually where the direction is changed. The flatter the surface and the stiffer the soil, the greater number of drains will be required. It is a common practice with drainers to run a main drain directly down the slope, however rapid, and to carry smaller drains into this alternately on the right and left, which they call herring-bone fashion. But this can only be approved of where the ground is nearly level, and where there is very little fall for the main drain. A considerable fall is to be avoided as much as possible; and every drain should lie obliquely to the natural run of the water. It generally happens that, besides surface water, there are also some land springs arising from a variation in the soil; these should be carefully ascertained, and the drains should be so laid as to cut them off.

In draining clay land, where there is only a layer of a few inches of looser soil over a solid clay which the plough never stirs, the drains need not be deeper than two feet in the solid clay, nor wider than they can be made without the sides falling in. The common draining tile, which is a flat tile bent in the form of half a cylinder, and which can be made at a very cheap rate with the patent machine, is the best for extensive surface draining. In solid clay it requires no flat tile under it, it is merely an arch to carry the loose stones or earth with which the drain is filled up. Loose round stones or pebbles are the best where they can be procured; and in default of them, bushes, heath, or straw, may be laid immediately over the tiles, and the most porous earth that can be got must be used to fill the drains up: the stiff clay which was dug out must be taken away or spread

over the surface; for if it were put in the drain, it would defeat the object in view by preventing the water from running into it from above. In grass land, the sod may be laid over the drain, after it has been filled up so as to form a slight ridge over it. This will soon sink to a level with the surface, and in the mean time serves to catch the water as it runs down. To save the expense of stone or tiles, drains are frequently made six inches wide at the bottom, a narrow channel is cut in the solid clay, two or three inches wide and six deep, leaving a shoulder on each side to support a sod which is cut so as to fit the drain, and rests on the shoulders: this sod keeps the earth from filling the channel; and the water readily finds its way through it, or between it and the sides of the drain. It is filled up as described before: such drains are made at a small expense, and will last for many years.

Where the clay is not sufficiently tenacious, the bottom of the drain is sometimes cut with a sharp angle, and a twisted rope of straw is thrust into it. This keeps the earth from falling in, and the running of the water keeps the channel open; the straw not being exposed to the air, remains a long time without decaying. This is a common mode of draining in Norfolk, Suffolk, and Essex.

The best materials for large main drains, where they can be procured, are flat stones which readily split, and of which square or triangular channel is formed in the bottom of the drain. If the drain is made merely as a trunk to carry off the water, it is best to fill it up with earth, well pressed in, over the channel made by the stones; but if it serves for receiving the water through the sides or from the top, fragments of stone should be thrown over it to a certain height, and the earth put over these. A very useful draining tile is used in Berkshire and other places, which requires no flat tile under it, even in loose soils, because it has a flat foot to rest on, formed of the two thick edges of the tile, which, nearly meeting when the tile is bent round, form the foot. The section of the tile is like a horse-shoe. It is well adapted for drains where the water springs upwards, and it is less apt to slip out of its place than the common tile. They are usually made twelve or thirteen inches in length, but they are more expensive than the common tiles.

In draining fields it is usual to make the outlets of the drains in the ditch which bounds them. The fewer outlets there are, the less chance there is of their being choked: they should fall into the ditch at 2 ft. from the bottom, and a wooden trunk or one of stone should be laid so that the water may be discharged without carrying the soil from the side of the ditch. If there is water in the ditch, it should be kept below the mouth of the drain. The outlets of all drains should be repeatedly examined, to keep them clear; for wherever water remains in a drain, it will soon derange or choke it. The drains should be so arranged or turned, that the outlet shall meet the ditch at an obtuse angle towards the lower part where the water runs to. A drain brought at right angles into a ditch must necessarily soon be choked by the deposition of sand and earth at its mouth.

As the draining of wet clay soils is the only means by which they can be rendered profitable as arable land, and the expense is great, various instruments and ploughs have been contrived to diminish manual labour and expedite the work. Of these one of the simplest is the common mole-plough, which in very stiff clay makes a small hollow drain, from 1 ft. to 18 in. below the surface, by forcing a pointed iron cylinder horizontally through the ground. It makes a cut through the clay, and leaves a cylindrical channel, through which the water which enters by the slit is carried off. It requires great power to draw it, and can only be used when the clay is moist. In meadows it is extremely useful, and there it need not go more than a foot under the sod. Five to ten acres of grass land may easily be drained by it in a day. It is very apt, however, to be filled in dry weather by the soil falling in; and the animals from which it derives its name often do much damage to it by using it in their subterranean workings.

But a draining plough has been invented, which, assisted by numerous labourers, greatly accelerates the operation of forming drains, by cutting them out in a regular manner, when they are immediately finished with the usual tools and filled up. It has done wonders in some of the wet stiff soils in Sussex, and is much to be recommended in all wet and heavy clays. In stony land it cannot well be used. The subsoil plough, introduced to public notice by Mr. Smith

of Deanston, may be considered in some measure as a draining plough, for it loosens the subsoil, so that a few main drains are sufficient to carry off all the superfluous moisture; and it has besides the effect of not carrying off more than what is superfluous. By means of judicious drains and the use of the subsoil plough, the stiffest and wettest land may in time become the most fertile.

The tools used in draining are few and simple. Spades, with tapering blades of different sizes, are required to dig the drains of the proper width, and the sides at a proper angle. Hollow spades are used in very stiff clay. When the drain begins to be very narrow near the bottom, scoops are used, of different sizes, which are fixed to handles at various angles, more conveniently to clear the bottom and lay it smooth to the exact width of the tiles, if these are used; for the more firmly the tiles are kept in their places by the solid sides of the drain, the less likely they are to be moved. (Elkington, Stephens, Johnstone, Donaldson, Young, Marshall.)

DRAKE, SIR FRANCIS, was born in or about the year 1546, in an humble cottage on the banks of the Tavy, in Devonshire. His father, who was a poor and obscure yeoman, had twelve sons, of whom Francis was the eldest. According to Camden, who derived his information from Drake himself, Francis Russel, afterwards earl of Bedford, stood as his godfather, and John Hawkins, a distinguished navigator, defrayed the slight expenses of his short school education. In the days of persecution under Queen Mary, his father, who was known in his neighbourhood as a zealous protestant and a man of some acquirements, fled from Devonshire into Kent, where Drake was brought up; 'God dividing the honour,' says Fuller, 'betwixt two counties, that the one might have his birth and the other his education.' Under Elizabeth his father obtained an appointment 'among the seamen in the king's navy to read prayers to them;' and soon afterwards was ordained deacon, and made vicar of Upnor church on the Medway, a little below Chatham, where the royal fleet usually anchored. Francis thus grew up among sailors; and while he was yet very young, his father, 'by reason of his poverty, apprenticed him to a neighbour, the master of a bark, who carried on a coasting trade, and sometimes made voyages to Zealand and France.' This master kept Drake close to his work, and 'pains, with patience in his youth,' says Fuller, 'knit the joints of his soul, and made them more solid and compact.' When his master died, having no children of his own, he bequeathed to young Drake the bark and its equipments. With this he continued in the old trade, and had got together some little money, and was in the fair way of becoming a thriving man, when his imagination was inflamed by the exploits of his protector Hawkins in the New World; and suddenly selling his ship, he repaired to Plymouth, and embarked himself and his fortunes in that commander's last and unfortunate adventure to the Spanish Main. In this disastrous expedition Drake lost all the money he had in the world, and suffered not a little in character; for he disobeyed orders, and deserted his superior and his friend in the hour of need. He, however, showed skilful seamanship, and brought the vessel he commanded—the Judith, a small bark of 50 tons—safely home. A chaplain belonging to the fleet comforted Drake with the assurance that, as he had been treacherously used by the Spaniards, he might lawfully recover in value upon the king of Spain, and repair his losses upon him whenever and wherever he could. Fuller says, 'The case was clear in sea divinity; and few are such infidels as not to believe doctrines which make for their profit. Whereupon Drake, though a poor private man, undertook to revenge himself on so mighty a monarch, who, not contented that the sun riseth and setteth in his dominions, may seem to desire to make all his own where he shineth.' Being readily joined by a number of sea adventurers, who mustered among them money enough to fit out a vessel, Drake made two or three voyages to the West Indies, to gain intelligence and learn the navigation of those parts; but Camden adds, that he also got some store of money there, 'by playing the seaman and the pirate.' In 1570 he obtained a regular commission from Queen Elizabeth, and cruised to some purpose in the West Indies. In 1572 he sailed again for the Spanish Main, with the Pasha, of 70 tons, and the Swan, of 25 tons, the united crews of which amounted to 73 men and boys. He was joined off the coast of South America by another bark, from the Isle of Wight, with 88 men; and with this

insignificant force he took and plundered the town of Nombre de Dios, and made great spoil among the Spanish shipping. He partially crossed the Isthmus of Darien, and obtained a view of the great Pacific, an ocean as yet closed to English enterprise; and with his eyes anxiously fixed upon its waters, he prayed God to grant him 'life and leave once to sail an English ship in those seas.'

After some extraordinary adventures, Drake returned to England, with his frail barks absolutely loaded and crammed with treasure and plundered merchandise; and on the 9th of August, 1573, anchored at Plymouth. It was a Sunday, and the townsfolk were at church; but when the news spread thither that Drake was come, 'there remained few or no people with the preacher,' all running out to welcome the Devonshire hero.

Drake being employed in the interval in the service of the queen in Ireland, was forestalled in the honour of being the first Englishman to sail on the Pacific by one John Oxenham, who had served under him as common sailor and cook; but as this man merely floated a 'pinnace' on the South Sea, and was taken by the Spaniards and executed as a pirate, he could scarcely be an object of envy.

In 1577, under the secret sanction of Queen Elizabeth, Drake departed on another marauding expedition, taking with him five vessels, the largest of which was of 100, and the smallest of 15 tons. The united crews of this miniature fleet amounted to 164 men, *gentlemen* and sailors. Among the *gentlemen* were some young men of noble families, who (not to mention the plunder anticipated) 'went out to learn the art of navigation.' After many adventures along the coasts of the South American continent, where some of his attacks were completely successful, Drake and his choice comrades came to Port Julian, on the coast of Patagonia, near the Straits of Magalhaens, where they were much comforted by finding a gibbet standing—a proof that Christian people had been there before them. Drake, during his stay in Port Julian, put to death 'Master Doughtie,' a gentleman of birth and education, whose fate is still involved in some mystery, notwithstanding the laudable endeavours of Dr. Southey to rescue the fame of one of our greatest naval heroes from the suspicion of a foul murder.

On the 20th of August Drake reached Cape Virgenes, and sailed through the Strait of Magalhaens, being the third navigator who performed that passage. On the 17th day after making Cape Virgenes he cleared the strait, and entered the Pacific or South Sea. Having obtained an immense booty by plundering the Spanish towns on the coast of Chili and Peru, and by taking, among many other vessels, a royal galleon called the 'Cacafuego,' richly laden with plate, he sailed to the north in the hope of finding a passage back to the Atlantic, a little above California. He reached lat. 48° N., where the extreme severity of the cold discouraged his men, and he put back ten degrees, and took shelter in Port San Francisco. After staying five weeks in that port, he determined to follow the example of Magalhaens, and steer across the Pacific for the Moluccas. He made Ternate, one of the Molucca group, in safety, and thence set his course for Java.

From Java he sailed right across the Indian Ocean to the Cape of Good Hope, which he doubled without accident, and thence shaped his course homewards. He arrived at Plymouth on Sunday, the 26th September, 1579, after an absence of two years and nearly ten months, during which he had circumnavigated the globe, and spent many months on the almost unknown south-western coasts of America. Drake was most graciously received at court, and Elizabeth now asserted more firmly than ever her right of navigating the ocean in all its parts, and denied the exclusive right which the Spaniards claimed over the seas and lands of the New World. And though the queen yielded so far as to pay a considerable sum out of the treasure Drake had brought home to the procurator of certain merchants who urged, *with some reason*, that they had been unjustly robbed, enough was left to make it a profitable adventure for the privateers. At her orders Drake's ship was drawn up in a little creek near Deptford, there to be preserved as a monument of the most memorable voyage that the English had ever yet performed: she partook of a banquet on board the vessel, and there knighted the captain. During part of the year 1585, and the whole of 1586, Drake was actively employed against Philip II. on the coasts of Spain and Portugal, in the Canaries, the Cape de Verde, the West India

islands, and on the coast of South America, where Carthage and other towns were taken and plundered.

In the course of this expedition Drake visited the English colony in Virginia, which had been recently planted by Raleigh, and finding the colonists in great distress, he took them on board and brought them home with him. It is said that tobacco was first brought into England by the men who returned from Virginia with Drake. In 1587, when formidable preparations were making in the Spanish ports for the invasion of England, Elizabeth appointed Drake to the command of a fleet equipped for the purpose of destroying the enemy's ships in their own harbours. This force did not exceed thirty sail, and only four were of the Navy Royal, the rest, with the exception of two yachts belonging to the Queen, being furnished by merchant adventurers. In the port of Cadiz, the first place he attacked, he found sixty ships and many vessels of inferior size, all protected by land batteries. Drake entered the roads on the morning of the 19th April, and he burnt, sunk, or took thirty ships, some of which were of the largest size; and it appears he might have done much more mischief but for the necessity he was under of securing as much booty, in goods, as he could for the benefit of the merchant adventurers. He then turned back along the coast, taking or burning nearly a hundred vessels between Cadiz and Cape St. Vincent, besides destroying four castles on shore. This was what Drake called 'singeing the king of Spain's beard.' From Cape St. Vincent he sailed to the Tagus, and entering that river, came to anchor near Cascaes, whence he sent to tell the Marquis Santa-Cruz, who was lying up the river with a large force of galleys, that he was ready to exchange bullets with him. The marquis, who had been appointed general of the Armada preparing for the invasion of England, and who was esteemed the best sailor of Spain, declined the challenge, and he died (the English writers say of vexation at the mischief done by Drake) before that ill-fated expedition could sail.

The operations we have briefly related delayed the sailing of that armament more than a year, and gave Elizabeth time to prepare for her defence. Having thus performed the public service, Drake bore away to the Azores, on the lookout for the treasure ships from India, and he was so fortunate as to fall in with an immense carrack most richly laden. He took it, of course, and 'the taking of this ship,' says a contemporary, was of a greater advantage to the English merchants than the value of her cargo to the captors; for, by the papers found on board, they so fully understood the rich value of the Indian merchandizes, and the manner of trading into the eastern world, that they afterwards set up a gainful traffic, and established a company of East India merchants.' Drake generously spent a considerable part of his prize-money in supplying the town of Plymouth with good, fresh water, for hitherto there was none, except what the inhabitants fetched from a mile distance.

His next service at sea was as vice-admiral in the fleet under Charles Lord Howard of Effingham, lord high admiral of England, which, with the assistance of the elements, scattered and destroyed the 'Invincible Armada' of Spain. (ARMADA.) The seamanship of Drake, Hawkins, and Frobisher contributed largely to the happy result. In the following year, 1589, Drake was employed as admiral in an expedition sent to Portugal, in the hope of expelling the Spaniards, who had taken possession of that kingdom, by establishing the claims of Antonio, a pretender, around whom the English expected the Portuguese would rally. The whole expedition was badly planned, most miserably supplied with money and the other means of war, and but lamely executed after the landing of the troops. It was also disgraced by cruelties unusual even in that age, and inexcusable, notwithstanding the provocation which the English had so recently received on their own shores. In 1595 Drake and Sir John Hawkins, who had good experience in those parts, represented to Elizabeth that the best place for striking a blow at the gigantic power of Spain was in the West Indies; and an expedition thither was prepared, Drake and Hawkins sailing together with twenty-six ships, on board of which was embarked a land force under the orders of Sir Thomas Baskerville and Sir Nicholas Clifford. There were too many in command, and the usual bad consequences ensued. After losing time in debate they were obliged to give up an attempt on the Canaries with some loss. When they got among the West India islands Drake and Hawkins not only quarrelled but separated for some time, and before reaching the east end of Puerto Rico Hawkins died, his

death being generally attributed to the agitation of his mind.

One of Drake's smallest vessels was captured by the Spaniards, who, by putting the crew of it to the torture, extracted information respecting the plans of the expedition. When Drake attacked Puerto Rico he found that place fully warned and prepared, and his desperate attack was defeated. Sailing away, he took and burned Rio de la Hacha, Rancheria, Santa Martha, and Nombre de Dios; getting no greater spoil than 20 tons of silver, and 2 bars of gold. Drake remained in the harbour of Nombre de Dios, a most unhealthy place, while Baskerville with a part of the land forces made a vain and ruinous attempt to cross the isthmus of Darien, in order to plunder and destroy the city of Panama. A fatal disease broke out among soldiers and sailors, and soon deprived them of the important services of the chief surgeon of the fleet. When many of his men and three of his captains had died, the hardy Drake himself fell sick, and after struggling some twenty days with his malady, and the grief occasioned by his failures, he expired on the 27th of December, 1595. On the same day the fleet anchored at Puerto Bello, and in sight of that place, which he had formerly taken and plundered, his body received a sailor's funeral—

The waves became his winding sheet,
The waters were his tomb;
But for his fame the ocean sea
Was not sufficient room.

So sang one of his admiring contemporaries.

Though the reputation of Drake as a skilful seaman and a bold commander was deservedly great, still, unless we judge him by the circumstances and the standard of the times, he must appear in many of his exploits in no other light than that of a daring and skilful buccaneer. (Southey, *Naval History*; Harris, *Collection of Voyages*.)

DRAKENBORCH, ARNOLD, was born at Utrecht, in 1684, studied in that university under Grævius and Peter Burmann, and at the age of 20 wrote an elaborate dissertation 'De Præfectis Urbis,' which established his reputation as a scholar. The heads of the chapters will best explain the various bearings and the classical importance of the subject. Ch. 1. is 'De Præfectis Urbis in genere,' in which the author explains the various kinds of magistrates at Rome who bore this name at different epochs, their various appellations, such as Custos Urbis, &c. 2. 'De Præfectis Urbis sub Regibus institutis,' who were appointed by several kings to take care of the city of Rome during their absence in war. Similar officers were occasionally appointed under the republic during the absence of the two consuls. 3. 'De Præfecto Urbis feriarum Latinarum causa,' this was also a temporary magistrate appointed while the consuls were attending the Latin festivals on the Alban Mount. [ALBA LONGA.] 4. 'De ultimo Præfecto sub Imperatoribus creato.' Augustus created the permanent office of præfect of Rome, which was filled by a senator appointed by the emperor, sometimes for life, sometimes for a shorter period. Messala Corvinus was the first præfect appointed, but he soon after resigned, and Mæcenæ succeeded him. Panvinus, in his 'Annals,' has given a list of the præfects of Rome from Augustus to the fall of the empire. In the following chapters Drakenborch explains the nature, importance, and various duties of the office. 5. 'De his qui ad Præfecturam Urbis admittuntur, eorumque dignitate.' 6. 'De Jurisdictione Præfecti Urbis.' 7. 'De Curâ Præfecti Urbis circa annonam.' 8. 'De Curâ Præfecti Urbis circa ædificia.' 9. 'Idem circa ludos.' 10. 'De variis Officiis ad Præfectum Urbis pertinentibus.' 11. 'De Insignibus Præfecti Urbis.' The præfect of Rome was the first civil magistrate of the city and country around as far as the hundredth milliary stone; he ranked next to the emperor, was supreme judge in all important causes, heard appeals from the inferior magistrates, had charge of the police of the city, the superintendence of the markets and provisions, and, what was no less important at Rome, of the public games. He had under his orders the 'milites urbanos et stationarios,' a sort of militia which kept guard in the city.

This valuable little work of Drakenborch has gone through several editions; that of Bareuth, 1787, contains an extract from the author's funeral oration, by Professor Oosterdyk, in which the other works of Drakenborch are mentioned. Upon leaving Utrecht he went to Leyden to study the law, but there also he devoted his chief attention

to the classical lessons of Perizonius and Grenovius. He wrote, in 1707, another dissertation 'De Officio Præfectorum Prætorio,' in which he explains and illustrates the nature and duties of that important military office in the same manner as he had done for that of the præfects of the city. He states the changes made by various emperors, and lastly by Constantine, who, having abolished the prætorians, appointed four præfects of the prætorium, one for each division of the empire, who were supreme magistrates within their respective jurisdictions.

Drakenborch undertook, by the advice of Peter Burmann, an edition of Silius Italicus, which appeared in 1717. On Burmann's removal to Leyden, Drakenborch succeeded him in the chair of eloquence and history at Utrecht. His edition of Livy, on which he bestowed much time and labour, was published in 1738-46, in 7 vols. 4to. The value of the edition lies in the large collection of various readings, and the illustration of idioms by parallel passages drawn from the writings of Livy. The text is decidedly inferior to that which is found in the unpretending editions by Stroth, Raschig, &c. He published also, 'De Utilitate et Fructu humanarum Disciplinarum Oratio inauguralis,' 'Oratio funebris in Mortem Francisci Burmanni,' and other orations and dissertations, and also a 'History of Utrecht,' and 'Genealogies of the noble Families of Holland.' He died at Utrecht in 1747.

DRAMA, ATTIC (*δῶμα*, an action), is said by Aristotle (*Poet.* iv., 14) to have arisen from the recitations of the leaders of the **DITHYRAMBUS**. To understand this statement we must bear in mind that a Greek tragedy always consisted of two distinct parts; the dialogue, which was written in the Attic dialect, and corresponded in its general features to the dramatical compositions of modern times, and the chorus, which to the last was more or less pervaded by Dorians, and the whole tone of which was lyrical rather than dramatical. We must add that the metre of the dialogue, whether Iambic or Trochaic, was staid and uniform; while the choruses were written with every variety of metre. In a word, the dialogue was meant to be recited; the chorus was intended to be sung. It is obvious that these two elements must have had different origins. The one was an offshoot of the lyric poetry which sprung up among the Dorians, the other is to be referred to the rhapsodical recitations which were peculiar to the Ionian branch of the Greek nation; and as the Athenians stood in the middle between the Ionians and the Dorians, so the Attic drama may be considered as the point of intersection of the Ionian and Dorian literatures. That choral and consequently lyrical poetry should spring up among the Dorians was a natural result of the peculiar organization of a Doric state [DORIANS]; and the Epos as naturally arose among the Ionians, the countrymen of Homer. (*Hist. of the Literature of Greece, in the Library of Useful Knowledge*, p. 41 and following.) [HOMER.] The Ionian epic poetry, which was written in dactylic hexameters, was recited by a set of men called *rhapsodists* [RHAPSODY]; and the gnomic and didactic poetry of Hesiod was recited in the same way. But the dactylic hexameter was not found suitable for gnomic poetry, and a modification of it, consisting also of six feet, but each foot shorter by a half-time than the dactyl, was substituted for it. This metre (the Iambic), or a lengthened form of it (the Trochaic), was used by Archilochus, Simonides of Amorgus, and Solon, whose verses were recited by themselves or by rhapsodists in the same way as the epic poetry which preceded them.

The lyric poetry of the Dorians was originally appropriated to the worship of Apollo, but the particular odes and choruses used in this worship were in process of time transferred to the cognate deity, Bacchus (who was, like Apollo, the god of the sun [BACCHUS and DEMETER]; and these odes and choral dances had, all of them, their representatives in the dramatic poetry of a later age. (Athenæus, p. 630, n.) But the Dithyrambus was the earliest species of choral poetry connected with the worship of Bacchus, and it appears from many allusions, and indeed from Dithyrambic fragments, that while the body of the song was composed in irregular metres, the poet himself, or some rhapsodist, acting as exarchus, or leader, in his place, recited trochaics as an introduction. Here then was a mixture of recitation and chorus perfectly analogous to the tragedy of later time, which was probably suggested by it; and it is in this sense, we doubt not, that Aristotle

attributes to the leaders of the Dithyrambus the origin of tragedy.

We read of a lyrical tragedy long before Thespis, and this appears to have been a modification of the Dithyrambus, with a lyrical accompaniment instead of the flute-music to which it was originally danced, and with a substitution of men dressed as satyrs for the usual chorus, which alteration is attributed to Arion. The union of this lyrical tragedy with the recitations of rhapsodists is said to have been brought about by Thespis, a contemporary of Pisistratus and Solon, and may have been suggested as well by the recitations of the leaders of the Dithyrambus as by the union of rhapsodical recitations with Bacchic rites at the Brauronia. Thespis introduced one actor, an eraxchus, or rhapsodist, who, standing on an elevated place, while the dithyrambic chorus were grouped around the altar of Bacchus, carried on a dialogue with them, or narrated some mythical story in character. The comedy of ancient Greece originated in the festival of the vintage, when the country people went from one village to another, in carts or on foot, holding aloft the phallus, or emblem of productiveness, and indulging in rude jests and coarse invectives. From these effusions comedy was developed either in Megaris or in Sicily. Its first approach to perfection was owing to the genius of Epicharmus, who is said by Plato (*Theætet.* p. 152 E) to have borne the same relation to comedy that Homer did to tragedy. A similar comic drama sprung up about the same time at Athens, and was carried to a wonderful degree of strength and beauty.

The dramas of ancient Greece were always performed at and as a part of the festival of Bacchus [DIONYSIA]. The plays for exhibition had previously been submitted by their authors to a board of judges, and approved by them.

It would occupy too much space to give a complete catalogue of the very numerous works written on the Greek drama. A list of some of the principal of these will be seen at the end of the introduction to the fourth edition of the *Theatre of the Greeks* (Cambridge, 1836,) from which this account has been borrowed.

DRAMATIC ART AND LITERATURE. Of all the liberal arts, the dramatic (which, indeed, in its superior walks may be said to combine all the others) is that which is capable at once of the greatest comprehensiveness and of almost endless variety. This will distinctly appear from an attentive consideration of the several important elements essential to the producing of the highest class of theatrical exhibitions.

The first and simplest of the dramatic elements may be found existing in a high degree in works neither intended for the stage nor capable of being transferred to it—in simple dialogues. When, however, the persons of the colloquy deliver thoughts and sentiments which, though opposed to each other, operate no change, but leave the minds of both in exactly the same state in which they were at the commencement, the conversation may indeed be deserving of attention, but cannot be productive of any dramatic interest. To awaken the latter, the conversation must be animated by a different spirit. For instance, when, in Plato, Socrates asks the sophist, Hippias, what is the meaning of the beautiful, the latter promptly returns a superficial answer, but is afterwards compelled by the disguised attacks of Socrates to give up his former definition, and shift his ground again and again, until, ashamed and irritated at the superiority of the sage who has convicted him of his ignorance, he is at length reduced to quit the field. This dialogue is not only philosophically instructive, but arrests the attention like a little drama: and owing to this animation in the progress of the thoughts, and the solicitude with which we consequently look to the result, the dramatic character of the dialogues of Plato has always been justly admired.

From this we may conceive the great charm of dramatic poetry. 'Of all diversions,' observes the modern German critic, Schlegel, in his very able lectures on dramatic literature and art, 'the theatre is undoubtedly the most entertaining: we see important actions when we cannot act importantly ourselves: the highest object of human activity is man; and in the drama we see men, from motives of friendship or hostility, measure their powers with each other, influence each other as intellectual and moral beings, by their thoughts, sentiments, and passions, and decidedly determine their reciprocal relations. The art of the poet is to separate from the fable whatever does not essentially belong to it; whatever, in the daily necessities of real life,

and the petty occupations to which they give rise, interrupts the progress of important actions; and to concentrate within a narrow space a number of events calculated to fill the minds of the hearers with attention and expectation. In this manner it affords us a renovated picture of life—a compendium of whatever is animated and interesting in human existence.

'Nor is this all. Even in a lively verbal relation, it is frequently customary to introduce persons in conversation with each other, and to give a corresponding variety to the tone and the language. But the gaps which these conversations still leave in the story are filled up with a description of the accompanying circumstances, or other particulars, by the person who relates in his own name. The dramatic poet must renounce all such assistance; but for this he is richly recompensed in the following invention. He requires each of the characters in his action to be represented by a real person; that this person, in size, age, and figure, should resemble as much as possible the ideas which we are to form of his imaginary being, and even assume every peculiarity by which that being is distinguished; that every speech should be delivered in a suitable tone of voice, and accompanied by corresponding looks and motions; and that those external circumstances should be added which are necessary to give the hearers a clear idea of what is going forward. Moreover, these representatives of the creatures of his imagination must appear in the costume suitable to their assumed rank, age, and country; partly that they may bear a greater resemblance to them, and partly because there is something characteristic even in the dresses. Lastly, he must see them surrounded by a place which in some degree resembles that where, according to his fable, the action took place; because this also contributes to the resemblance: he places them on a scene. All this brings us to the idea of the theatre. It is evident that in the form of dramatic poetry, that is, in the representation of an action by dialogue without any narration, the ingredient of a theatre is essentially necessary. We allow that there are dramatic works which were not originally destined by their authors for the stage, and which would not produce any great effect on it, that still afford great pleasure in the perusal. I am, however, very much inclined to doubt whether they would produce the same strong impression upon a person who had never seen a play, nor ever heard a description of one, which they do upon us. We are accustomed, in reading dramatic works, to supply the representation ourselves.'

A visible representation, then, being essential to the dramatic form, a dramatic work may be considered in a double point of view—how far it is poetical, and how far it is theatrical. In considering its poetical qualities it is not the versification and the ornaments of language that we have chiefly in contemplation, but the poetry in the spirit and plan of a piece; and this may exist in a high degree, when even it is written in prose. To be poetical in the higher sense, it must in the first place be a connected whole, and complete within itself. But this is merely the negative condition of the form of a work of art, by which it is distinguished from the phenomena of nature, which flow into one another, and do not possess an independent existence. To be poetical, it is necessary that it should be a mirror of ideas, of thoughts, and feelings, in their character necessary and eternally true, though moulded into an imaginative whole.

But how does a dramatic work become theatrical, or fitted to appear with advantage on the stage? The object proposed is, to produce an impression on an assembled crowd, to gain their attention, and excite in them an interest and participation. This part of his task is common to the poet with the orator. The latter attains his end by perspicuity, rapidity, and force. Whatever exceeds the ordinary measure of patience or comprehension, he must carefully avoid. Moreover, a number of men assembled together constitute an object of distraction to one another, if their eyes and ears are not directed to a common object beyond their own circle. Hence the dramatic poet, as well as the orator, must at the very outset produce an impression strong enough to draw his hearers from themselves, and so become master, as it were, of their bodily attention.

'The grand requisite in a drama,' remarks Schlegel, 'is to make the rhythmus visible in its progress. When this has once been effected, the poet may the sooner halt in his rapid career, and indulge his own inclinations. There are points where the most simple or artless tale, the inspire'

lyre, the most profound thoughts and remote allusions, the smartest coruscations of wit, and the most dazzling flights of a sportive or ethereal fancy, are all in their place, and where the willing audience, even those who cannot entirely comprehend them, follow the whole with a greedy ear, like a music in harmony with their feelings. The great art of the poet is, to avail himself of the effect of contrasts wherever he can,—to exhibit with equal clearness, at some times a quiet stillness, the musings of self-contemplation, and even the indolent resignation of exhausted nature, and at others the most tumultuous emotions, the raging storm of the passions. With respect to the theatrical, however, we must never forget that much must be suited to the capacities and inclinations of the audience, and consequently to the national character in general, and the particular degree of civilization. Dramatic poetry is in a certain sense the most worldly of all; for, from the stillness of an inspired mind it exhibits itself in the midst of the noise and tumult of social life. The dramatic poet, more than any other, is bound to court external favour for applause.

It is important that we should enter into a preliminary consideration of the distinction which, we think, has been too rigorously drawn, in treating of dramatic composition, between the tragic and the comic species. Least of all the arts will the dramatic admit of that mechanical mode of critical analysis, to which indeed the spirit of all true art is essentially repugnant. We have already observed, that, even above all other artists, the dramatist, on whatever subject he employs his talent, is bound to seek, first of all, to please. Whether tragedy or comedy has attracted the spectator to the benches of the theatre, it is entertainment that he is come in quest of. The dramatist who cares to succeed in his art must therefore make it his primary object to furnish that entertainment. Let it not be supposed, as seems to have been mistakenly thought even by some critics of eminence, that any one goes voluntarily to witness a tragedy for the sake of painful excitement. Among the numerous and extremely miscellaneous audience collected in a great national theatre (which very diversity is not one of the least interesting circumstances incidental to our subject) there is, indeed, to be found, at one and the same moment, every grade of intellect, of feeling, and of taste; but even the rudest and most ignorant spectator, in the most animated scenes of the most admirably exhibited drama, never once thoroughly mistakes illusion for reality. Were he once to do so, the pleasing spell would be dissolved. It is not the presence of deep distress or convulsive passion that holds the theatrical auditor in pleasingly fascinated attention; it is the vivid picture of it. This grand mistake of regarding the audience as considering themselves present at an actual transaction has vitiated in several most important respects the judgment of some of the ablest writers on the principles of dramatic art. Most of the spectators, on the contrary, know very well what they go to see in the scenes of a play,—a series, closely and artfully connected, of living, moving, and speaking pictures,—but nothing more. Between the contemplation of actual suffering and that of the most lively representation of it, there is, as the art of the dramatist shows us yet more vividly than that of the painter, all the difference between deep pain and genuine though melancholy pleasure. In the drama, as in painting, the most prosaic and literal imitation of nature, skilfully executed, whether the subject be mournful or cheerful, gives some pleasure to the most ordinary observer; while a poetical imitation affords a more refined gratification to the man of taste, whether the scene be one of joyousness or sorrow. The pleasure, indeed, which he will derive from a piece of art on a melancholy subject will bear a different hue from that afforded him by a mirthful or cheerful piece; but pleasure it will still be, and pleasure only. It is the power of art that captivates him, and to which he yields involuntary homage. The different kinds of pleasure that flow from dramatic representations, according as their subjects partake more or less of the cheerful or the melancholy ingredients, we shall shortly come to consider. Only we have thought it necessary to insist strongly in the first instance on the essential fallacy of the assumption that people go to a tragic representation to receive impressions analogous to those which they experience in the contemplation of actual woe.

The first business of the dramatist, then, is to produce at least a faithful copy, but, if it be in his power, a poetical imitation of nature: this is the first condition of his giving

pleasure. But as for the arbitrary distinction between tragedy and comedy, which criticism, whose birth is so long posterior to that of art, has established in so large a portion of civilised Europe, the more he has in him of the genuine artist the less will he feel inclined to conform rigidly to that critical demarcation. When we consider the infinitely chequered nature of human life and character, and consequently the boundless resources which it offers to the drama as its poetical mirror, we cannot but at once perceive that the images which that mirror is capable of presenting to us are susceptible of a diversity of features and of hues immensely exceeding the capabilities of any other single art—nay, of all of them combined. Now, among this boundless variety of pictures from human life, in all of which, embracing any considerable prospect, the serious and the mirthful must be mingled, it is plain that the proportions in which these two necessary elements exist in the same composition will admit of infinite gradation. In the nature of things, however, the portion of dramatic productions in which they may be taken to be equally balanced must be very small in comparison with that in which one of the two manifestly preponderates. This necessary preponderance, in the great majority of such works, of the mirthful or the serious element, is, it seems to us, the only sound and proper basis for the distinction between tragedy and comedy. The terms should be employed as convenient heads of classification, but as nothing more. Every work of art, in the higher sense of the word, is as much a work of inspiration as of ingenuity: it is a *growth* rather than a *structure*; and to reject a production of high dramatic genius because it should not fit into the conventional frame of tragedy, comedy, &c., so long the practice of one of the great dramatic schools of Europe, were no less absurd than it would be to exclude some newly-discovered plant from the domain of natural history because there should be no suitable place for it in the previously existing scientific nomenclature. This is a matter which we shall more clearly illustrate when we come, in another place, to speak of the dramatic genius of Shakspeare; but so much in general treatises on the drama has hitherto been written on the plan of making the principles of art subordinate to the distinctions of criticism, that it was impossible to take one satisfactory step in unfolding our view of the subject without explicitly protesting, in the first instance, against so vicious an inversion.

A complete history of the drama would be almost equivalent to a history of civilised society over the greater part of the earth. 'Man,' says Schlegel, 'has a great disposition to mimicry. When he enters vividly into the situation, sentiments, and passions of others, he even involuntarily puts on a resemblance to them in his gestures. Children are perpetually going out of themselves: it is one of their chief amusements to represent those grown people whom they have had an opportunity of observing, or whatever else comes in their way; and with the happy flexibility of their organization, they can exhibit all the characteristics of assumed dignity in a father, a schoolmaster, or a king. The sole step further which is requisite for the invention of a drama, namely, the separating and extracting the mimetic elements and fragments from social life, has however in many nations never been taken. In the very minute description of ancient Egypt, in Herodotus and other writers, I do not recollect observing the smallest trace of it. On the other hand, the Etrurians, who in many respects resembled the Egyptians, had their theatrical representations: and, what is singular enough, the Etrurian name for an actor, *histrio*, is preserved in living languages down to the present day. The Arabians and Persians, though possessing a rich poetical literature, are unacquainted with any sort of drama

'On the other hand, we are by no means entitled to assume that the invention of the drama has only once taken place in the world, or that it has always been borrowed by one people from another. The English navigators mention, that among the islanders of the South Seas, who in every mental acquirement are in such a low scale of civilization, they yet observed a rude drama, in which a common event in life was imitated for the sake of diversion. And to go to the other extreme—among the Hindoos, the people from whom, perhaps, all the cultivation of the human race has been derived, plays were known long before they could have experienced any foreign influence. It has lately been made known to Europe that they have a rich

dramatic literature, which ascends back for more than two thousand years. The only specimen of their plays (*natak*) hitherto is the delightful *Sacountala*, which, notwithstanding the colouring of a foreign climate, bears, in its general structure, so striking a resemblance to our romantic drama that we might be inclined to suspect we owe this resemblance to the predilection for Shakspeare entertained by Jones (Sir William), the English translator, if his fidelity were not attested by other learned orientalists. In the golden times of India, the representation of this *natak* served to delight the splendid imperial court of Delhi; but it would appear that, from the misery of numberless oppressions, the dramatic art in that country is now entirely at an end. The Chinese, again, have their standing national drama, stationary perhaps in every sense of the word; and I doubt not that, in the establishment of arbitrary rules, and the delicate observance of insignificant points of decorum, they leave the most correct Europeans very far behind them. When the new European stage, in the fifteenth century, had its origin in the allegorical and spiritual pieces called *moralities* and *mysteries*, this origin was not owing to the influence of the ancient dramatists, who did not come into circulation till some time afterwards: in those rude beginnings lay the germ of the *romantic* drama as a peculiar invention.

In this summary we shall not enter into any further examination either of the ancient or the existing oriental drama. Notwithstanding the great extent and fertility, the vast population and industry of those remoter Asiatic regions, the spirit of their social institutions, to whatever moral causes originally owing, seems to doom them (external influences apart) to a perpetual stationariness, excluding them as it were from the history of general civilization, which is essentially the history of progress. To the European races and nations it is plain that the destinies of human improvement, in all quarters of the earth, are chiefly committed; so that there is no impropriety, and little incompleteness, in confining our view to the nations of Europe, while taking a general survey of that important department of the belles-lettres and the fine arts which has held and must continue to hold so conspicuous a place among those things which, in the long stream of human history, have appeared successively as results and as causes of social amelioration.

We know that European civilization is now running at least its second course. We know that its former, and, as far as we have any historical indications, its first career began in Greece; and that in the small state of Athens especially, owing chiefly, it should seem, to the very high degree of civil freedom and equality which it acquired and long maintained, that early civilization, in all its nobler features, took a more vigorous and various development than it reached not only in any of the other Grecian states, but in the gigantic empire of Rome itself in its most polished days. The Roman drama in particular, for reasons which we shall indicate below, remained to the last little more than a faint imitation of the Athenian; so that it is not only primarily, but almost exclusively, the Grecian theatre, or, more strictly speaking, that of Athens, which we have to consider in treating generally of the ancient drama.

Æschylus, the true father of the Attic drama (so far at least as we are acquainted with it,) was born in Attica about the year B.C. 525, and died probably about B.C. 456, having survived the splendid victories of Salamis, Plataea, and Mycale. Thus he may be said to have flourished during the vigorous youth of Athenian liberty and glory. He burned with all the ardour of a Grecian warrior of that day, when every citizen was a hero; and he commanded with distinction in the two most memorable actions of that illustrious period of his country's history, the battles of Marathon and Salamis. He just lived through the period in which both the democratic and the military spirit of Athens were excited to the highest pitch, and when consequently the heroic strains of Homer were in the highest favour among his countrymen, and would be recited with the most glowing enthusiasm. Conscious of such exalted poetical powers,—a witness and a sharer of such high patriotic achievement,—it is not surprising that the fiery genius of *Æschylus* should have inspired him to attempt to bring the powers of poetry to act upon his countrymen in some more vivid manner than lay within the province either of the lyric or the epic muse.

The substitution of dialogue and action in the place of mere recitation, the transition from the heroic narrative to the heroic drama, the making himself, in short, a dramatic Homer; such appears to have been the grand original conception, such the leading idea of *Æschylus* in this great literary invention. The highly-wrought poetical and martial enthusiasm of his countrymen sufficiently assured him of success in bringing his compositions before them; an effect which, like every man on the like occasion who with great inventive power combines great knowledge of actual life, he availed himself of such already existing medium as could with least violence be converted to his purpose. The festivals of Bacchus, as then celebrated, offered the fairest opening for his new experiment; he laid hold on the serious part of the celebration, the mixture of the dithyrambic chant with recitation, and modified that primitive species of tragedy into the heroic drama or regular tragedy, according to the subsequent acceptance of the term.

There are, however, three grand characteristics of tragedy as conceived by *Æschylus*, that distinguish it widely from the serious drama of modern times. These are, 1. The religious tone which pervades it throughout; 2. The ideal nature of the whole representation; 3. The large part in the composition still assigned to the lyric mass. These three matters we shall endeavour to place in a clear light before the reader, as upon a knowledge of them mainly depends the capability to form something like an accurate notion of the distinctive character of Grecian tragedy.

First, as regards the religious complexion of the Athenian drama. Modern readers, familiarised from their infancy with the names, attributes, and images of the ancient deities, merely as presenting an inexhaustible storehouse of graceful poetic ornament, almost inevitably forget, in turning to peruse any original work of the ancients, that, how much soever their philosophers, their poets, or their priests, might regard their principal divinities in a purely symbolical view, yet that to the minds of the people at large they were real and awful existences, having will, passions, and various kinds and degrees of dominion over the fortunes and the happiness of man. This important fact has not hitherto been sufficiently taken notice of in modern accounts of the ancient drama. All the deities, male or female, celestial or infernal, were objects of fear and propitiation: only the execrable Fates were unappeasable by god or man. Fate indeed, was the only omnipotence recognised in the mythological system of the Greeks; for Jupiter himself, the ruler of the celestial deities, the sovereign of Olympus, was regarded neither as eternal nor as infinite in power. Nowhere have poetry and her sister arts been so thoroughly devoted to the service of religion as they were in ancient Greece. Thus we find the drama itself lying in embryo in the worship of Bacchus; and when in its maturity it lost the direct character of a religious rite, we still find the sacred character impressed on tragedy even more solemnly than upon any of the other productions of Athenian genius not primarily devoted to religious objects. So long, indeed, as the personages of a long established faith (and here we speak solely with reference to the purposes of art), whether the gods and heroes of the heathen world, or the mysterious persons of the godhead, the angels, devils, and saints of the Christian system,—so long, we say, as these awful personages can furnish fresh materials to an epic or dramatic poet of powers equal to such a class of subjects, the grand and successful performances of a Dante, a Tasso, and a Milton, show us, not less strikingly than those of a Homer or an *Æschylus*, that these are the most attractive themes for the exercise of the loftiest poetic genius, and those which it handles with the most powerful effect.

The *ideality* of the scenic representation, as arranged by *Æschylus*, necessarily resulted from the adoption, in the composition of the drama, of ideal and of nearly ideal characters. 'The use of masks,' observes Schlegel, 'which appears astonishing to us, was not only justifiable on this principle, but absolutely essential; and far from considering them in the light of a last resource, the Greeks would justly have considered as a last resource the being obliged to allow a player with vulgar, ignoble, or strongly-marked individual features, to represent an Apollo or a Hercules. To them this would have appeared downright profanation. . . . As the features of the player acquired a more decided expression from the mask, as his voice was strengthened by a contrivance for that purpose, so also the *colthurnus*, which consisted of several considerable additions to his shoes, as

we may see in the antient statues of Melpomene, raised his figure considerably above the middle standard. The female parts, too, were played by men, as the voice and other qualities of women would have conveyed an inadequate idea of the energy of tragic heroines. The forms of the masks* and the whole appearance of the tragic figures, we may easily suppose, were sufficiently beautiful and dignified. We should do well to have the antient sculpture always present to our minds; and the most accurate conception, perhaps, that we can possibly have, is to imagine them so many statues in the grand style, endowed with life and motion. But as in sculpture they were fond of dispensing as much as possible with dress, for the sake of exhibiting the more essential beauty of the figure; on the stage they would endeavour, from an opposite principle, to clothe as much as they could well do, both from a regard to decency, and because the actual forms of the body would not correspond sufficiently with the beauty of the countenance. They would also exhibit their divinities, which in sculpture we always observe either entirely naked or only half covered, in a complete dress. They had recourse to a number of means for giving a suitable strength to the forms of the limbs, and thus restoring proportion to the increased height of the player.

'The great breadth of the theatre, in proportion to its depth, must have given to the grouping of the figures the simple and distinct order of the bas-relief. We moderns prefer on the stage, as everywhere else, groups of a more picturesque description, more crowded, partly covered by themselves, and stretching out into distance; but the antients were so little fond of foreshortening, that even in their painting they generally avoided it. The gestures accompanied the rhythmus of the declamation, and were intended to display the utmost beauty and harmony. The poetical conception required a certain degree of repose in the action, and that the whole should be kept in masses, so as to exhibit a succession of plastic attitudes; and it is not improbable that the actor remained for some time motionless in the same position. But we are not to suppose from this that the Greeks were contented with a cold and spiritless representation of the passions. How could we reconcile such a supposition with the fact that whole lines of their tragedies are frequently devoted to inarticulate exclamations of pain, to which we have nothing correspondent in any of our modern languages? It has often been conjectured that the delivery of their dialogue must have resembled the modern recitative. For this conjecture there is no other foundation than that the Greek, like almost all the southern languages, must have been pronounced with a greater musical inflexion of the voice than our languages of the north. In other respects I conceive that their tragic declamation must have been altogether unlike recitative, much more measured, and far removed from its learned and artificial modulation. The antient tragedy has also been frequently compared to the opera, because it was accompanied with music and dancing. But this betrays entire ignorance of the spirit of classical antiquity. Their dancing and music had nothing in common with ours but the name. In tragedy the chief object was the poetry, and every other thing was strictly subordinate to it; whereas in the opera the poetry is merely an accessory, the means of connecting the different parts together, and is almost buried under its associates.'

In the syllabic composition, which then at least prevailed

* We have obtained a knowledge of these from the imitations in stone which have come down to us. They display both beauty and variety. That great variety must have taken place in the tragical department (in the comic we can have no doubt about the matter) is evident from the rich store of technical expressions in the Greek language for every gradation of the age and character of masks. (See the *Onomasticon* of Julius Pollux.) In the marble masks, however, we can neither see the thinness of the mass from which the real masks were executed, the still more delicate colouring, nor the exquisite mechanism of the joints. The abundance of excellent workmen possessed by Athens in everything which had reference to the plastic arts will warrant the conjecture that they were in this respect inimitable. Those who have seen the masks of wax in the grand style, which in some degree contain the whole head, lately contrived at the Roman carnival, may form to themselves a pretty good idea of the theatrical masks of the antients. They imitate life even to its movements in a most masterly manner; and at such a distance as that from which the antient players were seen, the deception is most perfect. They always contain the apple of the eye, as we see it in the antient masks; and the person covered sees merely through the aperture left for the iris. The antients must have gone still farther, and contrived also an iris for the masks, according to the anecdote of the singer Thamyras, who, in a piece which was probably of Sophocles, made his appearance with a blue and a black eye. Even accidental circumstances were imitated; as, for instance, the cheeks of Tyro, down which the blood had rolled from the cruel treatment of his step-mother. Owing to the mask, the head must no doubt have appeared somewhat large for the rest of the figure; but this disproportion, in tragedy at least, would be obviated by the elevation of the cothurnus.

in the Grecian music, the solemn choral song had no other instrumental accompaniment than a single flute, which could not impair the distinctness of the words. The choruses and lyrical songs in general form the portion most difficult to understand of the antient tragedy, and must also have been the most difficult to contemporary auditors. They abound with the most involved constructions, the most unusual expressions, and the boldest images and allusions. Such labour and art would hardly have been lavished upon them by the poets merely to be lost in the delivery. Such a display of ornament without aim is very unlike the mode of thinking of the Greeks. In the syllabic measure of their tragedy there generally prevails a highly-finished regularity, which, however, by no means appears a stiff symmetrical uniformity. Besides the infinite variety of the lyrical strophes, they have also a measure to denote the mental transition from the dialogue to the lyric, the anapest; and two for the dialogue itself, of which the one by far the most general, the iambic trimeter, denoted the regular progress of the action, and the other, the trochaic tetrameter, was expressive of sudden passion. Indeed, the simplicity of the Greek tragedy, of which so much has been said, attaches only to the plan; for the richest variety of poetical ornament is observable in the execution. It must be remembered, too, that the utmost accuracy in the delivery of the different modes of versification was expected from the player, as the delicacy of the Grecian ear would not excuse, even in an orator, the false quantity of a single syllable.

'Modern critics,' says Schlegel, 'have never known what to make of the chorus.' This has arisen from the error by which criticism has been almost universally pervaded, viz., the viewing a production of art not in relation to the manners and the circumstances which surrounded its author, but to those existing around the critic himself. A very moderate degree of attention to the circumstances amidst which the Athenian drama took its birth is sufficient to remove everything like astonishment at the share which the lyrical element preserved in its composition. Among the most poetical people that has ever existed everything of the nature of a spectacle demanded the aid of song. The warlike march, the religious and the convivial procession, the nuptial ceremony, the feast and the funeral, would to them have been utterly spiritless and unmeaning without this accompaniment. The epic form, too, under which their greater and more national compositions present themselves to us in their earlier times, had, for a long period before the rise of the dramatic art among them, been rivalled by the lyric; and many old subjects of high heroic song had been embodied under a new shape in grand choral compositions, which, observes Mr. Thirlwall (*Hist. of Greece*, chap. xii.) 'uniting the attractions of music and action with those of a lofty poetry, formed the favourite entertainment of the Dorian cities. This appears to have been the germ out of which, by the introduction of a new element, the recitation of a performer who assumed a character, and perhaps from the first shifted his mask so as to exhibit the outlines of a simple story in a few scenes parted by the intervening song of the chorus, Thespis and his successors gradually unfolded the Attic tragedy.'

We must therefore dissent from the view taken by Schlegel himself of the origin and objects of the dramatic chorus of the Greeks. In considering this, as well as some other characteristics of the Grecian theatre, he has laboured under somewhat of the disability which we have mentioned above as attaching to the critics of latter ages in general. He has judged of the Athenian dramatists too exclusively from their remaining productions, without sufficient regard to all that existed immediately before and around them. Writings, we must recollect, were exceedingly scarce. It was by oral recitation that the greatest and most favourite productions of the epic and the lyric poets were chiefly circulated, and transmitted with more or less completeness to the memories of the multitude; so that, inasmuch as they were in all times intimately associated with vocal delivery and animated gesture, even the simply epic and lyric chants had possessed among the Greeks much more of the vivid charms of dramatic recitation than is very readily conceivable by a modern to whom books are so easily and abundantly accessible. A modern poet writes, above all things, to be read; but the Grecian poet, even the epic poet, wrote, above all things, to be sung. In short, the union between music and poetry, among the Greeks more especially, down to the period which gave rise to the drama, was uniform and

intimate, but with this important condition, that sound was ever kept subordinate to thought.

Such being the firmly established practical circumstances of Greece, a transition all at once from the combined epic and lyric forms to the purely dramatic was, we conceive, neither practicable even to a genius of the first order, as we admit *Æschylus* to have been, nor very likely even to enter into his imagination. *Æschylus* by no means introduced the chorus into the drama: he may be much rather said to have introduced the drama into the chorus; and that of itself was no slight achievement. We have already remarked that the idea of any great public exhibition unaccompanied by choral songs was one into which the Greek taste and imagination of that day could by no means enter. So strong however was the bent of *Æschylus* towards the dramatic, that he not only retains the chorus as a lyrical accompaniment, but gives it also a participation in the action itself. This, in stamping the dramatic character upon the whole performance, was as far as he could venture to go, and, as we have already said, was most likely as far as he desired to go.

We must now, in order to complete the idea which we desire to present of the material forms of the Grecian drama, give a short account of the architectural structure and arrangement of the edifice itself in which the pieces were exhibited, when once, under the hand of *Æschylus*, their dramatic element was distinctly developed. Brief as we shall endeavour to make this description, some detail is indispensable, owing to the very different plan from the modern upon which the whole conception and design of the ancient drama required that its theatres should be constructed.

The theatres of the Greeks were open to the sky, and their dramas were always acted during the day, a mode of construction and of exhibition which was highly favoured by the beauty of their climate. As regards the inconvenience which many modern critics have supposed the poets to have felt, from the necessity of always laying the scene of their pieces before houses, and thus often violating probability, it should be observed that the Greeks lived much more in the open air than we do, and transacted many things in public places which with us usually take place in houses; and the stage did not represent a street, but a space before the house and belonging to it, wherein stood an altar on which the sacrifices to the household gods were offered up. Here the women, who among the Greeks lived in so retired a manner, might appear without impropriety, even the unmarried ones. Neither was it impracticable to give a view of the interior of the houses: this was done by means of the encyclema, which we shall presently describe.

The Grecian theatres, destined, not like those of the moderns, for a long succession of daily exhibitions, but for the celebration of a few annual festivals, were of that colossal magnitude which was indispensable to contain, as it were, the whole body of the people, together with the concourse of strangers who flocked to these solemnities. The distance to which the eyes of the spectators were thus necessarily thrown from the acted scene presents another obvious reason for and justification of the artificial expansion, as we may term it, of the whole figure of the actor. The groups on the stage, not to appear absolutely insignificant, needed, if possible, to be represented larger than life; and besides the fundamental reason which we have already stated for the constant use of the mask, that play of the actor's features which it concealed could not have been perceived with any distinctness across the vast space which separated him from the audience. Analogous to the use of the mask, the buskin, &c., were certain contrivances for increasing the loudness of the voice. *Vitruvius* tells us also of vehicles of sound distributed throughout the building; and though of these we have no very clear account, we may safely assume that the theatres of the ancients were constructed on very perfect acoustical principles. We know from existing remains that all who were present at the dramatic exhibition could be, in the literal sense of the word, spectators: the seats for them consisted of steps rising backwards round the semicircle of the orchestra, the name given to the whole internal area called in a modern theatre the pit. The lowest step of this amphitheatre was raised considerably above the orchestra; and opposite to it was the stage, placed at an equal elevation. The sunk semicircle of the orchestra contained no spectators, but served another purpose, which we shall shortly have to mention. The stage consisted of a

strip, which, forming the chord of the semicircle, extended from one end of the building to the other, but the depth of which bore little proportion to this length. This was called the logeum, or, in Latin, *pulpitum*, and the usual place for the dramatic action was in the middle of it. Behind this middle part the scene receded quadrangularly; still, however, with less depth than breadth: the space thus comprised was called the *proscenium*. The remaining part of the logeum, to the right and left of the scene, had, both in front on the verge of the orchestra, and at the back, a wall entirely plain, or at most architecturally ornamented, which rose to the level of the uppermost seat for the spectators.

The decoration was so contrived that the principal object in front covered the back-ground, and the prospects of distance were given at each side, which is just the reverse of the mode adopted on the modern stage. This was done according to certain rules: on the left appeared the town to which the palace, temple, or whatever occupied the centre, belonged; on the right was the open country, landscape, mountains, sea-shore, &c. The lateral decorations were three-sided constructions turning on a pivot fixed underneath, by which means the changes of scene were partly effected. In the back decoration it is probable that many things were exhibited substantially which with us are only painted. When a palace or temple was represented, there appeared in the *proscenium* an altar, which answered a number of purposes in the course of the performance. The central decoration was most frequently architectural, though sometimes it was a painted landscape; and from a passage of *Plato* it seems clear that the Greeks must have carried theatrical perspective to very considerable perfection.

In the back wall of the scene were a large main entrance and two side ones; and as the hinder decoration was generally a palace in which the principal characters of royal descent resided, they naturally came through the great door, and the servants made their entrance from the wings. There were two other entrances; one at the end of the logeum, whence the inhabitants of the town came; the other in the orchestra below for characters who were supposed to come from a distance; they ascended the logeum by a staircase from the orchestra which was applicable to a variety of purposes, as circumstances required. The situation of these several entrances explains many passages in the ancient dramas, where the persons standing in the middle see some one advancing long before he comes near them. Beneath the seats of the spectators a stair was somewhere constructed through which the spectres of the departed, unperceived by the audience, ascended into the orchestra, and thence, by the staircase above mentioned, made their appearance on the stage. The nearest verge of the logeum sometimes represented the sea-shore. The Greeks were well skilled also in availing themselves, for scenic effect, even of what lay beyond the decorations: the frequent addresses to heaven were doubtless directed to the actual skies; and it was a general principle with them that everything imitated on the stage should, if possible, consist of actual representation; and only where this could not be done were they content with a symbolical exhibition. The machinery for the descent of gods to the earth or the withdrawing of men from it, was placed aloft behind the wall at each side of the scene, and so removed from the sight of the audience. There were hollow places beneath the stage, and contrivances for thunder and lightning, for the apparent fall or burning of a house, &c. An upper story could be added to the farthest wall of the scene, when it was necessary to represent a tower having an extensive prospect, &c. The encyclema was a machine semicircular within, and covered above, which represented the objects contained in it as in a house: this could be thrust behind the great middle entrance; and we find it to have been so used for the production of a grand theatrical effect; the central entrance being then left open to exhibit the interior to the audience. A stage curtain is mentioned both by Greek and Roman writers; indeed its Latin appellation, *auleum*, is borrowed from the Greeks: it seems, however, not to have been in use in the earlier period of the Attic theatre; and when brought into use, it covered, not the whole length of the logeum, but only the comparatively small front of the *proscenium*.

The entrances for the chorus were beneath, in the orchestra, in which it generally remained, and in which it performed its solemn dance, moving round first in one direction, then in the other, during the choral songs. In front

of the orchestra, opposite to the middle of the scene, was an elevation with steps, resembling an altar, raised to the level of the stage, and called the thymele. This was the station of the chorus when it did not chant, but was taking an interest in the action. The leader of the chorus then took his or her station on the top of the thymele, to see what was passing on the stage, and to communicate with the characters. For though the choral song was common to the whole, yet when it entered into the dialogue, one of its number spoke for the rest, which accounts for the changing from the plural number to the singular, and *vice versa*, in addressing them from the stage. The thymele was situated precisely in the centre of the building, and all the measurements were calculated from that point.

It is plain that the Grecian theatre, both in its architectural and its scenic arrangements, must have attained much higher perfection in the course of that illustrious period of Grecian art which we are accustomed to denominate, from its most characteristic and influential name, the age of Pericles, than it had reached at the termination of the dramatic career of Æschylus. The very building itself, which in the general and splendid restoration of Athens after the termination of the Persian war was reconstructed of massive stone, was originally of timber only. But as Æschylus was no less the creator of the theatre in all its essential parts than he was of the dramatic action itself, we have deemed this the fittest place in which to give some general notion of its structure and disposition.

Excepting only 'The Persians,' interesting rather as an historical than as a dramatic monument, the subject of each of the pieces of Æschylus that remain to us is either purely mythological, or taken from those traditions of the later heroic ages in which fable bears so large a part, or compounded from both those sources. In dealing with mythology (that is, as we have already requested the reader to bear steadfastly in mind, with the mystical personages immemorially fixed in the religious belief of his countrymen), Æschylus, like our own Milton, and, indeed, partly showing Milton the way, seems to have delighted to launch his imagination into that boundless and mysterious field which, according to the notions of antiquity, lay beyond and above the existence of even the greatest and the oldest of the Olympian deities. The dimness and vagueness of the prevailing ideas respecting those primeval powers of nature afforded the freest scope for the development of his most gigantic conceptions; and in that highest range of the mythological drama he found among the antients neither rival nor competitor. Above all, the opposition between inexorable fate and unconquerable will,—the only effectual shield, that of invincible fortitude, presented by a finite being against all that the awful and inevitable course of universal nature can inflict,—such appears to have been his favourite subject of contemplation. The sole mastery which he possessed in this sublime walk of tragedy demands that we should endeavour to present a more precise idea of his mode of applying such materials to the purposes of the drama. We shall therefore give a brief account of that one of his remaining pieces which most completely illustrates these peculiar powers of the great tragedian. This we shall do in the words of the eminent dramatic lecturer whom we have already repeatedly quoted; after first remarking that 'Prometheus Chained,' the tragedy in question, held a connected place between two others entitled 'Prometheus the Fire-bringer,' and 'Prometheus Loosed,' of both of which the Greek originals are lost, although a considerable fragment of the latter has come down to us in a Latin translation.

'The Chained Prometheus,' says Schlegel, 'is the representation of constancy under suffering, and that the never-ending suffering of a god. Exiled to a naked rock on the shore of the encircling ocean, this drama still embraces the world, the Olympus of the gods, and the earth of mortals, all scarcely yet reposing in a secure state above the dread abyss of the dark Titanian powers. The idea of a self-devoting divinity has been mysteriously inculcated in many religions, as a confused foreboding of the true: here however it appears in a most alarming contrast with the consolations of revelation. For Prometheus does not suffer on an understanding with the power by whom the world is governed; on the contrary, he atones for his disobedience, which disobedience consists in nothing other than an attempt to give perfection to the human race. . . . There is little external action in this piece. Prometheus merely

suffers, and resolves from the beginning to the end, and his sufferings and resolutions are always the same. But the poet has contrived in a masterly manner to introduce variety and progress into that which in itself was determinately fixed, and given us a scale for measuring the matchless power of his sublime Titans in the objects by which he has surrounded them. We have first the silence of Prometheus while he is chained down under the harsh inspection of Strength and Force, whose threats serve only to excite a useless compassion in Vulcan, who carries them into execution; then his solitary complaints; next, the arrival of the tender ocean nymphs, whose kind but disheartening sympathy induces him to give vent to his feelings, to relate the cause of his fall, and to reveal the future, though with prudent reserve he reveals it only in part; the visit of the ancient Oceanus, a kindred god of the race of the Titans, who, under pretext of a zealous attachment to his cause, advises him to submission towards Jupiter, and is on that account dismissed with proud contempt; the introduction of the raving Io, driven about from place to place, a victim of the same tyranny from which Prometheus suffers; his prophecy of the wanderings to which she is still doomed, and the fate which at last awaits her, connected in some degree with his own, as from her blood he is to receive a deliverer after the lapse of many ages; the appearance of Mercury as the messenger of the tyrant of the world, who, with threats, commands him to disclose the secret by which Jupiter may remain on his throne secure from all the malice of fate; and lastly, the yawning of the earth before Prometheus has well declared his refusal, amid thunder and lightning, storm and earthquake, by which he himself, and the rock to which he is chained, are swallowed up in the abyss of the nether world. The triumph of subjection was never celebrated in more glorious strains; and we have difficulty in conceiving how the poet, in the 'Prometheus Loosed,' could sustain himself on such an elevation.'

This and all the other remains of Æschylus that we possess concur to testify that it was his usual practice to compose three tragedies in connection with each other, and of which the first and second, at their conclusion, manifestly referred to the one which was to follow. This must be carefully borne in mind in judging of any of the four single pieces that have come down to us, detached in each instance from the two other tragedies which originally combined with them to form a dramatic whole. Only one of these trilogies, as they were sometimes called, has descended to us complete; and from this alone it is that we can venture to judge as to the full extent of the powers of Æschylus in the general conception and arrangement of a great dramatic composition. Fortunately, we have every reason to regard this threefold tragedy as the most mature and perfect of all his productions: he was sixty-seven years of age when he brought these dramas on the stage, the last which he ever submitted in competition for the prize at Athens. These three pieces are, 1, 'Agamemnon'; 2, the 'Choëphoræ,' or Libation-bearers; 3, the 'Eumenides,' or Furies.

In this triple drama, or *Orestiad*, as it has sometimes been called, we have the noblest display of that fervent character of religion, poetry, and patriotism, which so strongly distinguished the earlier Grecian tragedy; while, considering it simply as a production of art, the sublime retrospect which in the first part is cast over the war of Troy, its occasion, and its catastrophe—the terrible chapters which are next unfolded to us of the domestic horrors entailed upon the house of Pelops—and the concluding glory which is cast around the tutelary goddess and guardian institutions of the poet's native country, furnish a series of scenes and of strains which, for severe grandeur, relieved by majestic beauty, have rarely been equalled—never, we believe, surpassed.

The historical relation in which Æschylus stood to Sophocles enabled the latter to avail himself of the inventions of the former. 'The more artful construction of the dramas of Sophocles,' observes Schlegel, 'is easily perceived; the limitation of the chorus with respect to the dialogue, the polish of the rhythmus, and the pure Attic diction; the introduction of a greater number of characters; the increase of contrivance in the fable; the multiplication of incidents; a greater degree of development; the more tranquil continuance of all the movements of the action; the greater degree of theatrical effect given to incidents of a decisive nature; and the more perfect rounding of the whole, even

considered in a merely external view.... To characterize the native sweetness and affection so eminent in this poet, the ancients gave him the appellation of the Attic Bee. Whoever is thoroughly imbued with the feeling of this property may flatter himself that a sense for ancient art has arisen within him; for the affected sentimentality of the present day, far from coinciding with him in this opinion, would, both in the representation of bodily sufferings and in the language and economy of the tragedies of Sophocles, find much of an insupportable austerity.

It was indeed this thorough yet noble harmony of all his qualities, this dignified sweetness, that made Sophocles the favourite poet of the age of Pericles, to which we must observe, that the formation of the mind of Æschylus was just anterior. It was natural that the martial spirit of the warrior of Marathon should appear in his compositions with even more prominence than the calls of poetry strictly demanded; and thus it was remarked in his own age, in relation to one of his still existing pieces, the 'Seven Chiefs against Thebes,' that it was inspired by Mars rather than Bacchus. But with Sophocles the poetical vocation had predominated from the first, and occupied him during the whole of a lengthened and tranquil life. Grace, in the most refined sense of the term, is his grand distinction; but in boldness and comprehensiveness he was decidedly inferior to the mighty master who preceded him. The traditions respecting the Trojan war, and the tragic histories of the royal houses of Thebes and Mycenæ, furnished the principal themes to Sophocles, as they had done to Æschylus; and the 'Electra' of Sophocles, wherein he treated the same subject as Æschylus in the 'Choephore,' fortunately remains to enable us to make a very exact comparison between the genius and style of the two poets.

We shall add but one concluding remark on these two great masters of the elder Grecian tragedy. The tendency of the genius of Æschylus in framing his great dramatic compositions was manifestly to embrace in the first instance a vast field of incident and invention, and reduce it to poetic order; while that of the mind of Sophocles was, to fix upon some given point of historic or mythologic interest, and, taking that as a nucleus, to expand it into poetic form. Æschylus was above all things a creator; Sophocles, a cultivator and adorer. The passion of the latter was more for the beautiful, that of the former for the sublime; but though Æschylus took the loftier and more adventurous flights, both moved in the elevated region of the ideal.

In characterizing the third great master of Grecian tragedy, we must take a course which we believe to be more conformable to reason, as well as more favourable to his genius than that adopted by many critics ancient as well as modern, and among the latter by Schlegel himself. It is not fair, merely because Euripides necessarily treated these mythological subjects which were the common stock of the poets of his age, to force a strict parallel between himself and the tragic poets who preceded him. His mental training belonged to a later period of Athenian history and taste, and he possessed a genius essentially different from that of his predecessors, yet a genius assuredly great and rich. Sophocles, indeed, may justly be said to have belonged to the school of Æschylus; but Euripides was the founder of a dramatic school entirely new, and so was certainly more original than Sophocles, though moving, in one sense, in an inferior poetic sphere. That he not only did not pourtray mere men and women sufficiently according to the ideal standard, but that he drew down his demigods and his deities themselves to the level of human nature, seems to have been the gravest charge brought against Euripides in his own time by such as were attached exclusively to the ideal school of tragedy. But for these reproaches he was amply indemnified by the approbation and sympathy of the greater portion of the Athenian public. The great ideal representations to which they had previously been accustomed had, indeed, drawn abundantly on their admiration; but their sympathies had yet to be vividly and intimately stirred. This the habits and temper of Euripides inclined him to attempt, and this he successfully accomplished: nor need we wonder that, striking thus directly at the hearts of his auditory, he should have risen to share the public favour equally with Sophocles during the later part of the career of the latter, although, from the essential difference between their characteristic excellencies, there was no absolute competition between them. As nothing seems calculated to mark so distinctly the characteristic differences in the

genius of great artists as an examination of their respective modes of treating one and the same subject; as the remarkable incident in the sanguinary annals of 'Pelops' line,' on which we have already had occasion to dwell, has been fated, as we shall see, to stand so prominently forward in the scrolls of modern as well as ancient tragedy; and as the 'Electra' of Euripides remains to us among his extant pieces, we recommend it particularly to the attention of those readers who may find leisure for such examination, because, though far from being one of the finest of his remaining productions, it offers the best means of contrasting his dramatic character with the very different one of Sophocles.*

We shall, perhaps, form the best idea of the old Grecian comedy by considering it as a complete contrast to the ideal tragedy. Although the old comic writers gave the names of existing persons to their characters, they did not exhibit them on the stage with all the circumstances peculiar to certain individuals; for such historical characters have always with them an allegorical signification; they represent a class; and as their features were exaggerated in the masks, so their characters were overcharged in the composition. Still this constant allusion to the nearest reality, which not only allowed the poet, in the character of the chorus, to converse with the public in a general way, but also to point at certain individual spectators, is of essential import in any view of this species of composition. As the spirit of the elder tragedy delighted in harmonious unity, the old comedy, on the contrary, flourished in a chaotic exuberance, seeking out the most glaring and diversified objects, the most strongly marked oppositions, working up the most singular, unheard-of, and even impossible adventures, with the local peculiarities nearest at hand. The comic poet, indeed, as well as the tragic, transported his characters to an ideal element; not, however, to a world subjected to necessity, but to one where the caprice of an inventive wit prevails without restraint, and all the laws of reality are suspended.

Comedy, in the hands of its Doric founder Epicharmus, borrowed its materials chiefly from the mythical world. Nor in its maturity did it altogether relinquish that field, as appears from the titles of many of the lost pieces of Aristophanes and his contemporaries. But as a violent contrast between the materials and the form is here quite appropriate, the subjects of the old comedy were naturally drawn from the most serious concerns of public life and the state: the private and family life was only introduced occasionally, and indirectly, with a reference to the public. The chorus, besides that it was essential to the complete parody of the tragic form, also contributed to the expression of that festal gladness of which comedy was the most unrestrained effusion; for, as already observed, in all the popular and religious festivals of the Greeks, choral songs were chanted, accompanied by dancing. On some of these occasions we find in the comic chorus such a display of sublime lyrical poetry that the passages might be transferred to tragedy without alteration. It is, however, one deviation from the tragic model, that often there are several choruses in the same comedy, who at one time all sing together and in opposite positions, and at other times change with and succeed each other without any general reference. But the most remarkable peculiarity of the comic chorus is the *parabasis*, an address by the chorus to the spectators, in the name and under the authority of the poet, which has no immediate concern with the subject of the piece. Herein he sometimes enlarges on his own merits, and ridicules the pretensions of his rivals; at other times he avails himself of his privileges as an Athenian citizen, to deliver proposals of a serious or a ludicrous nature for the public good. The parabasis may have owed its invention partly to the circumstance of the comic poets not having such ample materials as the tragic to fill up the intervals of the action, when the stage was empty, with affecting and inspired poetry. But this very departure from the strictness of dramatic form is consistent with the essence of the old comedy; just as an individual, while wearing a droll disguise may, in the same spirit of drollery, venture occasionally to put aside the mask.

Of the Grecian comic writers of the old kind there is but one of whom any work has descended to us, so that in judging of his merits we can have no aid from comparison with other masters. Aristophanes had many predecessors,

* For some remarks on the Satiric Drama, the reader is referred to the article EURIPIDES.

Magnes, Cratinus, Crates, and others; he was indeed one of the latest comic authors of that school, as he survived even the old comedy itself. This writer, the very singularity of whose escape from the general wreck of the elder comic productions renders him so interesting and valuable to the history of dramatic art, has been very erroneously judged of in latter times, owing to two capital defects in the mode in which modern criticism has been applied to him, viz., the want of sufficiently understanding the spirit of Athenian society of that day in general, and yet more, the want of a just view of what constituted the essential character of the old comedy itself. It cannot be too repeatedly urged upon the attention of modern critics that an author must be judged with reference to all the circumstances, not which surround his modern censor, but which surrounded the author himself. It is much more reasonable to make use of the works of Aristophanes as a serious study of some remarkable features in the character of his age, than to cast them angrily aside, on the mistaken inference that because they contain much that is either disgusting or monstrous to modern taste, Aristophanes himself must have been a disgrace and a nuisance to any cultivated age.

This writer, too, is precisely one of those of whose qualifications and peculiarities it is most difficult to acquire an accurate notion without reading him in his original language. His diction is extremely elegant, displaying the purest Atticism, and accommodating itself with the greatest pliability to every tone, from the most familiar dialogue to the lofty elevation of the dithyrambic ode. His general elegance of language is found the more attractive from the contrast which he occasionally displays; for he not only indulges sometimes in the rudest popular expressions, in foreign dialects, and the mutilated articulation of the Greek in the mouths of barbarians, but extends the same arbitrary power which he exercised over nature and human affairs to language itself, and by new compounds, allusion to names of persons, or imitation of particular sounds, produces words of the most singular description.

'As Aristophanes,' says Schlegel, 'appears to me to have displayed, in the exercise of his separate but infinitely varied art, the richest development of almost every poetical property, whenever I read his works, I am equally astonished at the extraordinary qualifications which they suppose his spectators to have possessed. We might expect from the citizens of a popular government an intimate acquaintance with the history and constitution of their country, with public events and transactions, with the peculiarities of all their contemporaries of any note or consequence. But Aristophanes also supposes his audience to have possessed an extensive acquaintance with the mechanism of poetry; and, to understand his parodies, they must have had almost every word of the tragical masterpieces by heart. And how quick of apprehension they must have been to catch, in such rapid flight, the lightest and most complicated irony, the most unexpected sallies and unusual allusions, denoted often by the mere inflexion of a syllable! We may boldly affirm, that notwithstanding all the explanations that have come down to us, notwithstanding the accumulation of learning that has been displayed, one half of the wit of Aristophanes is altogether lost to the moderns. These comedies, which, amidst all their farcical peculiarities, display the most extensive knowledge of human life, could only, as a source of popular amusement, be properly understood and appreciated by the incredible acuteness and vivacity of the Attic intellect. We may envy the poet who could reckon on so clever and accomplished a public; yet this was in truth a very perilous advantage: auditors whose understandings were so quick would not be easily pleased. Aristophanes complains of the excessively fastidious taste of the Athenians, with whom the most admired of his predecessors were immediately out of favour when the smallest symptom of a falling off in their mental powers was perceivable. At the same time he allows that the other Greeks bore not the slightest comparison with them in a knowledge of the dramatic art. All the talents of Athens strove to excel in this department; and the competition was limited to the short period of a few festivals, during which the people always expected a succession of novelties. The distribution of the prizes (on which all depended, as there was no other remaining notification of the public opinion) was determined by a single representation. We may easily imagine to what perfection this representation would attain under the directing care of the poet. If we also take into

consideration the high state of the tributary arts, the utmost distinctness of delivery of the most finished poetry, both in speaking and singing, with the magnificent extent of the theatre, we shall then have some idea of a theatrical enjoyment which has never in an equal degree been since known in the world.'

The old critics were of opinion that Cratinus was powerful in living satire and direct attack, but was deficient in a pleasant humour, in the talent of developing his subject advantageously, and filling up his pieces with the necessary details; that Eupolis was agreeable in his jocularities, and skilful in the use of ingenious allusions and contrivances, so that he never even needed the aid of the parabasis to say whatever he chose, but that he wanted satirical force; that Aristophanes united the powers of both those writers, and that in him we have satire and pleasantry combined in the most perfect and attractive manner. But one of the most honourable testimonies in this dramatist's favour is that of no less an authority than the sage Plato himself, who, in an epigram, says that the Graces would have selected his mind for their dwelling-place, who constantly read him, and who transmitted his comedy of 'The Clouds' to Dionysius the Elder, with the remark that from that play (which, be it remembered, contains the imputedly murderous attack on Plato's master, Socrates) Dionysius would be able to acquaint himself with the state of Athens.

Towards the end of the Peloponnesian war, when a few individuals, violating the constitution, had assumed supreme authority in Athens, a law was enacted empowering any person attacked by comic poets to bring them to justice; and a prohibition was issued against introducing real persons on the stage, or using masks which bore a resemblance to their features, &c. This measure put a violent and final termination to the genuine old comedy. For a short time after, the endeavour was made to continue the existence of this ideal species under the political restrictions thus imposed: but these shackles were soon found to be fatal to its spirit and popular attractiveness; and this transitional kind, which has since been commonly designated as the middle comedy, soon gave way to the introduction of the new comedy, which, like the later Greek tragedy already mentioned, aimed at presenting a poetic mirror of actual life.

It has been almost universally the practice of modern writers on this subject to cite the testimony of Horace (*Ad Pisones*, vv. 281-284), as decisive evidence of the justice and necessity of this suppression of the political spirit of the elder Grecian comedy. But we must not forget that Horace, living easily and contentedly under a virtual despotism, erected too, like the very power which put down the old comedy, on the ruins of a republican constitution, could have little sympathy with that broadly democratic spirit which pervaded every public institution of Athens, and was little qualified to judge impartially respecting any one of its developments. The old comedy flourished during the existence of the Athenian liberty; both were oppressed under the same circumstances and by the same persons. It was under the very same violent usurpation of power that the sportive censure of Aristophanes was reduced to silence, and the grave animadversions of Socrates were punished with death. As for the alleged persecution of the latter by Aristophanes, besides that 'The Clouds' was composed many years before the philosopher's condemnation, we do not find that the like attacks did any harm to Euripides: the people of Athens beheld with admiration the tragedies of this friend of Socrates, and the parodies of them by Aristophanes, exhibited on the same stage. Nor can we too often repeat that notwithstanding the strong political tincture which, amidst a society like the Athenian, the unbounded license essential to the old comedy necessarily acquired, yet, from first to last, its primary aim was not so much effectiveness in satire as it was sublimity in the burlesque.

Although the new comedy developed itself only in the brief interval between the end of the Peloponnesian war and the first successors of Alexander the Great, yet the stock of pieces in this kind amounted to some thousands: time, however, has made such ravage among them that nothing remains to us but a number of detached fragments in the original language, often so disfigured as to be unintelligible, besides about twenty translations or copies of Greek originals in Plautus and six in Terence. Among the Grecian masters, Diphilus, Philemon, Apollodorus, and Menander, are four of the most celebrated names. The palm for ele-

gance, delicacy, and sweetness, is universally yielded to Menander, who was contemporary with Demetrius Phalereus. Though instructed in philosophy by Theophrastus, his inclinations led him to the doctrines of Epicurus; and he boasted in an epigram, that 'if Themistocles freed his country from slavery, Epicurus freed it from irrationality.' Indeed, the Epicurean philosophy, which placed the highest felicity of life in the benevolent affections, neither inciting men to heroic action nor allowing them to feel the want of it, could hardly fail to be well received among the Greeks after the loss of their old and glorious freedom. We may likewise easily understand why they conceived a passion for the new comedy at the very period when they lost their liberty, seeing that it drew their attention from political transactions and human affairs at large, and absorbed it wholly in the considerations of personal and domestic interests.

The Greek theatre, as we have seen, was originally constructed for the exhibition of the higher walks of the tragic drama: its stage was open to the sky, and exhibited but little of the interior of the houses. Comedy was therefore under the necessity of laying the scene out of doors; and had often to make people come out of their houses to confide their secrets to each other in the streets. It is true that the poets were thus spared the necessity of changing the scene, as it was taken for granted that the families concerned in the action lived in the same neighbourhood; besides that the Greeks, like all other southern nations, lived much more in the open air than we do. The chief disadvantage in this construction of the stage is, the circumscription of the female parts. If the actual manners were to be observed, as the essence of the new comedy required, the secluded life of the fair sex in Greece rendered the exclusion of unmarried women, and of young women in general, inevitable. No females could appear but aged mothers, maid-servants, or courtizans. Hence, besides the necessary sacrifice of so many agreeable situations, this other inconvenience is produced, that the whole piece frequently turns on a marriage with or a passion for a young woman whom the audience never once see from the beginning to the end of it.

Athens, where the fictitious as well as the actual scenes were generally placed, was the capital of a small territory, and inferior to our principal modern cities in extent and population. The republican equality admitted no marked distinction of ranks: all were alike citizens, richer or poorer. Hence the Attic comedy could admit but little of those contrasts arising from diversity of tone and cultivation which appear in those modern comedies wherein the manners of a court and the refinement or corruption of a monarchical capital are portrayed.

As regards the relations between the two sexes, the Greeks had nothing resembling either the gallantry of modern Europe, or the union of love with enthusiastic and respectful admiration. All ended in sensual passion or in marriage. The latter, by their constitution and manners, was a matter much more of duty or convenience than of inclination. The society of a wife, who frequently had not been once seen before marriage, and had passed all her previous life within the walls of a house, proving no great source of entertainment, the latter was sought among women entitled to less ceremony, and who were generally either foreigners without property or emancipated slaves. The indulgent morality of the Greeks permitted almost every degree of freedom with women of this description, especially in the case of young and unmarried men; and consequently the old comic writers exhibit this kind of life very undisturbedly. Their comedies often end with a marriage—a catastrophe which, according to Schlegel, 'seems to bring seriousness along with it;' but with them marriage is frequently nothing more than a means of reconciliation with a father for the irregularities of a forbidden amour: sometimes, however, it happens that the amour is turned into a lawful marriage by a discovery that the woman supposed to be a foreigner or slave was by birth an Athenian citizen. From all the circumstances we have stated, it will appear little surprising that the poets of the later Grecian comedy had so small a circle of characters at their disposal: we enumerate the principal in the words of Schlegel:—The austere and frugal or the mild and yielding father, the latter not unfrequently under the dominion of his wife, and making common cause with his son; the housewife, either loving and sensible, or obstinate, domineering, and proud of the accession brought by her to the family property; the

young man, giddy and extravagant, but open and amiable, who, even in a passion, sensual at its commencement, is yet capable of true attachment;—the vivacious girl, who is either thoroughly depraved, vain, cunning, and selfish, or still well disposed, and susceptible of higher emotions;—the simple and boorish slave, or the cunning one, who helps his young master to deceive his old father, and obtain money by all manner of devices, for the gratification of his passions;—the flatterer or accommodating parasite, who, for the sake of a good meal, is ready to say or do anything that may be required of him;—the sycophant, whose business it was to set quietly disposed people by the ears, and stir up law-suits, to conduct which he offered his services;—the braggart soldier returned from foreign service, generally cowardly and simple, but assuming airs from the fame of his foreign achievements;—a female servant or pretended mother, who preaches a bad system of morals to the girl entrusted to her guidance;—and lastly, a slave-dealer, who speculates on the extravagant passions of young men.' The cunning servant is usually also the buffoon, who confesses his own sensuality and want of principle with a kind of self-complacent exaggeration, jests at the expense of the other characters, and even occasionally addresses the audiences. We must not, however, forget that the Greek servant was a slave exposed for life to the arbitrary caprice of his master, and often subjected to the severest treatment; so that cunning was his natural weapon of defence, and artifice his habitual practice.

It is remarkable that while in other respects the new comedy approached so much nearer to real life than the old, yet the masks in the former deviated farther from reality than in the latter, were more overcharged in the features, and bore a greater resemblance to caricature. It would seem that, as the dramatists were now forbidden to exhibit portraits of real persons on the stage, they were always in fear of stumbling accidentally upon some such resemblance, especially to any of their Macedonian rulers, and so endeavoured in this way to obviate all such danger. Yet the exaggeration in question would hardly be without its peculiar meaning; and accordingly we find it stated that an unequal profile, with one eyebrow drawn up and the other down, was expressive of useless and meddling activity; as, indeed, it is observable that persons accustomed to look at things with anxious minuteness are apt to acquire such distortions.

Though confined in their choice of subject to the narrow range of their civil and domestic life, the inventive genius of the Greek comic writers contrived to exhibit a wonderful variety in their productions: yet in the selection and arrangement of their incidents they were ever true to their national manners and circumstances. As Greece consisted of a number of small separate states lying near and round one another, on sea-coasts and islands, navigation was general, piracy frequent, and human beings were thus procured for the supply of the slave trade. Freeborn children were liable either to be carried off from their parents, or to be exposed by them, by virtue of the legal right which they possessed, and in some cases would be unexpectedly saved from perishing or delivered from captivity, and so recovered by their parents: here we see the groundwork of the numerous recognitions between parents and children, brothers and sisters, &c., which appear in the later Grecian comedy.

The writers in this walk employed themselves, too, on all the subordinate departments,—the farce, the piece of intrigue, the various gradations of pieces of character, from caricature up to the most refined species, and even the serious or sentimental drama. We find also, from the titles of the pieces, and other circumstances, that they sometimes introduced historical persons, as the poetess Sappho for instance, representing the love of Alcæus and Anacreon for her, and hers for Phaon; and we may well suppose that this occasional mixture of beautiful passion with the tranquil grace of the ordinary comedy was exceedingly attractive.

The Romans, whose drama immediately follows that of the Greeks, were not led to the invention of theatrical amusements from the want of representations to fill up the leisure of their festivals, and enliven the mind by withdrawing it from the concerns of life; but, in the despondency of a desolating pestilence, against which all remedies seemed insufficient (year of Rome, 391), they had, according to the story, recourse to the theatre as a means of appeasing the anger of the gods, having previously been acquainted only with gymnastic exercises and circus races. The *histriones*,

for whom they sent to Etruria, were however merely dancers, who probably did not attempt pantomimic movements, but strove to delight their audience by a display of bodily activity. The oldest spoken plays, the 'Fabulæ Atellanæ,' were borrowed by the Romans from the Osci, the indigenous inhabitants of Italy. [ATELLANÆ.] They were satisfied with these amusements till Livius Andronicus, somewhat more than five hundred years after the foundation of Rome, began the imitation of the Greeks; and the regular compositions of tragedy and the new comedy (the old it was impossible to transplant) were then, for the first time, known in Rome. Thus the Romans owed the first idea of a play to the Etrurians, the effusions of a sportive humour to the Oscans, and the higher class of dramatic productions to the Greeks. They displayed, however, more originality in the comic than in the tragic department.

The Romans had, besides, their peculiar *mimi*. Their foreign name for these small pieces might lead us to conclude that they bore a great affinity to the Greek *mimi*: however, they differed considerably in form: we know also that the manners portrayed in them had a local truth, and that the subject was not derived from Grecian compositions. The later Greek *mimi* were dialogues in prose, yet written with a kind of rhythm, not designed for the stage; the Roman were in verse, were represented, and often delivered extempore. Their most celebrated authors in this way were contemporary with Julius Cæsar. These were, Laberius, a Roman knight, and P. Syrus, his freedman and scholar in the mimetic art. Not one of these compositions has descended to us entire. We have, however, a number of sentences from the *mimi* of Syrus, which, from their internal worth and elegant conciseness of expression, deserve to rank with those of Menander. One entire *mimus*, which unfortunately time has not spared for us, would have thrown more light upon the question than all the confused accounts of the grammarians, and all the conjectures of modern scholars.

The regular comedy of the Romans was for the most part *palliata*, that is, it appeared in a Grecian dress, and represented Grecian manners. This is the case with the whole of the comedies of Plautus and Terence. But they had also a *comædia togata*, so called from the Roman dress which was worn in it. Afranius is celebrated as the principal writer in this department. We have no remains whatever of him; and the accounts of the nature of his works are so very scanty, that we cannot even determine, with certainty, whether the togates were original comedies of an entirely new invention, or merely Greek comedies adapted to Roman manners. The latter supposition is the more probable, as Afranius lived in a period when the Roman genius had not yet attempted to soar on the wings of original invention; and yet we cannot well conceive the possibility of adapting Attic comedies, without the most violent constraint, to local circumstances of so very different a nature. The Roman way of living was in general serious and grave, though in private society they showed a great turn for wit and joviality. The diversity of ranks among them was politically marked in a very decided manner, and the wealth of private individuals was frequently not inferior to that of sovereigns: women lived much more in society, and acted a much more important part than among the Greeks, through which independence they fully participated in the overwhelming tide of corruption, and the external refinement by which it was accompanied. With these essential differences in the social system, an original Roman comedy would have been a most interesting phenomenon, and would have enabled us to view those conquerors of the world under an aspect altogether new. That this however was not accomplished in the *comædia togata*, the indifferent manner in which it is mentioned by the ancients will hardly leave us room to doubt. Quintilian himself tells us in plain terms that the Latin literature was lamest in comedy.

It remains to say a few words of Terence and Plautus, of whom alone, among the Roman comic writers, we have any perfect remains. Among the Greeks, the poets and artists lived at all times in the most honourable social relations. Among the Romans, on the contrary, polite literature was at first cultivated by men of the lowest class, by indigent foreigners, and even by slaves. Plautus and Terence themselves, who lived about the same period, towards the end of the second Punic war, and in the interval between the second and third, were of the lowest rank; the former a poor day-labourer, the latter a Carthaginian slave,

and afterwards a freedman. Their fortunes and associations however were very different. Plautus, when he was not composing comedies, was under the necessity of working at a hand-mill for subsistence; while Terence was admitted into familiar intimacy with the elder Scipio and his bosom friend Lælius. The different habits of life of the two dramatists distinctly appear in their respective modes of writing; the bold roughness of Plautus, and the coarse originality of his jests, betray his intercourse with the lower orders; while in Terence we discern the tone of good society. Plautus inclines to the exaggeratedly droll and farcical; Terence prefers the delicately characteristic, and approaches the seriously instructive and the sentimental. Some of the pieces of Plautus are taken from the Grecian comic writers Diphilus and Philemon, whom we have already had occasion to mention among those of whose works only fragments remain: there is little doubt however that he added much of his native coarseness to his originals. From whom he derived the other does not appear; except, as Schlegel remarks, we may consider ourselves warranted by the assertion of Horace, 'It is said that Plautus took for his model the Sicilian Epicharmus,' in conjecturing that he borrowed his 'Amphitryo,' a piece of quite a different kind from the others, and which he himself calls a *tragi-comedy*, from that old Doric writer, who employed himself chiefly on mythological subjects. Among the plays of Terence, whose copies from the Greek are probably much more faithful in details than those of Plautus, we find two taken from Apollodorus, and the rest from Menander. Julius Cæsar bestowed some verses of his own composition upon Terence, wherein he pays him the rather equivocal compliment of calling him a half Menander; praising the elegance of his style, and only regretting that he falls short of the comic strength of his original.

With respect to tragedy, it must first of all be observed that the Grecian theatre was not introduced into Rome without considerable changes in its arrangement; that the chorus no longer had a place in the orchestra (wherein the most distinguished spectators, the senators and knights, now sat), but remained on the stage itself. At the very introduction, too, of the regular drama, Livius Andronicus, a Grecian by birth, and the earliest tragic poet and actor of Rome, in the monodies (lyrical pieces chanted by a single person, and not by the chorus), separated the singing from the mimetic dancing, so that the latter alone remained to the actor; and instead of the former, a boy stood beside the flute-player, and accompanied him with his voice. Among the Greeks in better times, the tragic singing and the accompanying rhythmical gestures were so simple, that one person was sufficient to do at the same time the most ample justice to both. The Romans, however, it would seem, preferred separate skill to harmonious unity. Hence arose their fondness, at an after period, for pantomimes, of which the art was, in the time of Augustus, carried to the greatest perfection. From the names of the most celebrated of the performers, Pylades, Bathyllus, &c., it would appear that those who practised this mute eloquence in Rome were Greeks; and the lyrical pieces which their dancing expressed were also delivered in the Grecian language. Roscius frequently played without a mask, and in this respect probably did not stand alone; but so far as we know, there never was any such instance among the Greeks.

In the tragic literature of the Romans there are two epochs: the first is that of Livius Andronicus, Nævius, Ennius, and also of Pacuvius and Attius, who both flourished somewhat later than Plautus and Terence; and the second, the refined epoch of the Augustan age. The former produced only translators and imitators of Greek models; but it is probable that they succeeded better in tragedy than in comedy. Elevated expression usually appears rather stiff in a language not sufficiently cultivated, although it is attainable by perseverance; but to catch the negligent grace of social railery, we must ourselves be possessed of humour and refinement. Here, however, as in the case of Plautus and Terence, we have not a single fragment of the Greek originals to enable us to judge of the accuracy and general felicity of the copies; but a speech of considerable length of the 'Freed Prometheus' of Attius is hardly unworthy of *Æschylus*, and is also, in versification, much more polished than the productions of the Latin comic writers generally are. This earlier style was carried to perfection by Pacuvius and Attius, whose pieces kept

their place on the stage, and seem to have had many admirers down to the time of Cicero, and even later.

The contemporaries of Augustus were ambitious of measuring their powers with the Greeks in a more original way. The number of amateurs who attempted to shine in tragic composition was particularly great; and we find mention made even of works of the emperor himself. Hence there is strong reason for supposing that Horace wrote his epistle to the Pisos chiefly with a view to deter those young men from so dangerous a career, as they were probably infected by the prevalent literary passion without possessing the requisite talents. One of the most renowned tragic poets of that age was Asinius Pollio, a man of impassioned disposition, as Pliny informs us, and who, in plastic works, was fond of whatever bore the same character. It was he who brought with him from Rhodes the well-known group of the Farnesian Bull, and erected it at Rome. 'If,' observes Schlegel, 'his tragedies bore the same relation to those of Sophocles which this bold, wild, and rather extravagant group does to the tranquil grandeur of the Niobe, we have every reason to regret their loss.' But the political importance of Pollio might easily bias the judgment of his contemporaries as to the value of his poetical labours. Ovid, who tried so many departments of poetry, likewise attempted tragedy, and was the author of a 'Medea;' and Quintilian asserts that he proved here, for once, what he could have done had he chosen to restrain himself, instead of yielding to his natural propensity to diffuseness.

These and all the other tragic attempts of the Augustan age have perished. Yet, according to all appearances, the loss to the interests of dramatic art is not very great. The Grecian tragedy had at first to struggle in Rome with all the inconveniences of a plant removed to a foreign soil: the Roman religion was in some degree related to the Greek, though by no means so completely the same as many have supposed; but the heroic mythology of the Greeks was merely introduced into Rome by the poets, and was in nowise connected with the national recollections. And 'although,' as Schlegel remarks, 'the Romans were at length desirous of becoming thorough Hellenists, they were deficient in that milder humanity of which we may observe traces in Grecian history, poetry, and art, even in the time of Homer. From the most austere virtue, which, like Curtius, sacrificed every personal inclination to love of country, they proceeded, with the most fearful rapidity, to a state of corruption, from avarice and luxury, equally unexampled. In their character they always betrayed that their first founder was not suckled at the breast of a woman, but of a raging wolf. They were the tragedians of the world's history, who exhibited many a deep tragedy of kings led in chains and pining in dungeons: they were the iron necessity of other nations—universal destroyers, for the sake of rearing at last, from the ruins, the mausoleum of their own dignity and freedom in the midst of an obsequious world reduced to one dull uniformity. It was not given to them to excite emotion by the mitigated accents of mental suffering, and to touch with a delicate hand every note of the scale of feeling. They naturally sought also in tragedy, by overleaping all intervening gradations, to reach at once the extreme, both in the stoicism of heroism, and in the monstrous fury of criminal desires. Nothing of their ancient greatness had remained to them but their contempt of pain and death, when, after an extravagant enjoyment of life, they were at length called upon to submit to those evils. They then impressed this seal of their former grandeur upon their tragic heroes, with a self-satisfied and ostentatious profusion.

Finally, in the age of polished literature, among a people fond, even to a degree of madness, of shows and spectacles, the dramatic poets were still in want of a poetical public. In the triumphal processions, the fights of gladiators and of wild beasts, all the splendours of the world, all the wonders of every clime, were brought before the eye of the spectator, who was glutted with scenes of the most violent and sanguinary description. What effect could the more refined gradations of tragic pathos produce on nerves so steeled? It was the ambition of the powerful among them to exhibit in one day to the people, on stages erected for the purpose, and immediately afterwards destroyed, the immense plunder which they derived from foreign or civil war. The relation which Pliny gives of the architectural decoration of the stage erected by Scaurus borders on the incredible. When magnificence could be carried no farther, they endeavoured

to surprise by the novelty of mechanical inventions. In this way, one Roman, at the burial solemnity of his father caused two theatres to be constructed in honour of him, with their backs resting on each other, and made to move in such a manner on a single hinge, that at the end of the play they were wheeled round with all the spectators within them, and formed together into one circus, in which gladiatorial combats were exhibited. In the gratification of the eyes that of the ears was altogether lost; rope-dancers and white elephants were preferred to every dramatic entertainment; the embroidered purple robes of the actor were applauded, as Horace informs us; and so little attentive and quiet were the great body of the spectators, that he likens their noise to that of the roaring of the ocean, or of a mountain forest in a storm.'

From the sole specimen of the tragic talent of the Romans that remains to us it would, however, be unfair to draw a conclusion as to the productions of better times: we allude to the ten tragedies which go under the name of Seneca. Respecting their real authorship the opinions of the learned are very much divided; some attribute them partly to Seneca the philosopher, and partly to his father the rhetorician; others ascribe them to one Seneca a tragedian, a different person from either. It is generally admitted that the several pieces are neither from the same hand, nor even of the same age. We might be induced to consider them as productions of a very late period; but Quintilian quotes a verse from the 'Medea' of Seneca, which is to be found in the play of that name in the collection in question, and hence the authority of this piece cannot be doubted, though in merit it does not seem in any way pre-eminent above the others. The state of violence and constraint in which Rome was kept under a series of sanguinary tyrants had also given an unnatural character to eloquence and poetry. Under the wise and mild government of a Vespasian, a Titus, and more especially a Trajan, the Romans returned to a purer taste. But whatever period may have given birth to these tragedies of Seneca they have been severely, perhaps, yet not unjustly, characterized as bombastical and frigid, unnatural in character and action, revolting from their violation of every propriety, and so devoid of theatrical effect as to induce a belief that they were never intended to leave the rhetorical schools for the stage.

With pagan Rome fell ancient art. Nevertheless there are one or two links of connection between the ancient drama and that of the middle ages, which modern writers have not always observed. There are even still existing some fragments of a play in Greek Iambics on a Jewish Scripture subject, taken from the Exodus or departure of the Israelites from Egypt. The principal characters are 'Moses, Sapphira, and God from the bush,' that is, God speaking from the burning bush. Moses delivers the prologue in a speech of 60 lines, and his rod is turned into a serpent on the stage. The author of this piece, a Jew named Ezekiel, is supposed by Warton, the historian of English poetry, to have written it after the destruction of Jerusalem, to inspire his dispersed and captive brethren with hopes of deliverance under a new Moses, and to have composed it in imitation of the Greek drama, at the close of the second century. (See the edition and German translation of L. M. Philipson, Berlin, 1830, 8vo.)

It appears that in the first ages of Christianity any one connected with the theatre was not allowed baptism. Among 'the fathers,' Cyril declares that when in our baptism we say 'I renounce thee, Satan, and all thy works and pomps,' those pomps of the devil are stage-plays and the like vanities. Tertullian, in like manner, affirms that they who in baptism renounce the devil and his pomps cannot go to a stage-play without turning apostates. Cyprian, Basil, and Clement of Alexandria are no less vehement on the same point; and Chrysostom exclaims loudly against such as could listen to a comedian with the same ears with which they heard an evangelical preacher. Augustine maintains that those who go to plays are as bad as they who write or act them. Tertullian, in his warmth against the buskined actors in particular, observes, with peculiar emphasis, that 'the devil sets them upon their high pantofles to give Christ the lie, who said nobody can add one cubit to his stature.' Rymer, in his 'Short View of Tragedy,' adds, that these flashes and drops of heat, from single authors, had no such wonderful effect, for that the tragedian still walked upon his high shoes. 'Yet,' says he, 'might they well expect a more terrible storm from the

reverend fathers when met in a body together, in council oecumenical. Then indeed began the ecclesiastical thunder to fly about; and presently the theatres, tragedy, comedy, bear-baiting, gladiators, and heretics, are given all to the devil without distinction.' But when the blind zeal of the fathers against all heathen literature had been ironically seconded by the emperor Julian with an edict forbidding any Christian to be taught in the heathen schools or to make use of that learning, two ecclesiastics of that time, of considerable learning, undertook to supply in some degree the deficiency of instruction and entertainment experienced by their Christian brethren from the operation of Julian's law. These were Apollinarius, bishop of Laodicea, and his father, a priest of the same city. [APOLLINARIUS.] The latter not only, in treating Scriptural subjects, imitated on a large scale the great epic and lyric poets of Greece, but also turned various historical passages of the Old and New Testament into comedies and tragedies after the Greek model. About the same time the celebrated Gregory Nazianzenus, patriarch and archbishop of Constantinople, composed plays from the Old and New Testament, which, converting the choruses into Christian hymns, he substituted for those of Sophocles and Euripides at Constantinople, where until then the old Grecian stage had continued to flourish. One only of Gregory's plays (or at least a play attributed to him) is extant, a tragedy, entitled 'Christ's Passion:' the prologue calls it an imitation of Euripides (it being, in fact, made up of scraps of that author), and at the same time acquaints us that in this piece the patriarch has the honour of introducing the Virgin Mary's first appearance on the stage. It is not known whether the religious dramas of the Apollinariii perished so early as some of their other writings, which were ordered to be destroyed for the very common offence of heresy; but certain it is that the species of literary culture which they endeavoured to supply gradually disappeared before the progress of Constantine's establishment.

In the general extinction of polite literature and liberal art, which darkened for so many centuries the moral face of Europe, every trace of truly dramatic performance or composition seems to have disappeared. The Saturnalian pageants—the Feast of Fools, the Feast of the Ass, &c.,—exhibited during that long interval, chiefly at the Christmas and New Year festivities, claim notice here, not as bearing much affinity to, but merely as in some degree filling up the place of, the old theatrical portion of the religious celebrations. To arrive once more at any indication of the general existence of what can with propriety be called a religious *drama*, we must descend to a later period of European history. And as in each of the great nations of modern Europe this religious drama gave way but gradually before that rise of the modern stage which accompanied the revival of letters, and has even, in one of those nations, strongly maintained its ground until very recent times, so as to become permanently incorporated, as it were, with the national theatre, we can most conveniently and effectively give such more particular notice of it in each nation as we have to present to our readers, in combination with the rapid view which we have to take of the rise and progress of the modern stage in each of the five great literary countries of Europe, viz., in Italy, Spain, France, Germany, and England. The theatre of each of these countries we shall consider, in the order of succession in which we have here enumerated them, but for the sake of convenience we have arranged the whole under ENGLISH DRAMA.

If there really survived, throughout the darkest period of the middle ages, in the form of successive imitations, any traces of the Christianized Greek drama of the primitive church, they seem to have been preserved, where perhaps we should most naturally look for them, among the Italians. Dr. Burney, in his researches into the history of music, ascertained that a spiritual play was performed at Padua as early as the year 1243; and in 1264 a company or fraternity was instituted at Rome, whose chief business was to represent, in the Passion week, the sufferings of Christ, and whose statutes were printed at that city in 1654. In 1298 the Passion was played at Friuli; and the same year, at Whitsuntide, the clergy of Civita Vecchia performed the play of Christ, that is, of his passion, resurrection, ascension, judgment, and the mission of the Holy Ghost: in 1304 they acted the creation of Adam and Eve, the annunciation, the birth of Christ, &c. The late Rev. Mr. Croft and the Hon. Topham

Beauclerk collected a great number of Italian mysteries; and at the sale of their libraries, Dr. Burney purchased many of the most antient, which he speaks of as being evidently much earlier than the invention of printing, from the gross manner in which the subjects are treated, the coarseness of the dialogue, and the ridiculous situations into which the most sacred things and persons are thrown.

DRAMMEN, a seaport town of Norway, situated on both sides of the broad and impetuous river of the same name, which here discharges its waters into the Drammen-fjord, in the gulph of Christiania. It lies in 59° 39' N. lat. and 10° 28' E. long. The town is divided into three quarters, of which Bragnaes is situated on the northern, and Stroemsoe and Tangen on the southern bank of the river: they are united by a flying-bridge. Bragnaes consists of a row of houses about a mile in length. Altogether, it is a lively town; the main streets are chiefly composed of storehouses. Tangen is, in fact, the roadstead and landing-place, and is consequently the resort of mariners, fishermen, and small dealers. Drammen has a parish church and two filial churches, two superior and several elementary schools, and manufactures of leather, tobacco, sail-cloth, oil, &c. The number of houses is about 1000, and of inhabitants about 6000. It is extensively engaged in trade and navigation, in building ships, and in the export of timber, deals, iron, &c. The water in the harbour is of depth sufficient to allow all vessels to lie alongside the quays and other landing-places. There are marble quarries in the vicinity.

DRASTICS. [CATHARTICS.]

DRAVE, or DRAU, a river of Austria, which issues from a bed of limestone on the Toblacher Heide, or heath, near Innichen, in the western part of the Tyrol. It thence descends in a south-easterly direction to Villach, in Carinthia, whence it flows easterly as far as Mahrburg in Styria: it then winds, chiefly south-eastwards, until it falls into the Danube, about 13 miles below Esseg, in Croatia, close to the castle of Erdödy, which lies on the right bank of that river. The whole length of the Drave, from its source to its junction with the Danube, is about 300 miles. It becomes navigable at Villach. Its tributaries are the Muhr, or Mur, which joins it at Legrad; the Guil, which rises in the Carinthian Alps, near Villach, and falls into the Drave below Cszaktonya; the Gurk, Glan, Lavant, &c. The valley of the Drave, which commences not far from Innichen, in the Tyrolese vale of the Puster, runs by Lienz, Sachsenburg, Villach, Mahrburg, and Pettau, until it approaches Varasdin, in Croatia, from which point the river flows through a level country. The valley is bounded by mountains nearly as far as Spital, from which point they sink to gentle elevations, and the valley grows wider: the hills again approach, within a short distance, on each side of the river, near Villach, and skirt the Drave as far as its confluence with the Glan. The valley of the Drave is confined to a breadth of a hundred paces near Kossig, and is narrowed to a few feet of towing ground near Seidlach, as well as between Saldenhofen and Mahrenberg. In its descent from Mahrburg, the Drave is accompanied, on its left bank only, by a range of heights, which continue as far as the neighbourhood of Pettau and Friedau, where the precipitous sides of the Mutzel mountains form its right bank. The current of the Drave is very rapid until it reaches Slavonia, where it flows sluggishly, forms swamps, and occasionally inundates the low country. Gold-dust is found in this river.

DRAWBACK, in commerce, is a term used to signify the sum paid back by government on the re-exportation of goods, upon the importation of which an equal sum has already been paid as duty. The object of this repayment is to enable the exporter to sell his goods in foreign markets unburthened with duties; and it is clear that if duties are required to be paid on the first importation, no transit trade can possibly be carried on unless drawback is allowed by the government. Payments of this nature, although they are sometimes confounded with bounties, are in principle essentially different from them. [BOUNTY.] Previous to the establishing of the warehousing system in this country in 1803, and when the payment of duties on all foreign and colonial merchandise, with the exception of tobacco and East India goods, was required on the first importation, drawbacks were in all cases allowed upon re-exportation. This course was injurious, not only to trade, but also to the revenue. It was injurious to trade, because of the larger

capital which was necessarily employed, and it was prejudicial to the revenue because it gave rise to numerous and ingenious fraudulent expedients, by means of which greater sums were received for drawback than had been originally paid by the importers; besides which, the machinery required for the collection and repayment of duties was more complicated and expensive than would otherwise have been necessary. The amount of customs duty collected in Great Britain before the passing of the warehousing act in 1803 was usually from twice to three times as great as the sum paid into the exchequer, the greater part of the receipts being absorbed by drawbacks, bounties, and charges of management.

The only articles upon which drawback was paid at our custom-houses, and the amount of repayment in 1836, were as follows:—

| | | | |
|-----------------------------|-----------------|----------|----------|
| Coffee | £72 | 14 | 0 |
| Rice in the Husk | 10,804 | 14 | 2 |
| Thrown Silk | 52,488 | 17 | 5 |
| Sugar | 556,153 | 15 | 5 |
| Tea | 21 | 11 | 2 |
| Timber | 81,987 | 1 | 5 |
| Tobacco and Snuff | 18,735 | 16 | 5 |
| Wine | 60,889 | 10 | 6 |
| Total | £781,154 | 0 | 6 |

The drawback on timber is not indeed a payment made on its re-exportation, but an allowance upon such quantities as are used in the mines. The quantities of thrown silk, sugar, and tobacco entitled to drawback had already paid duty previous to their undergoing a manufacturing process, and drawback on wine is only paid when exported in bottles, for transferring it to which from the cask it was, until lately, necessary to pay the duty: by a recent regulation wine intended for exportation may be bottled in the warehouse without paying duty. There is every reason to conclude that the payments made on the exportation of refined sugar are not purely drawback, but partake of the character of bounty, the price of the raw sugar being uniformly higher in our markets than in the countries to which the refined goods are sent.

DRAWBRIDGE, a bridge used in antient castles and in modern fortresses over a ditch or fosse, and capable of being raised up at one end so as to cut off the means of access. Drawbridges for this purpose are usually formed of boards nailed to a frame forming a platform, which is furnished at one end with hinges fastened to a beam placed parallel to one end of the frame. The bridge is raised by means of chains passed through the masonry of the gate. These chains are worked either by wheels or by hand, and thus the platform is raised to a perpendicular.

When drawbridges are made close on the outsides of gates, the masonry ought to be sunk so as to admit of the whole depth of the frame to lie within it, else the oblique fire from the besiegers' batteries would act on the edge of the frame and soon render it unserviceable. Nicholson's *Dict.* Fortified towns, such as Portsmouth and Calais, have drawbridges.

DRAWING, in its strict meaning, is the art of representing objects on a flat surface by lines describing their forms and contours alone, independently of colour or even shadow, although the latter is closely allied with drawing, both in practice and in theory; because, notwithstanding form may be clearly expressed by outline alone, shadow, while it gives surface and substance, is dependent upon form, and in many cases requires to be accurately defined according to the rules of perspective. More particularly is this the case when shadows are cast from any regularly shaped body upon one or more planes, as, for instance, the shadow from a column upon a flight of steps, or that of a man upon the ground and a wall; which natural profile, as that of a human figure against a wall, has been supposed to have first given rise to the idea of delineating the contours of solid bodies, by tracing their outlines. It is true, that except in geometrical forms with sharp edges, very few such lines exist in nature, outline being no more than the boundary of surfaces as it exhibits itself to the eye. Thus, in the case of a globe or a cylinder, there are no lines whatever in the one, no edges down the latter; their outline being not on any part, but merely the termination of that portion of it which is visible. The same holds good with respect to the human form, and to that of animals, whose limbs have no determined edges, but consist of parts more or less curved, and even when nearly flat—

take for instance the palm of the hand—never stopping so as to form a specific line or positive edge. The outline of the superficies will consequently vary according to the direction in which the object itself is viewed. Alluring as colour is to the eye, and principal as it seems to be in painting, it is really subordinate to drawing, because unless assisted by form, it is nearly valueless and unmeaning, incapable of expressing any thing; whereas form can distinctly represent objects without the aid of colouring, or even that of shadow, which latter is the adjunct and ally of the other two, being governed by both, inasmuch as form determines the position of shadows, colouring their proper tone and hue.

Although Drawing embraces all objects and their forms, in its more restricted technical sense, it is generally understood to imply the drawing of the human figure, as that species of it which is the most scientific in itself and the most important in art. Landscape painting requires comparatively little skill in drawing and no great exactness of hand, since the forms it deals with, such as those of trees, hills, rocks, birds, &c., being altogether irregular, general fidelity as to form is sufficient; while fidelity of colouring and aerial perspective, and the effect of light, are the qualities most essential to it. Colouring, indeed, may be said to be the very soul of landscape painting, for divested of that and reduced to mere outline, it loses its greatest charm, and nothing remains of it save the composition alone of the particular subject. Such, however, is not the case with historical painting, the chief merits of which are intimately connected with and capable of being displayed by outline alone. The painter of landscape, or of inanimate objects and mere imitative subjects, such as still life, &c., can trust to his eye alone, and even for perspective he has little occasion beyond an acquaintance with its general laws. Besides which his models are permanent and stationary, subject to little variation except in regard to certain casual and transitory effects of light and colour, that require to be hit off instantly; and therefore their forms may be studied and copied without difficulty. The same remark applies to those of the architectural draftsman, who has moreover the advantage of being able to apply the rules of perspective with unerring certainty upon every occasion. Far different is it with respect to drawing the human figure or animals, because, though their forms are regular and symmetrical, and require to be represented with the utmost correctness, they do not, like geometrical figures, admit of being delineated by the technical operations of perspective, since they consist of undulating surfaces and contours, whose perspective appearance and outline, according to the precise direction in which they are viewed, can be determined by the eye alone. Greater correctness of eye and expertness of hand are required to draw even a statue than a tree; the nicest observation of all the proportions, the most scrupulous attention to every lineament, to every minute detail, to every marking, every gradation of shadow however slight, are indispensable. Yet in such case the draftsman has nothing more to do than patiently copy a perfectly immovable object. But how incomparably more arduous than such task is that of representing similar forms taken from the living subject. Here, unless he be also well disciplined and grounded in anatomical knowledge, the best models will avail him little save as studies of proportion, and of such positions and attitudes as, although they are intended to express motion, can yet be preserved for a considerable time. He may, indeed thus perfect himself in that particular species of anatomical perspective which is termed foreshortening, and he may do much in the way of training both his hand and his eye, yet for direct action and motion his model will serve only to inform him what muscles they are that are brought more forcibly into play, and other transitory phenomena that disappear almost as soon as they exhibit themselves. Indeed some motions are so exceedingly rapid and fugitive that they can hardly be studied at all from the life, but if attempted to be shown in painting, must be represented according to theory, based upon the most exact anatomical knowledge. Some attitudes and motions are either so exceedingly evanescent, as those of the figures hurled down in Rubens's picture of the Fallen Angels, or so purely imaginary, as when angels or winged genii are represented hovering in the air, that such theory alone will enable the artist to express them with any degree of apparent fidelity. The extremities, that is, hands and feet, are among the most difficult parts of the figure, and require great practice in drawing. Drapery, again, is, next to the figure itself, of the

greatest importance, while it is less reducible to any positive rules for disposing it.

In order to attain to a complete mastery of the human figure, which after all is to be regarded only as the means to a higher aim, and the mechanical apparatus for effecting it, it is necessary to commence by studying what is tedious in itself, and seems almost foreign to the artist's purpose, namely, the internal configuration of the human frame. It is not enough to understand the proportions of the body and limbs, with the form and situation of the external muscles, but it is necessary that all the muscles, their purposes and functions should be well understood; nor must osteology, or the bones of the skeleton, be neglected. Indeed it is desirable that the artist should be able to draw the skeleton figure in any attitude, by which his figures will always be well put together. By way of practice in this respect, it has been judiciously recommended that as soon as he is a perfect master of the skeleton, the student should proceed to draw antique statues in that state, afterwards clothing them with muscles, as in the marble or cast before him. Without scientific knowledge of muscular action, the painter will be able to give his figures only attitudes, and those not always correct, should he have occasion to represent such as from their nature do not admit of being copied from the life. Unless, besides possessing a complete knowledge of the human body and the action of the limbs and muscles, he is also able to express the emotions of the mind, and that not as they display themselves in the countenance alone, but in gesture, attitude, and the whole frame, he will at the best produce only clever academical figures, skilfully drawn, but devoid of soul and sentiment. He must therefore endeavour to make himself master of expression, in the most comprehensive meaning of that very arduous and complex study, which, be it observed, depends entirely upon drawing and truth of delineation. For this purpose such works may be recommended as Bell's 'Anatomy of Expression.'

Perspective, which is generally treated of separately, and is therefore ordinarily considered a distinct study, is nevertheless a most essential part of drawing,—in fact its very grammar, all objects being subject to its laws, although, as already observed, they do not admit of being delineated according to the processes employed for drawing buildings, furniture, and such things as consist of strict geometrical forms. Yet even to those who may seldom have occasion so to apply it, it is eminently serviceable, were it only because it trains the eye, habituating it to notice the effects of position and distance, and affording ready and certain assistance, and an unerring test of correctness, in what might else be matter of perplexity and doubt. Abstruse too as it may seem in theory, and tedious in its application, its principles are few and simple, and subjects the most intricate and complex, and consequently operate in their delineation, demand no particular skill, but merely attention and patience alone. Reserving the science itself for the article PERSPECTIVE, we only advert to it here in order to press upon the student its importance, and that, instead of being an extraneous accomplishment, it is so inseparably connected with drawing, that it must of necessity be observed to a certain extent, although with no other guidance than what is derived from the eye, or else there will be no resemblance to nature; for perspective itself is based upon the laws of vision, and consists of practical rules deduced from them. It is true we frequently meet with glaring errors as regards both perspective and accuracy of form in the productions of many who are otherwise clever painters; yet so far from authorising similar negligence, in themselves they are imperfections which, although they may be redeemed by considerable merit in other respects, are nevertheless a drawback upon it.

The student would therefore do well to exercise himself thoroughly in drawing before he proceeds further; and the longer he confines himself to outline, with no other degree of shadow than what is necessary to express the character, the substance, or texture, and the different prominences or depressions in the superficies of objects, the more likely will he be to attain precision and correctness, as there will be nothing to conceal vagueness and inaccuracy of form, but form will be exhibited undisguisedly either in its beauty or the reverse. One great step towards correctness is to understand perfectly beforehand the object to be represented, its character both general and specific: when this is the case, the hand, supposing it

to be sufficiently well trained, readily obeys the eye and the mind. Constant observation, therefore, and as careful an examination of objects as if he was preparing to draw them, will greatly promote the student's advancement, and he will be really learning, when, because he is not actually at work with his pencil, he may seem to be doing nothing.

Drawing, as far as regards facility in delineating common forms and objects so as to enable a person to describe them promptly with the pencil, ought to be considered nearly as indispensable a part of education as writing itself. By this, such a degree of proficiency is meant as would enable a person either to express or explain his ideas upon paper, or to sketch from nature. Sketching, in the more popular meaning of the term, implies little more than the act of writing down in a kind of graphic shorthand the characteristic lineaments of a landscape or any individual object, an acquirement little more than mechanical, and which stands in about the same relationship to drawing, in its more elevated character, as an ordinary letter does to a finished literary composition. Like the sketcher, the draftsman only copies the objects before him, and those generally inanimate ones; but with this difference, that his drawings are expected to exhibit perfect fidelity, and admit of being worked up to a high degree of finish and beauty. Still he is no more than a transcriber: he may display his taste and judgment, as well as his accuracy; he may fully enter into the spirit of what he represents, and set it forth to view in a very captivating manner, but without exercising any degree of inventive faculty; whereas drawing, as far as it is synonymous with design, comprehends invention and composition, the plan and idea of the whole subject.

There are various manipulations or modes of drawing, distinguished according to the materials or implements made use of, such as chalk, black lead pencil, sepia or other tinted drawings; which last-mentioned class are sometimes called washed drawings, in which some indication of colouring is occasionally introduced. But what is termed water-colour drawing, as now practised, is altogether a species of painting, although the process is totally different from that of oil colours, or even distemper. Pen and ink drawings in the style of etchings, either with or without the addition of wash of shadow, are capable of producing considerable effect.

Painters' drawings or studies, such as those of the old masters, are highly valuable because they often exhibit their first conceptions in all their energy, and admit us to immediate intercourse, as it were, with their ideas as they arose in their minds.

The invention of Lithography has been applied with great success in Germany to making fac-similes of such drawings; it also enables artists to make drawings at once upon stone, from which impressions may afterwards be taken that are equivalent to autograph delineations, and of course excellent practical studies for beginners, as to handling and the management of the pencil.

DRAYTON, MICHAEL, was born at Harshull in the county of Warwick, in the year 1563. His life is involved in great obscurity, and different circumstances concerning him are rather conjectured than affirmed. It is supposed that he went to the University of Oxford, but without taking any degree, and also that he was in the army at an early period of life. Nine or ten years before the death of Queen Elizabeth he is said to have written poems. His earliest work was published in 1593, under the title of the 'Shepherd's Garland': it was afterwards revised and reprinted in 1619, under the name of 'Eclogues.' It is a collection of pastoral poems, among which is the ballad of 'Dowsabel,' extracted in Percy's Reliques. Shortly after the 'Shepherd's Garland' appeared his long historical poems, 'The Barons' Wars,' 'England's Heroical Epistles,' &c. His 'Polyolbion,' a descriptive poem on England, her natural productions and legends, made its appearance in 1613. This is the most celebrated of all his works: independently of its merits as a poem, the most respectable antiquaries refer to it for information, and consider it as authority. In 1626 we hear of Drayton as poet-laureate. He died in 1631.

The merits of Drayton as a poet are truly great. His historical poems have about them a heavy magnificence, the most gorgeous images and the boldest descriptions follow in stately array, clothed in well-turned and appropriate verse but unfortunately the obscurity of diction renders them exceedingly unattractive. The construction is most

painfully involved: a nominative case is often parted from its verb by an interval of six or seven lines; and hence, though these poems contain but few obsolete words, the reading of them is a serious study. The same observations will apply to the 'Polyolbion,' which is an immense mass of good sterling matter. All the birds and rivers of England are named one after another, but the descriptions are so close, that what we gain in instruction we lose in amusement. This poem is written in Alexandrines, and the measure is admirably managed. 'The Wars of the Barons' are written in ottava rima. Drayton has left one work which, in its way, has never been surpassed—a short fairy poem, called 'Nymphidia.' A more elfin work than this could not be penned: the author has contrived to throw himself into the feelings of the diminutive beings whom he represents. His descriptions of helmets made of beetles, earwigs being used as chargers, and other oddities of a like nature, display the very highest powers of fancy. A Lilliputian air breathes through the whole performance. Had Drayton written nothing but 'Nymphidia,' he would deserve immortality.

As few persons, except those who make the reading of English poetry a regular study, could be persuaded to go through the ponderous works of Drayton, we cannot recommend the general reader to a better book than Campbell's 'Selections from the British Poets,' where a specimen is given of every style in which this fine old author wrote.

Drayton has a tomb in Poet's Corner, Westminster Abbey.

DREAMS may be best described, in a few words, as trains of ideas presenting themselves to the mind during sleep. The person, to whose mind ideas present themselves in trains during sleep, is said to *dream*, and the word *dreaming* designates either the state of the mind in dreams, or else the susceptibility or potentiality of having dreams. We use the word in the former sense, when we speak of 'the state of dreaming;' in the latter, when we say that 'dreaming is a part of man's nature.'

It is the principal design of this article to present the reader with the *psychological* theory of dreams: to explain, first, the psychological law by which dreams, as being trains of ideas, are regulated, and to exemplify the operation of this law; and, secondly, by means of this law and of certain psychological circumstances peculiar to the state of sleep, to explain the differences existing between dreams, as being trains of ideas which occur in the state of sleep, and trains of ideas as they generally occur in the waking state. When dreams, as psychological phenomena, shall have been thus explained (in the scholastic phrase) *per genus et differentiam*, the reader will be in possession of the whole psychological theory of dreams.

But dreams may give rise, as they frequently have given rise, to an inquiry other than the psychological inquiry which we have indicated, viz., one which in common speech is called a *physical*, but which would be better called, by coining a word analogous to psychobiological, a *somatological* inquiry. Besides observing the mental phenomena of dreams, and referring these phenomena to a mental or (as we have before termed it) psychological law, together with certain psychological circumstances peculiar to the state of sleep, men may speculate on the manner in which the state of the body in sleep affects the mind—how the body when asleep is affected, and how again the body thus affected operates to the production of the phenomena of dreams. Of this physical or somatological inquiry, the greater and more important part, that which relates to the state of the body, belongs properly to the subject of sleep; while, as regards the manner in which the state of the body operates to the production of the phenomena of dreams, to determine which observation gives very small assistance, we shall state, in a second division of this article, the little that can be relied on.

In the third part of the article we shall give a few well-attested instances of dreams, accompanied by circumstances which, as they are related, do not seem to admit of explanation. And this will lead us naturally to say a few words concerning the supernatural character which, at different times and in different countries has been attributed to dreams.

I. We have said that dreams are trains of ideas presenting themselves to the mind during sleep. Occasionally, and under peculiar and definable circumstances, *sensations* are felt during sleep; some of which commonly do not awake the dreamer, while others, which awake him, are yet shown

to have been felt during sleep by the circumstance that a train of ideas called up by them passes before the mind, invested with the attributes of dreams, in an interval between the sensation and the waking. These sensations, however, are, from the nature of the case, comparatively so few, and, even when they are felt, so unimportant in comparison with the ideas which they call up, that they may very well be excluded from notice in a general description of dreams.

Bearing in mind then the existence of these few and unimportant exceptions, we shall henceforward speak of dreams as consisting only of ideas. And that the feelings composing dreams, which are at the time believed to be sensations, are not sensations, but only ideas,—that we do not see, hear, smell, taste, and touch what we believe at the time that we respectively see, hear, smell, taste, and touch, but that we only have the ideas of these respective sensations, cannot need proof. At any rate, the only proof which the nature of the case admits is one to be furnished by each individual for himself. Knowing the circumstances which, when he is awake, are concomitant with the having the feelings called *sensations*, and the circumstances which are concomitant with the state of sleep and of dreaming,—knowing further that these two sets of circumstances are incompatible with one another; while, on the other hand, the circumstances concomitant, when he is awake, with the having the feelings called *ideas*, are such that he may very well have them likewise when he is asleep; he cannot but conclude for himself (and if he do not, other means of proving it to him there are none) that the feelings of which he is conscious during sleep are not, as at the time he believes them to be, sensations, but ideas. He knows that when he is asleep and dreams, he is so situated that he cannot have the sensations which at the time he believes that he has. He knows that he *may*, in his then situation, have ideas; and, if he has any feelings at all, *must* have ideas. He must conclude then that what at the time he believes to be sensations are in reality only ideas, and must consider the appearance of these ideas as sensations, as a matter to be explained by means of psychological circumstances peculiar to the state of sleep.

Dreams, then, being thus assumed to be trains of ideas, we proceed to investigate the law by which they are regulated, and to exemplify the operation of the law.

On observing, or (to use the phrase which, when mental phenomena are spoken of, is more common) reflecting upon, our waking trains of ideas, we find that when two sensations, or two ideas, or a sensation and an idea have occurred in proximate succession, the sensation that occurred first, or its idea, or the idea that occurred first, is afterwards followed by the idea of the sensation that occurred second, or (as the case may be) by the idea that occurred second, and that this happens the more surely in proportion as such proximate succession of the two sensations, or two ideas, or sensation and idea has been more recent, and in proportion as it has been more frequent. Such is a brief statement of what is called the law of association, and of its laws. [ASSOCIATION.]

'When a man thinketh on any thing whatsoever,' says Hobbes, 'his next thought after is not altogether so casual as it seems to be. Not every thought to every thought succeeds indifferently. But as we have no imagination (idea), whereof we have not formerly had sense in whole or in parts; so we have no transition from one imagination to another, whereof we never had the like before in our senses.' (*Leviathan*, i. 3.) Hobbes has here enunciated the principle of previous proximate succession, or contiguity (whatever it may be called), and has spoken of it as the sole primary principle of association; the only defect in the manner in which he has enunciated it being the omission of the instances of two ideas, and of a sensation and idea occurring in proximate succession. Most subsequent writers on the subject have added other primary principles, more or less, to this one enunciated by Hobbes; and in so doing are, we think, chargeable with an imperfect analysis. Mr. Hume enumerated three principles, contiguity in time and place, causation, and resemblance; a fourth, contrast, which he named, he looked upon as a secondary principle resolvable into causation and resemblance. (*Essays*, vol. ii., p. 21.) Dr. Brown, finding great fault with Mr. Hume's enumeration, and observing that all suggestion (the phrase employed by him in the place of association) depends on prior co-existence (by which he means the same as we by proximate

succession), nevertheless does not seem to have perceived the processes by which resemblance and contrast may be resolved into this principle, and furthermore treats the topic under the threefold division of resemblance, contrast, and contiguity in place or time, all which he inconsistently calls primary principles. (*Lect. 34* foll.) Mr. Mill has two principles, subdivisions (and perhaps unnecessary subdivisions) of the one principle, as it is represented by Hume and Brown, contiguity; he calls them the 'synchronous order,' which, he says, answers to contiguity in place, and the 'successive order,' which, he says, answers to contiguity in time. (*Analysis of the Human Mind*, vol. i. p. 53.) He observes rightly, that the principles of causation, resemblance, and contrast, may be resolved into previous proximate succession; though he does not go through the analyses, and indeed the few hints which he gives of what he deems the necessary processes seem to show that he did not understand them.

The mode of resolving causation is obvious; causation indeed is but a name for previous proximate succession, under particular circumstances. Let us briefly explain (Mr. Mill not having done it) the modes of resolving resemblance and contrast into the same principle; taking, which is the most convenient method in such cases, a particular instance of each.

The sight of a man, A, calls up the idea of another man, B, who resembles him. Some of the sensations and ideas which are elements of the complex feeling called *the sight of A*, have been before present to the mind as elements of the complex feeling called *the sight of B*; and these sensations and ideas call up the ideas of the other sensations and the other ideas which go to make up the complex feeling called *the sight of B*, and which are not elements of the complex feeling called *the sight of A*; for with these other sensations and other ideas they have before existed in proximate succession, or (as we may say for shortness) have co-existed. These ideas, thus call up, co-exist (as we may again say for shortness) with the ideas of the sensations, and with the ideas, which, belonging both to the sight of A and the sight of B, called them up; and thus the idea of the sight of B, or the idea of B, is present to the mind.

Again, as regards contrast, the idea of a giant calls up the idea of a dwarf. One idea that is an element of the complex feeling called *the idea of a giant* is the idea of tallness, which idea is made up of the idea of height and that of greatness. The idea of tallness, and therefore that of height, is a vivid idea, or (changing the phrase) it is an idea on which the mind dwells, or which very frequently presents itself to the mind when a giant is being thought of; and so when a dwarf is being thought of, is the idea of shortness, which again includes the idea of height, a vivid idea. Now the idea of height being a vivid idea, or one which very frequently presents itself to the mind when a dwarf is thought of, is strongly (and strongly by reason of the frequent proximate succession of the two ideas) associated with the idea of a dwarf, as it is, for the same reason, strongly associated with the idea of a giant. The idea of the giant then calls up the idea of height, which has frequently before (as we may say for shortness) co-existed with the idea of the giant; and the idea of height thus called up, calls up, for the same reason, the idea of the dwarf.

We have dwelt thus at length on the psychological law of association, and its primary principle of previous proximate succession, because it may be said to be the key to the whole psychological theory of dreams. This law being fully comprehended at the outset, so much of the remainder of our task as consists in the exemplification of its mode of operation is made straightforward and easy.

We arrive at the law of association, as determining waking trains of ideas, by the processes of observation and of induction. We may either extend the law, thus arrived at in the case of waking trains of ideas, to the case of dreams, knowing independently that these are made up of ideas, and are therefore not different in kind from waking trains; or again we may arrive at the law, in the case of dreams separately, by the same processes of observation and induction. The former mode is as satisfactory as the latter; and in the way of this latter there are many difficulties, arising out of the nature of the case, which do not exist as regards the former. By the former mode, therefore, which is the easier, and which is at the same time logically correct, we come to the conclusion that, in dreams, one idea is followed by

another idea, when either the sensation of which the first is the copy has, at a previous time or times, been followed by the sensation of which the second is the copy, or when one of the ideas has followed or been followed by (as the case may be) the sensation of which the other is the copy, or again when the ideas themselves have been, at a previous time or times, present to the mind in proximate succession; and that this happens the more surely, or (changing the phrase) the association between the two ideas is the more strong, in proportion as the previous proximate succession has been more recent, and in proportion as it has been more frequent. Of the law thus modified by the circumstances of recency and frequency, *causation*, *resemblance*, and *contrast*, are names for classes of instances; and in dreams, as in waking trains, the idea of what is called a cause is generally followed by the idea of what is called its effect; the idea of an object which resembles another object is generally followed by the idea of the object which it resembles; and the idea of an object which is said to be contrasted with another object is sometimes followed by the object with which it is said to be contrasted. We will now exemplify, with somewhat more particularity, the operation of this law of association in dreams.

1. The classes of associations which make up the greater part of our mental history when we are awake, those concerned in naming, in classification and abstraction, in memory, in belief, in reasoning (whether to ourselves or by word of mouth or in writing), in imagination, in desires and aversions, in affections, occur likewise during sleep, and make up a considerable part of our mental history in sleep, that is, of our dreams. It will not be necessary to give instances of the occurrence of each of these classes of associations, as every one who is conscious of having dreamed must be conscious of having had these several states of mind during his dreams. And further, the giving of the instances would be of little use, unless the instances given of the several states of mind were analysed, and the associations forming these several states of mind set forth in the particular instances given; but this, even were it relevant to our present purpose, would carry us to an unreasonable length. Referring the reader then to Mr. Mill's masterly work, entitled the '*Analysis of the Human Mind*,' in which the working of the law of association is thoroughly developed, we shall content ourselves with some striking instances of reasoning and imagination, and with an exemplification of belief, of that kind which is most important for the full comprehension of dreams.

We not only converse, in dreams, with the persons whom we believe to be present, speaking to them, and again attributing to them connected words which we believe that they speak to us, but we frequently go so far as to make a speech or written dissertation, which, as remembered when we have awoke, is not only coherent, but often (owing to psychological circumstances peculiar to the state of sleep) more clearly and forcibly arranged than it would have been had we been awake, and had we actually spoken the speech or written the dissertation. Condillac is said to have often brought to a conclusion in his dreams reasonings on which he had been employed during the day, and which he had not completely worked out when he retired to bed. (Cabanis, *Rapports du Physique et du Moral de l'Homme*, ii. p. 395.) Cabanis says, in the same place, of Franklin:—'I knew a very wise and enlightened man who believed he had often been instructed in his dreams concerning the issue of events which at the time occupied his mind. His strong head, and his freedom, in every other respect, from prejudice, had not been able to guard him against a superstition in respect of these inward warnings. He observed not that his profound skill and rare sagacity continued to direct the action of his brain during sleep.'—The circumstances under which Mr. Coleridge composed the fragment called '*Kubla Khan*' have been described by himself as the following, and we see no reason to discredit his statement.* He had taken an anodyne which had been prescribed to him in consequence of a slight indisposition, and fell asleep in his chair while he was reading in Purchas's *Pilgrimage* of a palace built by Khan Kubla; he remained asleep for about three hours, during which, as he himself tells us, 'he could not have composed less than from

* This account was ridiculed in the '*Edinburgh Review*' (vol. xvii. p. 65), in one of a series of articles on Mr. Coleridge, concerning the truth and taste of which the world has now very unequivocally expressed its opinion. As no arguments are adduced in support of the reviewer's denial of Mr. Coleridge's statement we consider ourselves justified in retaining our own faith therein.

two to three hundred lines; if that indeed can be called composition in which all the images rose up before him as things, with a parallel production of the correspondent expressions, without any sensation or consciousness of effort.' On awaking he instantly sat down to commit his poem to paper. After having written so many lines as were afterwards published, he was interrupted by a person on business; and when he returned to the task the poem had vanished from his memory. The fragment begins thus:—

'In Xanadu did Kubla Khan
A stately pleasure-dome decree:
Where Alph, the sacred river, ran
Through caverns measureless to man
Down to a sunless sea.'

The poem proceeds as one stream of melody; and the diction is throughout beautifully appropriate and condensed. (*Poetical Works*, i. p. 266.)—There are many trite instances, which we shall only thus generally allude to, of writing performed during sleep, under the particular circumstances which constitute somnambulism. These particular circumstances, it will be observed, affect the body only, and in no wise affect the mind or its operations.

Our belief in the presence of external objects not present is one of the most curious and, from the frequency of its occurrence, together with its curiousness, one of the most important of the phenomena of dreams. This belief is a complicated case of association. When we are awake, and, having sensations of sight from a present object, believe that the object is present, we have, first, the sensations of sight which the object excites, then the ideas of distance and extension and figure, which are closely associated with these sensations: again, the ideas of all the other sensations which the object has at other times and in other circumstances excited (those of resistance, smell, sound, &c.), and of ourselves as having these sensations: and, lastly, the idea of a cause of all those sensations, whether present or past, whether those which are themselves, or those of which only the ideas or copies are present to the mind. All those ideas, inseparably associated with the sensations of sight of which we are conscious, make up the complex state of mind called *belief in the presence of external objects*, or *belief in the existence of external objects present*. The same ideas, inseparably associated with the ideas of the sensations of sight which were themselves present in the former case, constitute another complex state, which is also a state of belief in the existence of the external objects, but which, having ideas of the sensations of sight instead of the sensations themselves, is thus distinguished from the former state, and which may be called *belief in the existence of external objects not present*. This last state of mind is the one which occurs during sleep, appearing to be the former one. Why it so appears we shall explain presently. At present we have had to do only with what it actually is, and with the associations which it comprehends.

2. It is said that a man's character and pursuits influence his dreams. Now we mean by the phrase 'a man's character,' nothing more than certain classes of associations which occur to him most frequently; and his 'pursuits' again, viewed subjectively or in respect of himself pursuing, may be paraphrased in the same way. When we say then that a man's character and pursuits influence his dreams, it is only a way of saying that those associations which most frequently occur when he is awake will also occur most frequently, *ceteris paribus*, when he is asleep. This circumstance, therefore, observed in dreams, exemplifies the manner in which frequency strengthens association. It would be but a waste of words to bring particular instances in support of the general remark; and indeed it will be incidentally exemplified in some of the illustrations which we shall presently adduce of the influence of sensations on dreams.

3. Dreams turn upon subjects which have been present to the mind recently, rather than those which have been present to it at a greater distance of time. In other words, the most recent associations will recur, *ceteris paribus*, the most frequently in our dreams. As under the last head, therefore, was exemplified the influence of frequency on association, so under the present is that of recency exemplified; and it will not be necessary to dwell any longer upon this than upon the last topic.

4. We shall enter at rather greater length into the manner in which the sensations occasionally felt in sleep modify dreams through association. We have already alluded to the occasional occurrence of these sensations. They are themselves very unimportant parts of dreams, even when

they occur; but they call up vivid and interesting trains of ideas, the connexion between which and the sensations it is amusing to trace. We shall take the different kinds of sensations separately.

a. Of the five external senses, sight is the least excitable during sleep. But a strong light brought before the eyes of a person sleeping generally affects the nerves concerned in the sensation of sight; a sensation of a light is generally felt; and whilst its ultimate effect is almost always to awaken the sleeper, a train of ideas associated with the sensation of a light is first called up, and passes before the mind in the interval between the sensation and waking. The sleeper probably awakes from a dream of some conflagration, whether one which has actually taken place (for instance, the conflagration of Moscow, or any other which may have been impressed on his mind), or else a conflagration of some house well known to him, perhaps even his own.

b. The least excitable of the senses, after sight, is taste. And even so far as it is excitable, the circumstances under which we sleep are such as to preclude almost entirely the possibility of its being brought into action. When, however, from ill-health, or in consequence of something which we have ate shortly before going to bed, there is (in the vulgar phrase) a bad taste in the mouth, this may have its effect on dreams. 'A bad taste in the mouth,' says Mr. Macniah, the author of a book called the 'Philosophy of Sleep,' which, however, is not exactly the book of a philosopher, 'presents us with everything bitter and nauseous in the vegetable world; a mercurial course perhaps with the mines of Spain, from whence that mineral is obtained.' (p. 69.)

c. Smell comes next of the senses, in respect of defect of excitability during sleep. The circumstances under which we sleep are again such as to preclude almost entirely the action of this sense; and it is difficult, while it is by no means important, to select an apposite instance of its operation in modifying dreams.

d. We come next to the sense of hearing. 'The sound of a flute in the neighbourhood,' says Mr. Macniah, 'may invoke a thousand beautiful and delightful associations. The air is perhaps filled with the tones of harps, and all other varieties of music; nay the performers themselves are visible; and while the cause of this strange scene is one trivial instrument, he may be regaled with a rich and melodious concert.' (p. 61.)—A loud noise taking place near the sleeper, heard by him, and eventually awaking him, calls up ideas of various loud noises, and these again various other ideas associated with them. The following curious instance, which exemplifies the tendency of ideas that have been most frequently and most recently present to the mind to recur in dreams, is taken from Dr. Abercrombie's work on the Intellectual Powers. At a time when the inhabitants of Edinburgh were all in constant alarm of a French invasion, and every preparation had been made for the landing of the enemy, it was further arranged that the first notice thereof should be given by a gun from the castle. 'A gentleman,' says Dr. Abercrombie, 'who had been a most zealous volunteer, was in bed between two and three o'clock in the morning, when he dreamt of hearing the signal gun. He was immediately at the castle, witnessed the proceedings for displaying the signals, and saw and heard a great bustle over the town, from troops and artillery assembling. At this time he was roused by his wife, who awoke in a fright, in consequence of a similar dream, connected with much noise and the landing of an enemy, and concluding with the death of a particular friend of her husband, who had served with him as a volunteer during the late war. The origin of this remarkable concurrence was ascertained, in the morning, to be the noise produced in the room above by the fall of a pair of tongs, which had been left in some very awkward position, in support of a clothes-screen.' (p. 277.)—Again, whispering in a person's ear when he is asleep is found sometimes to modify his dreams very considerably. Some persons, it is true, are instantly awaked thereby; others, who sleep on, are not conscious when they awake of having had dreams akin to the subjects on which the whisperer has discoursed; while others again may have their dreams modified at one time by the whispering, and not at another, according as the sleep is more or less deep. But instances are recorded of persons susceptible always, and, to a peculiar degree, of the influence of this whispering in the ear on their dreams. Dr. Abercrombie gives an amusing account of an officer in the expedition to Louisburg in 1758, on whom his companions

in arms, knowing his susceptibility, used constantly to amuse themselves by practising the whispering. 'They could produce in him any kind of dream by whispering into his ear, especially if this was done by a friend with whose voice he was familiar. At one time they conducted him through the whole progress of a quarrel, which ended in a duel; and when the parties were supposed to be met, a pistol was put into his hand, which he fired, and was awakened by the report. On another occasion, they found him asleep on the top of a locker or bunker in the cabin, when they made him believe he had fallen overboard, and exhorted him to save himself by swimming. He immediately imitated all the motions of swimming. They then told him that a shark was pursuing him, and entreated him to dive for his life. He instantly did so, with such force as to throw himself entirely from the locker upon the cabin floor, by which he was much bruised, and awakened of course. After the landing of the army at Louisburg, his friends found him one day asleep in his tent, and evidently much annoyed by the cannonading. They then made him believe that he was engaged, when he expressed great fear, and showed an evident disposition to run away. Against this they remonstrated, but at the same time increased his fears by imitating the groans of the wounded and the dying; and when he asked, as he often did, who was down, they named his particular friends. At last they told him that the man next himself in the line had fallen, when he instantly sprung from his bed, rushed out of the tent, and was roused from his danger and his dream together by falling over the tent-ropes.' (p. 278.)

e. Of the five external senses, touch is the most excitable during sleep. In continually changing, as we do, our position during sleep, we are influenced by tactile sensations of which the bed and the bed-clothes are the causes. We are most easily awakened by being touched, the slightest tickling in the nose or the sole of the foot being sufficient for the purpose. And as regards the operation of sensations of touch in modifying dreams, let it suffice to observe generally, that those by which we are awakened may call up, in the interval between the touch and the waking, ideas of various causes of touch which will be pleasurable or painful ideas according to other circumstances.

f. Sensations of bodily pain, or of disorganization (as they have been named by Mr. Mill, who has been the first to treat of the munder a separate head), including the sensations of heat and cold, frequently occur to modify dreams. Hobbes has enunciated this modifying circumstance with distinctness, interweaving however a somatological hypothesis for its explanation which is neither necessary nor correct; but this hypothesis may be kept apart from the enunciation of the fact. 'And seeing dreams are caused by the distemper of some of the inward parts of the body, divers distempers must needs cause different dreams; and hence it is that lying cold breedeth dreams of fear, and raiseth the thought and image of some fearful object (*the motion from the brain to the inner parts, and from the inner parts to the brain being reciprocal*); and that as anger causeth heat in some parts of the body when we are awake; so when we sleep, the over-heating of the same parts causeth anger, and raiseth up in the brain the imagination of an enemy.' (*Leviathan*, i. 2.)—Dr. Abercrombie furnishes us with the following instance of a dream caused by cold. Dr. Gregory, who had recently been reading an account of Hudson's Bay, dreamt one night that he spent a winter in that part of the world, and suffered intensely from frost; and upon awaking he found that he had thrown off his bed-clothes during sleep (p. 276). Heat arising from an accumulation of bed-clothes will lead to a dream of an opposite character, the particular ideas associated with the sensation of heat which come in to make up the scenes being dependent, as in the case of Dr. Gregory's dream, on particular circumstances.—The same Dr. Gregory having applied a bottle of hot water to his feet one night in consequence of indisposition, dreamt that he was walking up Mount Ætna, and felt the ground under him warm. Dr. Reid, having one night a blister applied to his head, dreamt that he was scalped by a party of Indians. (Abercrombie, *id.*; Stewart's *Philosophy of the Human Mind*, vol. i. p. 335.) The writer of this article, when suffering once from acute pains in the back during a rheumatic fever, dreamt that he was pursued by enemies, who were shooting arrows at him, and whose every arrow told.

g. Sensations in the alimentary canal, sometimes pleasur-

able and sometimes painful, have a very important influence on dreams. These sensations indeed influence very considerably our waking trains of ideas; and much more, inasmuch as in sleep there are no external objects to call us away from the ideas which these sensations call up, do they influence our sleeping trains. When the digestion is good, and we have ate nothing which weighs upon or disagrees with the stomach, our dreams are, generally speaking, pleasurable. When, on the other hand, we suffer from indigestion, which, in respect of the effect, is but a name for an aggregate of painful sensations in the alimentary canal, we are afflicted with dreams of the most painful character. The exhilarating effects of opium and of intoxicating draughts, which effects are neither more nor less than sensations in the alimentary canal, are also discernible in dreams. And in connexion with this topic, we may allude to the dreams caused by the uneasy sensations attendant on obstructed respiration, which, sometimes caused by and sometimes combined with indigestion, constitute the most dreadful evils to which in sleep we are subject, and which are known to all under the name of nightmare.

We have thus explained the law of association which determines the formation of dreams, and have exemplified its operation. Thus far, it will be observed, we have spoken of dreams only in their generic character of trains of ideas; or, at least, any reference which we have made to the specific circumstances which distinguish them from trains of ideas in the waking state has been incidental. It remains, in order to complete the psychological theory of dreams, to state and explain the circumstances distinguishing dreams, as trains of ideas during sleep, from trains of ideas as they generally occur in the waking state. We say as they generally occur, because in the waking state there are trains of ideas, which occur under peculiar circumstances, resembling dreams, and differing from the generality of trains of ideas in the waking state in those very points by means of which dreams, and the generality of waking trains, are to be distinguished from one another. The trains of ideas which in the waking state occur thus under peculiar circumstances are those called *reveries*, or, more expressively, *waking dreams*; and again, those which present themselves to the mind during delirium.

1. Ideas which occur in dreams are believed to be sensations; scenes fashioned by the fancy are believed to be real. What has been already said, when we were resolving this belief in the presence of external objects not present into its component elements, in order to exemplify the operation of the law of association in dreams, has expedited the explanation of this phenomenon. When we are awake we are conscious continually of two different states of mind, belief in the existence of external objects present, and belief in the existence of external objects not present. These two states of mind differ only in this point, that the former comprehends certain sensations of sight, while the latter, in the place of the sensations themselves, has but the ideas of the sensations. Now, when we are awake, ideas are compared with sensations, the belief in the existence of external objects not present with the belief in the existence of external objects present; and ideas are seen to be less vivid than sensations, the former belief than the latter belief. Thus, and thus alone, are these states of mind respectively distinguished from each other when we are awake; but when we are asleep we have no sensations with which to compare our ideas, and no external objects present, with the belief in whose presence we can compare the belief in their existence when they are not present. Ideas therefore, no longer viewed relatively, take the place of sensations; they are the most vivid representations which present themselves to the mind of the qualities of external objects; and, being the most vivid, are believed to be sensations. Whence it follows that the belief in the existence of external objects not present takes the place also of the belief in the existence of external objects present, or (changing the phrase) the belief in the presence of external objects. It may also be, that ideas when we are asleep are, from bodily causes which we cannot trace, actually more vivid than are the same ideas when we are awake: if this be so, which we cannot positively say, but which is probable, it will combine with the previous consideration to explain the above-mentioned phenomenon.

Dr. Hartley wrote upon this point with great sagacity; and the only fault in the following extract is the intrusion of a material hypothesis at the end of it. 'The scenes which

present themselves are taken to be real. Now this happens, first, because we have no other reality to oppose to the ideas which offer themselves, whereas in the common fictions of the fancy, while we are awake, there is always a set of real external objects striking some of our senses, and precluding a like mistake there, or if we become quite inattentive to external objects, the reverie does so far put on the nature of a dream as to appear a reality; secondly, the trains of visible ideas which occur in dreams are far more vivid than common visible ideas, and therefore may the more easily be taken for actual impressions. For what reasons these ideas should be so much more vivid, I cannot presume to say. I guess that the exclusion of real impressions has some share, and *the increased heat of the brain may have some likewise*. The fact is most observable in the first approaches of sleep, all the visible ideas beginning then to be more than usually glaring.' (*Observations on Man*, vol. i. p. 398, ed. 1810.)

Thus it is that we never dream of a past event as a past event. Any historical event of which we dream is believed to be taking place before our eyes, and any historical individual to be our companion. Another singular consequence is observable in the case of dreams produced by sensations of bodily pain. The sensation of the pain may call up, as well as kindred ideas of pain and its causes, an idea of that which will remove the pain, which, when we are awake, must often follow the sensation of pain; and this idea will be taken for the actual presence of that which is fitted to relieve us. When, for instance, we hunger or thirst in sleep, these uneasy sensations call up respectively the ideas of food or drink; we believe that we have food or drink in our possession, but (the hunger or thirst of course continuing) we go on to dream of some occurrence which prevents the satisfaction of our appetites; or perhaps we have the idea of the taste of the food or drink, and believe that we have the sensation of tasting, but yet the hunger or thirst is not allayed. Immediately some other viand or beverage presents itself to us; again are we debarred from the enjoyment, or again do we taste and profit not; and thus does the dream proceed until we awake.

The incongruity of dreams, or (in other words) the grouping of objects in our dreams which could not exist together in reality, results immediately from this mistaking of ideas for sensations. There is no more incongruity in the collocation of our ideas themselves during sleep, than in that of our ideas in the waking state. In both states they follow one another according to the same law. But when we have ideas of objects during sleep, we believe that the objects are themselves present; and though the collocation of the ideas is natural, and such as would excite no surprise in the waking state, the collocation of the objects is strange, and would then also excite surprise. Dreams, though only trains of ideas, are believed at the time (as has been explained) to be successions of objects; and when afterwards remembered as such, they seem strange and incongruous. Dryden's poetical description and instance may here relieve the weariness of our own prose:—

* Dreams are the interludes which fancy makes:
When monarch reason sleeps, this mimic wakes,
Compounds a medley of disjointed things,
A court of coblers or a mob of kings.'

2. There being no sensations in sleep, as in the waking state, to break off the trains of our ideas, the associations which have been at any previous time or times formed between these ideas have more uninterrupted play when we are asleep than when we are awake. When we are awake, one idea calls up another, this perhaps a third, and thus a train of ideas is commenced, when of a sudden we see some object; the sensation then takes possession of the mind, and (in the common phrase) the attention is withdrawn from the train of ideas. When we are asleep this cannot happen; and an association between any two ideas has to give way only to a stronger association between one of them and a third.

The greater coherency, than if they were made by us when awake, of speeches or essays which we believe in our dreams that we speak or write, has been already noticed.

Thus it is that we often go through a repetition in our dreams with considerably greater ease than we can do it when awake. For the same reason again, ideas occur to us in our dreams of which we have not for a very long time been conscious when awake, and which we have been perhaps unable, when anxious to do so, to call up; and trains of ideas are gone through, which we have

perhaps wished to complete, when awake but to no purpose, inasmuch as the associations between the several pairs of ideas in the trains are too faint to bear up against the continual interruptions of sensations. These ideas and trains of ideas occurring in dreams, which we are unable to call up when we are awake, are said to have been forgotten. Dr. Abercrombie gives an instance of a gentleman who, having been something of a Greek scholar in his youth, had afterwards so entirely forgotten the language that he could not even read the words, but who often dreamt of reading Greek works which he had used at college, and in such manner as to understand them. (p. 284.) Sir Walter Scott relates a very extraordinary dream of this kind in his *Notes to 'The Antiquary'*, in the last edition of the *Waverley Novels*, to which we must content ourselves with referring the reader.

We may observe, that the same revival of long-forgotten ideas and trains of ideas takes place often during delirium, the similarity between our trains in which state and our dreams we have already alluded to. A very singular instance of such revival during delirium is related by Mr. Coleridge, in his '*Biographia Literaria*' (vol. i. chap. vi.)

To this head is to be referred a remark generally made concerning dreams, that the mind exercises no control over the ideas which compose them, or (as it is otherwise expressed) that the mind does not exert its will upon them, as it does upon ideas composing trains in the waking state. The mind is not diverted from the trains of ideas which pass before it by the occurrence of sensations; thus it need not desire, as it continually does in the waking state, to have the ideas composing the trains rather than the sensations; and thus the ideas are not presented to it, as they continually are in the waking state, in that particular combination which is called *desire of the ideas*, or *willing of the ideas*. This, we believe, is the full extent to which the remark concerning the absence of will (as it is called) over ideas in dreams is true; though, from the manner in which it is expressed, it seems, and indeed it is generally intended, to imply much more.

When we are awake, we are said to will bodily actions, and to will mental actions or ideas. Now, when we are asleep, we will bodily actions likewise; but from the manner in which the body is affected during sleep, the actions do not follow the state of mind called *will*, as they do when we are awake. We will to run from an enemy who, we believe, is pursuing us, but we cannot run; the muscles are so affected in sleep that their action does not follow the state of mind called *will*, as it does when we are awake. Every one who has dreamed must have experienced such a dream as this, and must remember the fear which follows it. But the circumstance that the action does not follow by no means affects the existence of the state of mind called *will* during dreams; and in sleep therefore, as in the waking state, we will bodily actions. Again, as regards mental actions or ideas, we exert our will over these, in the waking state, either by attending to them, or by endeavouring to recollect them, and in no other way; and every one who has dreamed must be conscious of attention to trains of ideas during his dreams, and of endeavours to recollect ideas. Thus neither as regards mental actions is there any absence during dreams of the state of mind called *will*.

The only difference in respect of this state of mind between dreams and waking trains is, as we have said, that in the former there is not so much need of attention to the ideas as in the latter; inasmuch as dreams are not interrupted by sensations, as are trains of ideas in the waking state.

3. Our measure of time during dreams appears not to coincide with that in the waking state. Having fallen asleep for a few moments, we believe that we go through, before we awake, a series of events which would occupy, did they really happen, days or months, or even years. And the same takes place often, when a sensation occurs to awake us, in the brief interval between the having of the sensation and the waking. Dr. Abercrombie gives the following instance, which will serve us as well as any other for illustration:—'A gentleman dreamed that he had enlisted as a soldier, joined his regiment, deserted, was apprehended, carried back, tried, condemned to be shot, and at last led out for execution. After all the usual preparations, a gun was fired: he awoke with the report, and found that a noise in an adjoining room had both produced the dream and awaked him.' (p. 279.) Again: 'A friend of mine,' says Dr. Abercrombie, 'dreamed that he crossed the Atlantic,

and spent a fortnight in America. In embarking on his return, he fell into the sea; and having awaked with the fright, discovered that he had not been asleep above ten minutes.

This discrepancy between our notions of time when we are asleep and when we are awake may be very easily explained. The idea of time is only an idea of so many successions of events, or of ideas, whether called up by these events or otherwise. On looking back through any period of our mental history, if we remember many feelings that have succeeded the one to the other, we have the idea of a long time; if few, of a short one. Now ideas are remembered in proportion as they are interesting or vivid. In the waking state and in sleep the same ideas would pass before the mind during the same time; but in the waking state they would be viewed as ideas only, and the greater number would not be remembered. But in sleep they are believed to be sensations, the events thought of are believed actually to take place, and the ideas thus become interesting to such a degree that they cannot be forgotten. Looking back through these ideas, and remembering every one of them, we judge the time during which they have passed before the mind to have been a long time.

4. It remains to speak of the absence of surprise in dreams. It is not indeed true that the feeling of surprise is altogether absent from dreams, as is generally asserted; while in those cases in which it is absent, and in which its absence is thought worthy of remark, the explanation is simple. In our dreams we believe that we see persons who are either dead or in a distant country, and we are not surprised; we believe that we witness events which happened a very long time ago, and we are not surprised. Now we have the ideas of the persons and events, and we have not at the same time the ideas of the death or the distant country or the distant time at which the event took place; having the ideas of the persons and events, we believe these ideas, as has been already explained, to be sensations; and as we have not, together with the apparent sensations, the ideas of the death, distant country, &c., we have no ideas with which the apparent sensations are incongruous; and there being no incongruity, there is nothing to surprise us. We think of the persons or events, as we might think of them when awake, without certain additional ideas; and not having these additional ideas, we are not surprised at seeing, or believing that we see, the persons or events, any more than we should be surprised at seeing (could we by possibility do so) the same persons or events when we were awake, if we knew not that the person had died or was in another country, or that the event was one of history.

This explanation is confirmed by those instances in which we do feel surprise. The idea of a person or event believed to be seen may call up any of the additional ideas that have before been absent. We believe that we see a person, and we then think of his death; we are immediately surprised; and we dream that we are dreaming. Every one who has dreamed must have experienced such a dream as this.

II. This second part of the article was to contain so much of the little that is known concerning the state of the body in sleep as is relevant to the subject of dreams.

The organs of the five external senses are so affected by sleep, that the sensations which respectively pertain to them are either not felt at all, or are felt very much less often, and very much less, than when we are awake, and even when they are felt they generally awake us. But of this we have already spoken.

We have also spoken of the effects of sensations of bodily pain and of internal sensations on dreams. The manner in which sickness, through the medium of internal sensations, intensifies dreams, is familiar to every one.

It is a question whether sleep operates on the mind as well as on the body; whether, while it suspends the action of the body, it also, either through the body or otherwise, suspends the action of the mind. This is a question on which we cannot speak positively, and on which our opinion can be determined only by the greater probability of the one side or of the other.

Some writers assert that we do not always dream when we are asleep. They say that the proper effect of sleep is to suspend the action of the mind as well as of the body, and that, to the extent to which we dream, sleep is impaired. They speak of two kinds of sleep, the one in which we do not dream, and which they call *perfect sleep*; the other, in which we dream, and which they

call *imperfect*. One of these writers is Mr. Locke, who has expressed a very decided opinion that during sleep we do not always think; his arguments in favour of the opinion being, that all of us are conscious of having no dreams during a considerable portion of the time that we sleep, that some persons even do not dream at all, and that a supposition that the dreams are forgotten almost the very moment after they have taken place is absurd. (*Essay on the Human Understanding*, 2, i. sec. ii.) If however we do not dream always, how is the beginning of our dreams accounted for? The mind is, on this supposition, at a particular period of sleep, void of ideas; an idea suddenly enters it, and dreaming begins. Now the idea was not called up by an idea antecedent to it, for antecedently there was no idea in the mind. How then did it come to enter the mind? This consideration appears to us adequate to set the question at rest as to whether we dream always or not.

Dreaming always, we may remember or forget our dreams according to whether our sleep is deep or slight, and remember them in proportion as it is not deep. One part of the same fit of sleep is more intense than another; the dreamer remembers the dreams of this last part, but forgets those of the first, as regards which it is the same as if he had not dreamt at all. In one state of health the same person has a greater amount of deep sleep than in another; he in consequence remembers his dreams better, or (as he would most probably express it) he dreams more in the second state of health than in the first. Again, one person's bodily constitution is such as to make his sleep generally more intense than that of another person, and in consequence he is less of a dreamer. There have been instances of persons who do not remember ever to have dreamed, and of others who have not remembered any dreams until at a very advanced period of life.

III. As regards the instances of dreams which we propose to relate, there are three possible cases; they are either untrue, or true and explainable by ordinary or natural means, or else true and not so explainable, and therefore (in the common phrase) supernatural. Now these instances are so far authenticated, that we are not authorized altogether to discredit them. Not discrediting them, we are yet unable to explain them by the ordinary means; though it is possible, certainly, that as the dreams and their attendant circumstances come to us, there may be both some exaggeration in the dreams themselves, and some omission of incidents previous to the occurrence of the dreams which might help to explain the attendant circumstances. On the other hand, the instances (and we are about to give merely a selection) are numerous. And again, there is another set of incidents, also well authenticated, which, like these instances of dreams, are, if we believe them as they are related, unsusceptible of explanation by ordinary or natural means. We refer to the many stories told of the appearance of persons, at the moment of death, to friends or relations at a distance from the spot where the death takes place. Now these incidents pave the way to some extent for a belief in the supernatural character of such dreams as we are about to relate. If these incidents are believed to be supernatural, there is no reason why there should not also be supernatural dreams. We must observe however that in calling either the incidents to which we have referred or the dreams supernatural, we mean no more than that they cannot be explained by natural means. We cannot say how they were brought about; neither can we say, looking at the particular circumstances under which they happened and the particular persons to whom they happened, why they were brought about.

The first instance that we give is of a dream which occurred to a gentleman now alive, and which was related by him to members of his family who are also now alive, and to other persons, on the day after he dreamt it, and before the event which he seems to have foreseen in his dream was known. We extract the account of the dream, making some immaterial alterations, from a book called the 'Royal Book of Dreams,' in which it is given with the greatest particularity. 'In the night of the 11th of May, 1812, Mr. Williams, of Scorrion House, near Redruth, in Cornwall, awoke his wife, and, exceedingly agitated, told her that he had dreamt that he was in the lobby of the House of Commons, and saw a man shoot with a pistol a gentleman who had just entered the lobby, who was said to be the chancellor; to which Mrs. W. replied that it was only a dream, and recommended him to go to sleep as soon

as he could. He did so; but shortly after he again awoke her, and said that he had, a second time, had the same dream. The same vision was repeated a third time; on which, notwithstanding his wife's entreaties that he would lie quiet and endeavour to forget it, he arose (then between one and two o'clock) and dressed himself. At breakfast the dreams were the sole subject of conversation; and in the forenoon Mr. W. went to Falmouth, where he related the particulars of them to all of his acquaintance that he met. On the following day, Mr. Tucker, of Trematon Castle, accompanied by his wife, a daughter of Mr. W., went to Scornor House on a visit. Mr. W. related to Mr. T. the circumstance of his dreams; on which Mr. T. observed that it would do very well for a dream to have the chancellor in the lobby of the House of Commons, but that he would not be found there in reality. Mr. T. then asked what sort of a man he appeared to be, when Mr. W. described him minutely. Mr. T. replied, "Your description is not at all that of the chancellor, but is very exactly that of Mr. Perceval, the chancellor of the exchequer." He then inquired whether Mr. W. had ever seen Mr. Perceval, and was told that he had never seen him, nor had ever had anything to do with him; and further, that he had never been in the House of Commons in his life. At this moment they heard a horse gallop to the door of the house; and immediately after a son of Mr. Williams entered the room, and said that he had galloped out from Truro, having seen a gentleman there who had come by that evening's mail from town, and who had been in the lobby of the House of Commons on the evening of the 11th, when a man called Bellingham had shot Mr. Perceval. After the astonishment which this intelligence created had a little subsided, Mr. W. described most minutely the appearance and dress of the man that he saw in his dream fire the pistol at the chancellor, as also of the chancellor. About six weeks after, Mr. W. having business in town, went, accompanied by a friend, to the House of Commons, where, as has been already observed, he had never before been. Immediately that he came to the steps at the entrance of the lobby, he said, "This place is as distinctly within my recollection, in my dream, as any room in my house;" and he made the same observation when he entered the lobby. He then pointed out the exact spot where Bellingham stood when he fired, and which Mr. Perceval had reached when he was struck by the ball, where he fell. The dress both of Mr. Perceval and Bellingham agreed with the description given by Mr. W., even to the most minute particulars.' This dream is related also by Dr. Abercrombie (p. 300), with a slight variation as to the time that elapsed between the dream and the announcement of the event, and with some additional circumstances.

The two following are among many instances mentioned by Dr. Abercrombie, who vouches for their truth. A Scotch clergyman, who lived near Edinburgh, dreamt one night, while on a visit in that town, that he saw a fire, and one of his children in the midst of it. On awaking, he instantly got up and returned home with the greatest speed. He found his house on fire, and was just in time to assist in saving one of his children, who in the alarm had been left in a place of danger. Two sisters had been for some days attending a sick brother, and one of them had borrowed a watch from a friend, her own being under repair. The sisters were sleeping together in a room communicating with that of their brother, when the elder awoke in a state of great agitation, and roused the other to tell her that she had had a frightful dream. 'I dreamt,' she said, 'that Mary's watch stopped; and that when I told you of the circumstance, you replied, "Much worse than that has happened; for —'s breath has stopped also,"'—naming their sick brother. The watch, however, was found to be going correctly, and the brother was sleeping quietly. The dream recurred the next night; and on the following morning, one of the sisters having occasion to seal a note, went to get the watch from a writing-desk in which she had deposited it, when she found that it had stopped. She rushed into her brother's room in alarm, remembering the dream, and found that he had been suddenly seized with a fit of suffocation, and had expired. (Abercrombie's *Intellectual Powers*, pp. 289-302.)

The following is written in the fly-leaf of an old copy of Cotton's Concordance, belonging to a friend of the writer of this article. Its circumstantial manner of narration entitles it to belief; and the prediction of the beheading of Charles

P C. No. 549.

I. and of the fire to the old woman is no more extraordinary than that of the death of Mr. Perceval to a gentleman who had never seen him, and was in no way connected with him. It is signed Richard Fiennes, to whom, it is to be presumed, the Concordance once belonged; and it is dated September 14th, 1666, the year of the fire of London. 'In the yeare 1653, on the 26th day of May, Mr. Fortescue of Ware, in the county of Devon, a person of greate honoure and sobriety, told me at Heanton in the said county, in the presence of my nephew, Roll, and other gentlemen of quality, that there was a woman of his knowledge, that was then living, that many yeares before the warres had a vision of them, and of the king's beleading, and amongst many other particulars, of the destruction of London. This I writt down in my Almanack for the yeare 1653, the same day it was told me with *Avertat Deus* under it; but it hath pleased God that for our sinne London is allsoe now consumed. I pray God we may all receive instruction by it.'

We shall conclude these instances with an account of two concurrent dreams furnished by Dr. Abercrombie, which were not, like those we have already given, followed by the event on which they are said to have turned, but of which the coincidence is very extraordinary. 'A young man, who was at an academy a hundred miles from home, dreamt that he went to his father's house in the night, tried the front-door, but found it locked; got in by a back-door, and, finding nobody out of bed, went directly to the bed-room of his parents. He then said to his mother, whom he found awake, "Mother, I am going a long journey and am come to bid you good bye." On this, she answered under much agitation, "Oh dear son, thou art dead!" He instantly awoke, and thought no more of his dream, until a few days after, he received a letter from his father, inquiring very anxiously after his health, in consequence of a frightful dream his mother had on the same night in which the dream now mentioned occurred to him. She dreamt that she heard some one attempt to open the front-door, then go to the back-door, and at last come into her bed-room. She then saw it was her son, who came to the side of her bed, and said, "Mother, I am going a long journey and I am come to bid you good bye;" on which she exclaimed, "Oh dear son, thou art dead!" But nothing unusual happened to either of the parties.' (p. 295.)

Instances of such dreams as these have been related in all times. The dream of Cæsar's wife, Calpurnia, the night before the assassination (Sueton. *Cæsar*, 81), is such an instance.

There are many dreams recorded both in the Old and the New Testament, which, together with the attendant circumstances, rest on very strong historical evidence, resembling the instances occurring in what is called profane history; and a supernatural agency being admitted in them, there is no reason why it should not exist also in other instances of dreams. For when once we allow the inadequacy of natural means for the explanation of a particular phenomenon, we cannot stop where we please, and say there is a reason why supernatural causes should have operated in this case, but there is none why they should have operated in that. In speaking of supernatural causes or of supernatural agency, phrases to which we attach no definite positive meaning, and which we can only explain negatively, we confess our inability to account for the manner in which an event or events came to pass; and if unable to account for the manner, we cannot take upon ourselves to explain the reason of the occurrence.

The supernatural interpositions to which, in our difficulty, we resort for aid, must, if they exist, be determined by general laws, which in the course of time it either may or may not be given to men to know. At present we see only the particular interpositions, particular events belonging to another system, which we call supernatural, which is governed, however, doubtless, like our own or the natural system, by general laws, and which moves perhaps co-ordinately with this to a common end; and knowing not the laws of that system, nor the connexion between it and our own, we can do no more at present than record the particular instances. It is certainly not philosophical to refer each particular interposition to a particular providence, as is done by Bishop Bull in his sermon concerning the 'Holy Office of Angels;' but in an admission of our own ignorance, combined with an opinion that the interpositions (as they are called) are regulated by general laws, there seems to be nothing to be objected to.

VOL. IX.—U

Many dreams which have in former times been accounted supernatural, as revealing facts and truths of science, may doubtless be explained by means within our own knowledge. We have spoken of Franklin's belief in revelations made to him during dreams concerning political events, and have given a natural explanation of their revelations. The dream which is related in Sir Walter Scott's Notes to *The Antiquary* would, there is little doubt, have formerly been considered supernatural.

There are several instances of dreams, similar to those related of himself by Franklin and that related by Sir Walter Scott, given by Henry More in his 'Immortality of the Soul,' (ii. 16.) all of which may be explained similarly; as, for instance, the dream of Avenzoar Albumaron, an Arabian physician, to whom his lately deceased friend suggested in his sleep 'a very sovereign medicine for his sore eyes.' Indeed all dreams of the appearance of ghosts, where they are believed to relate what may have been before known to the dreamer, may be explained by the two circumstances, that ideas in dreams are taken for sensations, and that trains of ideas associated together are not liable to be interrupted by sensations, as they are in sleep. Mr. Coleridge has very happily observed that, in the cases where ghosts are believed to appear in dreams, we have the idea of the person to whom the ghost belongs as being in the room in which we ourselves are sleeping; and further, that such ghosts always appear in a half waking state, when 'the impressions of the bed, curtains, room, &c., received by the eyes in the half moments of their opening, blend with, and give vividness and appropriate distance to, the dream image, which returns when they close again.' (*Literary Remains*, vol. i. p. 202.)

There is a long 'Essay on the Phenomenon of Dreaming' in Baxter's 'Inquiry into the Nature of the Human Soul,' the object of which is to prove that dreams are brought about by the agency of spirits. However fanciful is this object, the essay is valuable, as containing many facts and displaying much ingenuity.

The theory of dreams is treated briefly in Dr. Hartley's work, in Mr. Stewart's 'Philosophy of the Human Mind' (vol. i. chap. 8), in which, however, but little is done towards the elucidation of the subject, and in Dr. Beattie's 'Dissertations.' (Lond. 1783, 4to). Dr. Abercrombie's and Mr. Macnish's works are valuable for nothing else than the instances which they furnish. There is an article, occasioned by Mr. Macnish's book, and written by Sir William Molesworth, in the first volume of the 'London Review,' which shows great metaphysical acumen, and from which the reader will derive much instruction.

The works of Aristotle contain a short treatise on dreams (*capit. 'Evnervion'*); and many valuable observations, as well as fancies, are scattered through the poem of Lucretius. There is also extant, in Greek, a work on dreams by ARTEMIDORUS, besides the Oneirocritikon of Astrampsyhus, and that attributed to Nicophorus, a patriarch of Constantinople.

DRENTHE, a small province in the kingdom of Holland, bounded on the north by Groningen, on the east by the kingdom of Hanover, on the south by Overijssel, and on the west by Overijssel and Friesland. Drenthe lies between 52° 35' and 53° 12' N. lat., and between 6° 5' and 7° E. long. Its extreme length from north to south is 41 English miles, and its greatest breadth 39 miles. The soil of the province is in general poor in quality, comprising a large proportion of marsh-land and of sandy wastes. There are only three towns requiring mention, viz.: Assen, the capital, Meppelt, and Koeverden. Assen is about 22 miles south of the town of Groningen; the population in 1814 amounted to 1175 souls, and at present is about 1900. Meppelt, which is in the south-west corner of the province, is more populous, and contains about 5500 inhabitants, many of whom are employed in weaving canvass. Koeverden, situated on the small river Aa, in 52° 41' N. lat. and 6° 43' E. long., stands in a morass. It is a place of great strength, being considered the chef-d'œuvre of Coehorn and the key to the provinces of Overijssel, Groningen, and Friesland. It was besieged in 1672 by the bishop of Munster, and taken by him through the treachery of the governor; but it was soon after retaken by the Dutch. The population is about 2200. In the statistical publications of the Dutch government Drenthe is for most purposes included with the adjoining province of Groningen, so that it is not possible to offer any details of that nature. The

population of the entire province is about 50,000. [KAMPEN, &c.]

DRESDEN, the capital of the kingdom of Saxony (in the circle of Meissen), is situated on both banks of the Elbe, in 51° 8' N. lat., and 13° 34' E. long., at an elevation of about 410 feet above the level of the sea: it is equidistant from Frankfort and Hamburg, Vienna and Munich, Stockholm and St. Petersburg. The fine plain in which it stands is bounded on the east by the eminences which belong to the Saxon Switzerland and are mostly crowned with vineyards and gardens: on the south and south-west there are similar elevations, which are the termination of the Erzgebirge or Ore-mountains of Saxony and Bohemia, on this side. Westward lies the beautifully romantic 'vale of rocks,' or 'Plauische Grund,' through which the Weiseritz flows before it traverses part of Dresden and falls into the Elbe. On the north-western side of the city the Elbe winds round an enclosure planted with avenues of trees, and on the north the distance is bounded by a succession of hills, in general covered with firs and pines. Though Dresden does not rank among the largest, it is certainly one of the most agreeable and interesting capitals in Europe, and well deserves the appellation of the 'German Florence.' It is divided into three parts; on the left bank of the Elbe is Dresden Proper, or the 'Altstadt' (Old Town), with its three suburbs, and the 'Friedrichs-stadt,' which is separated from it by the Weiseritz: these two quarters form by far the larger portion of the city, and are disjoined from the third, or the 'Neustadt' (New Town,) by the Elbe, which is here 480 feet in breadth. In continuation of the New Town, there are some later erections, called the 'Neue Anbau,' or new buildings, which form a kind of suburb to it. The space gained by levelling the fortifications in the years 1810 and 1817 has been appropriated to gardens, promenades, and building.

Dresden contains altogether 11 gates or entrances, 27 public squares, 146 streets, and 20 churches and chapels, viz. 13 for Lutherans, 1 for Reformed Lutherans, and 6 for Roman Catholics; besides 5 synagogues. The population about two hundred years ago was inconsiderable, as the average births from 1617 to 1725 did not exceed 500 yearly: at the close of the eighteenth century however they rose to 1950, but at the commencement of the present fell to 1600. After the year 1815 they increased again to 1800, and in 1830 had reached 2000. In 1833-1834 the average of births was 2108, and of deaths 2093. In 1813 the number of inhabitants was 41,218; in 1831 it was 63,979; and at present it is upwards of 66,000. Of this number about 4200 are Roman Catholics, and 800 Jews: the remainder are Protestants. The houses, in number about 3000, are principally built of Pirna freestone, and in general are from five to six stories in height.

The old town, sometimes called Old Dresden, has four squares and 41 streets. The most interesting structure in this quarter is the royal palace, 1300 paces in circuit, which faces the west side of the bridge: it is an irregular building in the Gothic style, embellished with a church, which has the highest tower and steeple in the town. The chief parts of this edifice are the royal audience chamber, the Roman Catholic church, called a chapel, adorned with paintings by Rubens and Mengs, the chamber of ceremony (prachtzimmer) on the second floor, the porcelain-cabinet, the walls of which are ornamented with porcelain, the Proposition-Saal (hall of propositions), in which the sessions of the Saxon legislature are opened, the royal library, the hall of audience, with a splendid ceiling painted by Sylvester, and the parade-chamber, with paintings by the same master. The celebrated Grüne-Gewölbe (green vault) opens upon the palace-yard, and contains a costly collection of precious stones, pearls, and works of art in gold, silver, amber, and ivory, arranged in eight rooms, the painting of which is green, and the walls are decorated with mirrors laid into compartments of marble and serpentine stone. This collection, which was begun by King Augustus, and has been gradually increased by his successors, is estimated at nearly one million sterling in value. Close to the palace are the chancery building, the depository for the national archives, and the Stallgebäude (mews), in which there are four noble collections in art, namely, the armoury, the gallery of arms, the cabinet of casts and models, and the picture gallery. The armoury contains upwards of 20,000 specimens of armour, weapons, &c., principally from all ages in Saxon and

German history; the gallery of arms, a hall one hundred paces in length, comprises 2000 specimens of antient and modern arms, weapons used in hunting, &c.; the cabinet of casts was formed by Raphael Mengs, purchased by the late king, and enlarged by casts moulded by Bianconi of Rome. The picture gallery, in the upper story of the building, is composed of the outer gallery, which runs round the four sides of the Stallgebäude, the inner gallery towards the yard, and the Pastell-cabinet. The outer gallery contains above 500 paintings of the Flemish school, 90 of the Italian, and many of the French and German: the inner gallery is occupied by 366 specimens of the Italian school; and the Pastell-cabinet comprises 150 paintings of various masters. Near this building stands the Palace of Princes, in which are a handsome chapel, a gallery of portraits of princes of the Saxon and Bavarian lines, a porcelain cabinet, a library of 10,000 volumes, and cabinet of engravings. It is the residence of the co-regent, Prince John. A covered way leads from this palace to the opera-house, where there is space on the stage for 500 performers, and in the house itself for 8000 spectators. The square adjoining it is called the Zwinger; three sides of it are occupied by six pavilions connected by a gallery one story high; the quadrangle contains four fountains and three hundred orange trees. The six pavilions, which are profusely ornamented, contain a museum of natural history, consisting of four galleries and six saloons; a cabinet of engravings, comprising 200,000 plates and upwards, arranged in twelve classes; a collection of mathematical and philosophical instruments; a collection of works of art in ivory, alabaster, silver, iron, wood, &c.; a chamber of models useful in hydrography, mining, military architecture, &c.; and a miscellaneous cabinet.

The other buildings of note in the Old Town are the Brühl Palace, at present the residence of one of the royal family. It is the principal depository for the Meissen china; and behind it are spacious gardens and grounds, commanding delightful views of the banks of the Elbe and the surrounding scenery. Immediately adjacent are the hall, in which there is an annual exhibition of the productions of Saxon artists; the Academy of Arts and School of Design, and the Gallery of Duplicates, in which there are 260 paintings for which there was not sufficient room in the Great Gallery, and the celebrated tapestries worked after Raphael's designs. On one side of the square of St. Mary's church is the Mint; and adjoining it is the Arsenal, which contains a valuable collection of every kind of arms, and in one of the apartments, the portraits of all the Saxon sovereigns from Maurice to the present times. Facing the Arsenal stands the Academical Building, now used for a medical and surgical school; below it there is a subterranean hall decorated with paintings by Francisco Casanova. In the Pirna Street is the House of Assembly, a building of two stories, where the states hold their sittings and committees. The only handsome square in the Old Town is the Old Market Place, of which the town-hall is the great ornament. In this direction lie also the royal mansion and garden, now a botanical garden, New Post-Office, Kaufhalle (Trades' Hall), with its colonnade, Treasury, German theatre, two royal villas, with fine gardens and chapels, the Observatory and grounds attached, the Mews and Riding School, Military Hospital and gardens, and the Orphan Asylum and church. The most remarkable churches in the Old Town are, St. Mary's, built in 1726, after the model of St. Peter's at Rome; the Church of the Cross, a parallelogram, with a steeple 305 feet in height containing three tiers of columns; the Protestant church of St. Sophia, an irregular structure erected in 1351; and the Roman Catholic chapel or church of the court, begun in 1751 by Gaetano Chiavero, on which more than 30,000*l.* have been expended. This chapel is connected with the royal palace, has two side churches, and a pyramidically disposed steeple, with three tiers of columns, in all 302 feet high, and contains the vaults for the royal family, besides a multitude of paintings, statues, monuments, carvings, altars, &c.

Three suburbs are connected with the Old Town by means of as many avenues; the Pirna, See or Dohna, and Wildsurf suburbs. The first of these, which extends from the banks of the Elbe to the Kaidiz brook, has a long street, in which is the palace where the present king usually resides, with delightful grounds attached to it. The Botanical Garden, belonging to the Medical School, is close adjoining; and likewise Maurice's Avenue, on part of the

site of the former fortifications: this avenue derives its name from a piece of sculpture in stone, nearly three centuries old, exhibiting Maurice, the elector, and Augustus, his successor, with their consorts, as large as life; Maurice being represented as threatened by the scythe of death, and delivering his electoral sword to Augustus. In front of the external entrance into the Pirna suburb is the Great Garden, which is nearly five miles in circuit; and to the right lies the Nursery of Fruit Trees, which contains upwards of 65,000 plants, and a building in the centre, where concerts are held every week. The See suburb covers the south-west, and the Wildsurf the western side of the Old Town. From the last-mentioned suburb is an avenue called the Ostra-Allee, on one side of which are Prince Maximilian's palace, gardens, and observatory, and the buildings where the silver bullion is pressed, cut, and prepared for use at the Mint: this avenue opens upon a massive bridge across the Weiseritz, which leads to the Friedrichs-stadt (Fredericstown or Neu-Ostra), the second grand quarter of Dresden, between which and the Elbe are the wooded grounds, called the Ostra-Gehege. Here are the cemetery and infirmary for Roman Catholics, in which is Balzh; Permoser's monument to his own memory, chiselled by himself, and representing the Descent from the Cross; the Marcolini Palace and grounds, with an observatory, chapel, and collection of engravings, and drawings in sepia by Seidelmann, and in the grounds Mutielli's fine marble group of Neptune, drawn by sea-horses, and attended by marine deities and tritons, in the act of crowning Amphitrite with a wreath, the group serving as the channel for a cascade; the Freemason's Lodge; and a riding-house. This part of Dresden is inhabited almost entirely by mechanics and others of the lower classes.

The access from the old town to the new town, the third grand quarter of the city, which lies to the north east on the right bank of the Elbe, is across the palace square and celebrated stone bridge, called the Bridge of the Elbe, from its being the largest and handsomest structure of the kind which traverses that river. It is also denominated Augustus's Bridge, in honour of Augustus II., its founder. It is the work of Pöppelmann, rests on sixteen arches, is 1420 feet long and 36 broad, and was completed in the year 1731. The fourth pier, which was blown up by Marshal Davoust in 1813, was restored by the Russians in the following year. A cast-metal gilt crucifix, resting on a gilt copper globe placed on a mass of rustic stone about 28 feet in height stands upon the fifth pier. The bridge opens, on the new town side, upon an inclosed space, planted with linden-trees, 400 paces in length and 90 in breadth, and embellished with an equestrian statue of Augustus II., arrayed in the imperial costume of antient Rome, with a modern wig and field-marshal's baton, the work of Wiedemann, a coppersmith of Augsburg, and erected in 1723. A broad street, lined with linden-trees runs from the bridge to the northern extremity of the new town; on the western side of it is the Japanese Palace, and parade in front, and on the eastern a range of barracks for the cavalry and infantry, for 2300 officers and men, besides horses. The palace, now called the Augusteum, has this inscription in front, 'Museum usui publico patens,' and is the depository of four choice collections:—The Cabinet of Antiquities, founded in 1725, and arranged in 12 spacious and well-lighted rooms on the ground-floor, which contains some splendid statues and other remains of antient art; the Cabinet of Coins, founded in 1716, also on the ground-floor, and particularly rich in the coins of Saxony, as well as remarkable for a fine series of medals struck in honour of illustrious individuals of all countries; the Cabinet of Porcelain, displayed in 18 rooms, also on the ground-floor, and containing a rare and extensive collection of china, of Indian, Chinese, Japanese, Meissen, Sévres, &c. manufacture, besides specimens of Florentine and Roman mosaic work, Chinese decorations, Saxon works in marble, &c.; and the Royal Public Library, deposited in three saloons and 21 apartments in the first and second stories, and consisting of more than 220,000 volumes, 2700 MSS., above 160,000 pamphlets, and 20,000 maps. Among these are upwards of 1600 printed books of the fifteenth century. The new town also contains the Church of the Trinity; a Town-hall; the Cadet Academy; Engineers' School, and Academy for artillery cadets; and the commandant's residence and main guard. It has 22 streets in all. To the north-east of the new town lies what is called the Neue Anbau (new build-

ings), a part of the town once an unproductive waste, and first laid out as gardens by some Bohemian gardeners, who settled here in 1730, but the site of which is becoming gradually occupied by handsome residences. It contains a playhouse and baths, a house of industry, schools for the indigent and for the garrison of Dresden, and a spacious cemetery. The house for the reception of bodies of unknown persons has been lately decorated with the Dance of Death, a rude sculpture in stone containing 24 figures.

In the list of public establishments not hitherto noticed are a High School (the Kreutz-schule,) conducted by 12 masters, and attended by about 400 pupils; two schools for teachers, in which the deaf and dumb are taught; 23 free and elementary schools for about 3000 Protestant children; an asylum for the reformation of depraved children; three infant schools; several public schools for the children of the townsmen; the Schmalz foundation for educating poor children; and a public school for girls. Dresden contains altogether 71 establishments for Protestant education. The Catholics have a High School, the Josephina Foundation, for the education of the superior class of females, two ordinary schools, a free school, and a school for educating 12 soldiers' children, attached to the latter. To these should be added the Free Masons' School (with about 100 children) and a Veterinary School. The number of institutions for the sick and maimed and orphans is eight, including three hospitals. There are a variety of learned and other societies, the chief of which are the Academy of Arts, the Society of Economy, which promotes the various interests connected with Saxon industry, the Mineralogical, the Natural History and Medical, the Bible, the Missionary, and the Saxon Antiquities Societies. The number of benevolent institutions and societies of all descriptions is 78.

Dresden has no external trade or manufactures of much importance. It is a place of transit for colonial and other foreign produce from Magdeburg, Hamburg, &c., and has five general fairs, besides a yearly fair in June, at which a considerable quantity of wool is sold. Its mechanics have obtained some note in Germany for the manufacture of mathematical, mechanical, and musical instruments, engraving on steel and stone, the making of gloves, carpets, turnery ware, jewellery, straw hats, painters' colours, &c. These mechanics are incorporated into 60 fraternities. Morocco and other leather, refined sugar, tobacco, white lead, tin ware, glass, stockings, cotton goods, &c. are also manufactured, but not on an extensive scale. There is a foundry for bomb-shells and cannon, and a yearly exhibition of Saxon manufactures. The municipal expenses of the town are about 49,000 dollars (6900*l.*) a year.

The immediate vicinity of Dresden abounds in places of public resort, and its environs are full of attractions for strangers, among which we may notice the villages of Lochwitz, Kreischau, and Dohna, the scenery called the Schlotwitz, and Plauische Grund, the antient burg of Tharant, the vale of Seifersdorf, the Saxon Switzerland, Pillnitz, with its summer palace, and the village of Schandau.

DREUX, a town in France, the chief place of an arrondissement in the department of Eure et Loir. It is on the river Blaise, a tributary of the Eure, 41 miles from Paris, in a straight line west by south, or 50 miles by the road through Versailles and Houdan; in 48° 43' N. lat., and 1° 21' E. long. It is on the great western road to Alençon, Laval, Rennes, St. Brieuc, and Brest.

Dreux was known under the Romans by the name Durocasses, and appears to have been included in the territories of the Carnutes. From Durocasses the name was contracted into Droca, from which the modern form Dreux is derived. The town with the surrounding district, forming the county of Dreux, was included in the acquisitions made by the Northmen or Normans in France, but was early taken from them, and became part of the domain of the French crown. It continued, after several changes, to be held by a remote branch of the Bourbon family up to the time (we believe) of the French Revolution. In December, 1562, a severe action was fought in the plain of Dreux, between the rivers Eure and Blaise, between the royal Catholic army under the Constable Montmorency and the army of the Calvinists under the prince of Condé and the Admiral Coligny. The Calvinists were defeated, and the prince of Condé taken prisoner. In A.D. 1593, Dreux, which was in the possession of the party of the League, was taken by Henri IV. after a vigorous resistance of 15 or 18 days.

The town, which is in a pleasant country, is traversed by

the Blaise. On a hill which commands the town are the remains of the antient castle of the counts of Dreux: in the midst of these ruins rises the new chapel built on the site of a former collegiate church by the late duchess dowager of Orléans. The houses of the town are partly of brick, partly of wood, and partly of plaster: there is a small promenade, an alley of trees planted along the river, and called Boulevard. The town-hall is a Gothic building; and there is, beside the chapel mentioned above, a parish church, also Gothic: before the Revolution there were two parish churches. The population, in 1832, was 5166 for the town, or 6249 for the whole commune. The inhabitants manufacture serges, blankets, hosiery, and other woollen goods, hats, and leather: there are tan-mills and dye-houses: beside the articles which they manufacture, they carry on trade in sheep and cattle. There are three fairs in the year. There is a good hospital and a high school. The arrondissement of Dreux had, in 1832, a population of 70,532.

DRIFFIELD. [YORKSHIRE.]

DRILL, the course of instruction in which the soldier is taught the use of arms and the practice of military evolutions.

DRILL HUSBANDRY. [DRILLING.]

DRILLING is a mode of sowing by which the seed is deposited in regular equidistant rows, at such a depth as each kind requires for its most perfect vegetation. It has been practised by gardeners from time immemorial, and from the garden it has gradually extended to the field. In those countries where maize or Indian corn is extensively cultivated the seed is always deposited in rows; and during the growth of the plants the soil in the intervals is repeatedly hoed and stirred to a considerable depth, as is likewise the practice in vineyards. This cultivation not only keeps the land free from weeds, but by allowing the dews and the influence of the atmosphere to penetrate into the earth, greatly encourages the vegetation and growth of the plants.

It was no doubt from observing the effect produced by stirring the soil that Jethro Tull and his followers adopted the theory, that finely-divided earth formed the chief food of plants; and this led to the adoption of the row culture for every species of plant, and horse-hoeing the intervals, from which the practice obtained the name of the horse-hoeing husbandry. This was at one time thought so important a discovery as to be called the new husbandry, which was expected by its most zealous supporters entirely to supersede the old methods.

The system of Tull has been long proved to have been founded on erroneous principles. Tull himself was ruined by his experiment; and his warmest admirers, Du Hamel, Du Monceau, and De Châteaueuvier, were forced to admit its fallacy, after having suffered considerable loss by adopting its practice. But the advantage of sowing the seed in rows or drills has stood the test of experience; and the drill husbandry, by combining the advantages of continued tillage with those of manure and a judicious rotation of crops, is a decided improvement on the old methods of sowing all seeds broad-cast. The crops which are now most generally drilled are potatoes, turnips, beans, peas, beet-root, cole-seed, and carrots; and in general all plants which require room to spread, whether above or under the ground. The distance between the rows in these crops is generally such as to allow the use of a light plough or horse-hoe to be drawn by a horse between them without endangering the growing plants. The most common distance is twenty-seven inches, where the row culture is practised in its greatest perfection, which is in the north of England and in Scotland. The Northumberland mode of cultivating turnips, which is adopted by most scientific farmers, and seems to have decided advantages, consists in placing the manure in rows immediately under the line in which the seed is to be drilled, and keeping the intervals in a mellow and pulverized state by repeated stirring. In this mode of sowing the seeds vegetate more rapidly, and are sooner out of danger from the fly, and the crop is more certain as well as heavier. Should the turnips fail, which with every precaution will sometimes happen, the land has had the benefit of a complete fallow, and is well prepared for any other crop.

The instrument used for sowing turnips and other seeds in single rows is sometimes a small light wheel-barrow, which a man pushes before him; hence called a drill-barrow. It has a box in which the seed is put, with a slide to regulate

the quantity. This is allowed to fall on a wooden or metal cylinder below. In the circumference of this cylinder are several cavities where the seed lodges, and is carried down into a tin funnel below; the remainder is prevented from falling through by small brushes in which the cylinder turns. The motion is communicated from the wheel which runs on the ground to the cylinder by means of a chain on two pulleys placed on the axes of the wheel and cylinder.

The improved Northumberland drill, of which a figure is annexed, is a more perfect as well as more complicated instrument. It is supported on two wheels, and drawn by a horse. It sows ground bones, ashes, rape cake, or any other dry manure at the same time with the seed. The body of the drill consists of two boxes, A and B, divided by a partition between them, and each again divided into two by another partition at right-angles to the first. In the box A is put the manure, in B the seed. Iron slides are fixed in each compartment to regulate the supply of seed or manure. In the lower part of the boxes, and just before the opening, which is regulated by the slides, are two cylinders, one for the box A and another for B. On the cylinder in A are fixed shallow cups with short stems, which dip in the bones and carry a certain quantity over the cylinder as it turns, which falling in the funnels K K is deposited in the furrows made by the coulter H H. The cylinder in the box B has projecting pieces of iron, with a small cavity in each near the end, which takes up a very small quantity of seed, and discharges it in the same manner into the two funnels K K. On the axis of the wheel E is a toothed wheel, which turns

a small wheel D on the axis of the cylinder in A, and this turns another wheel C on the axis of the cylinder in B. As these two wheels move towards each other, the two cylinders turn in contrary directions, which is a convenience in throwing the seed and the manure into the funnels K K at the same time. The wheel F may be lifted up by means of a lever G, and then the cylinders do not revolve. There are various other contrivances which cannot well be explained without a more detailed figure of the different parts.

In some districts there is still a prejudice against the use of the drill even for turnips. In Norfolk, where the corn is usually drilled, the turnips are still very generally sown broad-cast. The cause of this appears to be, that as the cultivation of turnips was first introduced from Flanders into Norfolk, and in Flanders turnips are never drilled, because there they are generally sown as a second crop immediately after rye harvest, they have continued the old method first introduced, and the labourers are become very skilful in setting out the plants at proper distances with the hand-hoe. In the north they were introduced at a later date, and the improved mode of sowing in rows was immediately adopted. The Norfolk farmer insists that the barley, usually sown after turnips, is better when the manure has been equally distributed than when it lies in rows, as the land is only slightly ploughed after sheep have been folded on the turnips, and the manure remains in stripes. On the whole, however, drilling in the Northumberland method seems to be the best practice, and is adopted very generally by all scientific farmers

Northumberland Turnip Drill, drawn from one manufactured by Messrs. Cottam and Hallen, Winsley Street, Oxford Street, London.

On light friable soils, drilling the seed is very generally adopted. There is a neatness in the appearance which recommends it to the eye; and machines have been so improved, that the seed is sown more regularly and is better covered than it could possibly be by the best broad-cast sower followed by the harrows. In very stiff heavy soils, and in moist seasons, it is not so practicable to use the drill. It is sometimes impossible to get the land sufficiently dry and pulverized to allow of drilling to advantage; and when the land is wet the tread of the horses would greatly injure it. If wet clay soils were more generally underdrained, and the subsoil plough were used to loosen them to a considerable depth, they might be rendered so dry and friable that the drill could be used at all times.

In poor sandy and gravelly soils where bones have been found of so great advantage as a manure, drilling is the only mode by which the bones and the seed can be sown in contact with each other; an important circumstance. When the ground has been well prepared and laid into stitches of a convenient width, a whole stitch may be drilled at once, with so much regularity, that an instrument with as many hoes as there are drills, and of the same width, may be drawn over the land to stir all the intervals, without

danger of injuring the plants. This requires great practice and attention; but it may be considered as the perfection of the drill system. Where drilling seed is generally adopted, and the farms are not so large as to make it prudent for the occupier to purchase expensive instruments, drilling is become a separate profession. An industrious man with a small capital buys improved drills, and undertakes to drill the seed at a certain price per acre. The farmer finds horses and seed, and the driller finds the machine, and attends to the management of it himself. By constantly doing the same thing he becomes very expert; and in a neighbourhood where there are many small occupiers, a good drilling-machine, which costs from 30*l.* to 50*l.*, procures the owner a very good livelihood during the whole season of sowing; and if the instruments for hoeing were more generally used, the profession of a hoer of land might be advantageously united to that of the driller. Corn is generally drilled at the distance of eight or nine inches; and a machine which drills twelve rows will cover a stitch ten feet wide. Some prefer the rows to be nearer, but in that case the hoeing is not so easily performed with a machine, and it is done by hand. The most improved machine for drilling is Cook's patent lever drill, which sows

Cook's, or Suffolk Patent Drill, drawn from one manufactured by Messrs. Cottam and Hallen, Winsley Street, Oxford Street, London.

from ten to fifteen rows at once. The description of the Northumberland turnip-drill will make the construction of Cook's drill more easily understood. In the annexed figure the box for sowing manure is not added, as it is in the Northumberland drill. The drill is supported on a frame and two wheels. The box A, which holds the seed, lets it down gradually into a lower part, in which the cylinder, which has the small cups fixed to its circumference, is turned by the wheel D. By means of the lever G this may be raised so that its teeth are freed from those of the wheel E, and the motion of the cylinder is stopped. The coulters which make the drills are each fixed to a lever, at one end of which, B, a weight is fixed to press the coulter into the ground. Each coulter has a separate lever, so that it adapts itself to all the inequalities of the soil. A chain proceeds from the end of each, and may be wound round a cylinder C by turning the handles fixed to it at H, where there is also a ratchet-wheel to prevent its unwinding. The intent of this is to raise all the coulters out of the ground, when the drill is not intended to act, or is moved from place to place. When the drill is used, the box A is filled with seed, and the slide in it so adjusted as to supply it regularly; the lever G, which was fixed down, is raised, and the wheel D connected with the wheel E. As the horses proceed, the cylinder turns, the cups take up the seed, and throw it into the funnels K K, which conduct it to the drill behind the coulter. A light harrow, or a bush-harrow, follows, which covers the seed. In very loose soils the roller completes the operation.

DRIMYS. [CANELLA ALBA; WINTERA.]

DRIN, or DRINO. [ALBANIA.]

DROGHEDA is a seaport town, forming with its liberties the county of the town of Drogheda, in the province of Leinster in Ireland, situated between the counties of Meath and Louth, upon both sides of the river Boyne, about four miles from its entrance into the Irish channel, and 23½ Irish or 29¼ English miles from Dublin.

The town and liberties occupy the parish of St. Mary's, towards Meath, on the south side of the river, and the parish of St. Peter's, and part of the parish of Ballymakenny, towards Louth, on the north side of the river. The total area of the town and liberties is 5802 statute acres. The recent boundary act has not made any alteration in these limits.

The name Drogheda, of which Tredagh (as it is generally written in old books) is a corruption, signifies the bridge of the ford. A synod was held here by Cardinal Paparo, the Pope's legate, in 1152; which was very numerously attended by the Irish ecclesiastics, and at which the authority and discipline of the church of Rome were greatly strengthened in Ireland. After the conquest, the first care of the English seemed to have been the erection of a sub-

stantial bridge, as appears by a grant of pontage made in 1228 by Henry III., who in the same year also divided the town into two parts, viz., Drogheda versus Uriel, on the Louth side of the river, and Drogheda versus Midiam, on the Meath side. In 1412, the division of the town into two corporations being found productive of much animosity between the inhabitants of the opposite sides of the river, was repealed by Henry IV., since which time Drogheda on both sides of the Boyne has continued to be one body corporate. Being a frontier town of the pale, Drogheda was a principal rendezvous for the forces which were so frequently required in Ulster between the fourteenth and seventeenth centuries; and many of the Irish parliaments were held here, particularly during the fifteenth century. In the parliament which met at Drogheda in 1494 was passed the statute called Poyning's Act, which made it necessary to the validity of all future acts of the Irish parliament that the bills should first be certified as fit for the consideration of that assembly by the king in council (10 Hen. vii. c. 22). By this act the freedom of the Irish legislature was virtually destroyed, and in this state of subjection it continued until the assertion of independence by the Irish volunteers in 1782.

A mint was at this time established at Drogheda, and the town appears to have been a place of much greater importance than at any subsequent period.

On the breaking out of the rebellion of 1641, Drogheda was besieged by Sir Phelim O'Neill, and a large force of Irish, who invested the town on both sides on the 1st of December. The garrison consisted of only about 1000 men, under Sir Henry Tichborne and the Lord Moore, who having taken an oath to defend the place to the last extremity, not only repulsed several attacks of the Irish, but succeeded in capturing large booties and doing great damage to the rebels in numerous sallies, until the 28th of February, when they finally forced them to raise the siege.

On the arrival of Cromwell in Ireland in 1649, the Marquis of Ormond placed a garrison of nearly 3000 men in Drogheda, under the command of Sir Arthur Aston; and satisfied of its security, withdrew into the midland counties to recruit. Cromwell left Dublin on the 30th of August, and came before Drogheda on the 2nd of September, but, owing to some delay in the arrival of his artillery, which he had sent round by sea, he did not open any battery till the 9th. On the 10th, at 5 o'clock in the afternoon, having effected a breach, without the delay of making regular approaches, he gave the assault; and although twice repulsed, succeeded on the third attempt, which he led himself, in carrying the town. Quarter was promised by his officers and men, and the bulk of the garrison are said to have laid down their arms on that assurance: nevertheless they were all put to the sword, with the exception of a very few who escaped by the north gate, and about thirty whom Cromwell after-

wards transported to Barbadoes. Drogheda was last held for the Roman Catholic party by the Lord Iveagh, with a garrison of 1000 men, in 1690, but it surrendered to a detachment of King William's army the day after the battle of the Boyne. [BOYNE.]

The old walls and four gates were standing within the last fifty years. A few buttresses and St. Laurence's gate are all that now remain. The last is a striking object, and is in good preservation. Drogheda is rich in ecclesiastical antiquities. The Dominican Friary on the north part of the town was founded by Lucas de Netterville, archbishop of Armagh, in 1224, and is celebrated as the scene of the submission of four Irish princes to Richard II. in 1394. A lofty tower of this friary, called the Magdalen Tower, is still standing, together with some of the cloisters. The ruins of the Carmelite Friary, founded in 1240, on the south side of the river, are still to be seen on the right hand of the great northern road coming from Dublin. The present parish church of St. Mary's is partly built on these ruins. The Franciscan Friary on the north-east of the town is standing, although much ruined, and forms a striking feature in the view of Drogheda from the approaches on the Dublin side. A gable and bell-tower, with part of the aisle, of the Priory of Canons Regular also remain on the west of the town near the river; and there are some traces of the Priory of St. Laurence near the gate, and of the Hospital of St. Mary, beyond the Canons Regular. Besides these, there was an Augustinian Priory, founded before the coming of the English, of which no trace now remains; as also the Priory of St. John, and the religious houses of St. James and St. Bennet. The possessions of the Augustinians and Carmelites, as also of the Priory of St. Laurence and the house of the blessed Mary de Urso, came into the hands of the corporation by charter of 3 and 4 Philip and Mary, A.D. 1557.

Drogheda is governed by a corporation, consisting of mayor, sheriffs, 24 aldermen, and an unlimited number of freemen. This body is nearly self-elected, and has uniformly acted on the principle of excluding Roman Catholics. They hold their authority under numerous charters, from the 12th of Henry III. to the 3rd of William IV. Assizes for the county of the town are held here twice a year before the mayor and the judges of assize. Drogheda is the first town on the north-east circuit. A civil bill court is also held here twice a year before the assistant barrister of the county of Louth. Petty sessions are held once a fortnight. The gaol of the county of the town, on the road to Tírfeacán, was lately built by grand jury presentment, and is in good condition, though sometimes deficient in accommodation. Drogheda is watched and lighted by rates imposed under acts of parliament. The expenses of paving, within the walls, are defrayed by the corporation: the roads and streets without the walls are repaired by grand jury presentments. The expense of watching in 1833 was 310*l.* 10*s.* 7*d.*; of lighting, 320*l.*; of paving within the walls, 213*l.* 13*s.*; and of repairing roads, &c. without the walls, 135*l.* 6*s.* 5*d.* Drogheda returns one member to the Imperial Parliament.

The port and harbour are under the direction of harbour commissioners, constituted by 3 Geo. III. c. 39, and 7 and 8 Geo. III. c. 85. These and the corporate authorities under whose control the harbour was formerly, have received from time to time a sum of 6000*l.* for the improvement of the quays and river. Their receipts in tonnage dues for 1834 amounted to 11,668*l.*, and in 1835 to 5829*l.* Vessels of 250 tons come up to the bridge, and the channel of the Boyne is capable of great improvement. The amount of postage collected at Drogheda in each year from 1833 to 1836 was as follows:—1833, 1935*l.* 14*s.* 3*d.*; 1834, 2040*l.* 15*s.* 5*d.*; 1835, 2057*l.* 18*s.* 5*d.*; 1836, 2244*l.* 7*s.* 1*d.*

The increase under this head shows that the trade of the town is reviving.

This corporation is subject to the 'New Rules' of the 25th of Charles II. [CORPORATIONS OF IRELAND.] Their estates consist of 2032 acres, besides houses and tenements, producing an average annual revenue of 4500*l.* It is estimated that these estates, if out of lease, would now let for 12,000*l.* per annum. They are principally tenanted by members of the corporation, who, up to 1833, were alone permitted to become tenants, and who still enjoy peculiar advantages in renewing their leases.

Drogheda is a compact and well-built town; but the miserable suburbs extending north and south greatly disfigure the approaches. The chief part of the town lies on

the northern side of the river, which is the higher ground. The principal street runs nearly north and south, and forms a portion of the great northern road. Other good streets branch east and west. About the centre of the town, on the western side of the main street, stands the town-house, a handsome building with a clock and cupola; and north of this, on the opposite side of the main street, is the parish church of St. Peter, a respectable edifice of cut stone, with a spire designed by Johnston. The Roman Catholic chapel of St. Peter is capacious and well-built; and there is a handsome Presbyterian meeting-house, and a Methodist chapel of chaste architecture. Besides these there are four other Roman Catholic chapels, and two nunneries; one of the latter, called the Sienna Nunnery, near the site of the Franciscan Priory, is a large establishment. There are two barracks.

There is a considerable import of coal from Workington and Whitehaven. It sells at from 12*s.* to 14*s.* per ton; but even this low price precludes the purchase of coal by the poorer classes, who in many instances burn little else than weeds and brambles.

The linen manufacture, about twenty years ago, was the staple trade of Drogheda. The articles manufactured were dowlas, sheetings, and a narrow web called market linen. The number of weavers in the county of the town at that time was about 2000. The quantity of linen sealed in the Drogheda market in 1820 was 53,697 pieces; and in 1821, 61,866 pieces: the average of the years from 1830 to 1834 (both included) was only 19,495 pieces. The number of looms now employed in Drogheda and the country around does not amount to 1000; the number of weavers at present (1837) employed in the town is not much more than 200; and the wages they earn rarely amount to 5*s.* per week. The lower class of the population are miserably poor; and as numerous vagrants pass through the town to and from Dublin, the streets are constantly filled with beggars, who collect in crowds round the different stage-coaches when changing horses, and seriously annoy travellers upon the northern road. A mendicity institution was established in Drogheda in 1821; the corporation give a house rent free, and the establishment is supported by voluntary contributions. The expenditure from the 1st May, 1831, to the 25th June, 1833, was 812*l.* 8*s.* 2*d.*; and the receipts were 786*l.* 2*s.* 2*d.* There is also an almshouse, with a rental of 241*l.* 12*s.* 6*d.*; and an hospital for the county of the town, constituted under the provisions of 47th Geo. III. c. 50, which receives 90 in-door patients, and gives dispensary relief to about 4000 poor annually. It is supported by a grant of 50*l.* per annum from the corporation, by voluntary contributions, and grand jury presentments: total receipts for 1833, 364*l.* 10*s.* 3*d.* There is a savings bank, in the town, the deposits in which are increasing. The total number of depositors in 1835 was 671; gross amount of lodgments 17,729*l.* 19*s.* 7*d.*

There has been little or no increase in the population of Drogheda since the year 1798, when the lists which the inhabitants were obliged to put up on their doors gave a population of about 17,000. In 1821 the numbers were, males, 8702; females, 9416; total, 18,118: and in 1831 the numbers were, males, 8178; females, 9187; total, 17,365; showing a considerable decrease, which has been attributed partly to the emigration of decayed weavers, and partly to the mortality caused by the cholera, which, since 1831, is estimated to have carried off upwards of 1500 inhabitants. In the latter year, the number of males upwards of twenty years of age returned as employed in manufactures, or in making manufacturing machinery, was 946; of whom 153 are stated to be employed in the linen manufacture, 788 (not accurately classed) in the cotton and linen manufacture, and 5 in the manufacture of tobacco.

In 1821 there were in the county of the town of Drogheda 1147 young persons receiving daily instruction, and in 1834 the numbers were—

| Parish. | Schools. | Males. | Females. | Total. |
|-------------------|----------|--------|----------|--------|
| St. Mary's . . . | 1 | 56 | 16 | 72 |
| St. Peter's . . . | 11 | 468 | 552 | 1010 |
| Ballymakenny . . | 1 | 45 | 12 | 57 |
| | | 559 | 580 | 1139 |

Of these schools three are in connexion with the National Board; and one, upon Erasmus Smith's foundation, has an income of 280*l.* per annum. The statute 5 Ed. IV. c. 46 grants a university to Drogheda; but the provisions of the act have never been carried into effect.

The town expenses are defrayed by grand jury assessments. The total sum so levied in 1833 was 1863*l.* 14*s.* 3*d.* An obscure work, entitled 'A History of Drogheda,' was published some time ago in this town; but as yet this part of Ireland has not been made the subject of adequate historical illustration.

(Cox's *History of Ireland*; Temple's *History of the Ex. Irish Rebellion*; Bernard's *History of the Siege of Drogheda*; *Parliamentary Papers*, &c.)

DROHOBYCZ or **DROHOVITSCH**, a royal town in the circle of Sambor, in the Austrian kingdom of Galicia, situated on the Tyszmanika, a tributary of the Dniester. It lies in 49° 22' N. lat., and 23° 35' E. long. A great portion of the houses are filthy cabins, without chimneys, constructed of boards. The town however has several buildings of consequence, among which are the high-church, a fine structure of the Gothic order, a Basilian monastery, with a grammar-school conducted by the brotherhood, a chapter-house, several churches, a synagogue, castle, and seminary for teachers. The town, with its eight suburbs, contains about 1200 houses, and 7250 inhabitants. The royal salt-works, including the adjacent works at Mobraze, Solec, and Stebnik, produce about 3700 tons annually, which are extracted from salt rocks and saline clay. There is a brisk trade in native and foreign produce, particularly wine, linens, cottons, leather, and grocery, which is mainly carried on by the Jews, who form full seven-eighths of the population; and the corn and cattle markets bring much profit to the place.

DROITS OF ADMIRALTY are the perquisites attached to the office of Admiral of England (or Lord High Admiral), and belonging, when that office is vacant, to the crown. Of these perquisites the most valuable is the right to the property of an enemy seized on the breaking out of hostilities. Large sums were obtained by the crown on various occasions in the course of the last war from the seizure of the enemy's property, most of which however was eventually given up to the public service. By the last arrangement of the civil list (1 Will. IV. cap. 25), whatever Droits of Admiralty may accrue during the present reign are to be paid into the Exchequer for the use of the public. The Lord High Admiral's right to the tenth part of the property captured on the seas has been by statute relinquished in favour of the captors.

DROITWICH. [WORCESTERSHIRE.]

DROME, a river in France, belonging to the basin of the Rhône. [DRÔME.]

DROME, a department in the south of France, bounded on the north and north-east by the department of Isère, on the east by the department of Hautes Alpes; on the south-east by the department of Basses Alpes, and on the south by the department of Vaucluse: on the whole of the west side it is bounded by the river Rhône, by which it is separated from the department of Ardèche. The form of the department is irregular: its greatest length is from north-north-west near the village of St. Rambert, on the Rhône, to south-south-east, near the village of Ferrassières de Monbrun, 88 or 90 miles; its greatest breadth, at right angles to the length, is from Pierre-latte, on the Rhône, to the neighbourhood of Lussettes, on the Buëch, 60 miles. It is comprehended between 44° 6' and 45° 20' N. lat., and 4° 36' and 5° 45' E. long. The area is given by M. Malte Brun at 336 square geographical leagues, or 2570 square miles; about the area of the English county of Devon. The population in 1832 amounted to 299,556, about three fifths of the population of Devonshire. The area of the department is above the average of France, but the absolute and relative population (117 to a square mile) are both considerably below the average. Valence, the capital, is on the Rhône, 295 or 296 miles south-south-east of Paris, in a straight line, or 352 miles by the road through Melun, Auxerre, and Lyon.

The eastern side of the department is mountainous, being occupied by the branches sent off from the mass of the Alps. This mountainous tract occupies two-thirds of the department. The mountains are for the most part calcareous or argillaceous: the highest, which are on or near the eastern boundary of the department, have an elevation of about 5800 feet: they become lower toward the west, and gradually subside into the valley of the Rhône. Two of the mountains, the Inaccessible Mountain and Mount Devez, are reckoned among the curiosities of this part of the country. The Inaccessible Mountain is re-

markable for its form, being in one part narrower at the base than at the summit, which gives it the appearance of an inverted pyramid: the Mount Devez is considered to be the cause of a healthy breeze which pervades the territory of Nyons; it is said to be occasioned by the condensation of the vapours from the neighbouring mountains, which are, for a part of the year, covered with snow. The mountainous tract is intersected by valleys, communicating with each other by narrow and dangerous bye-roads, and watered by streams, which, when swollen by the melting of the snows, overflow their banks and occasion great devastations. These rivers are numerous, but none of them are very considerable.

The Rhône bounds the department on the western side for a distance of seventy miles, for the greater part of which its channel is full of small islands. It carries off the drainage of the whole department: its tributaries rise in the mountains of the eastern district, and flow westward into the main channel. The valley of the Rhône contains the most condensed population, and several of the principal towns are on its banks.

The Isère, one of the most important of the tributaries of the Rhône, which rises in the highest part of the Alps, near Mount Iseran, crosses the department in the northern part and falls into the Rhône on its border. About eighteen or twenty miles of its course belong to this department.

The Drôme rises on the eastern boundary of the department, and flows north-north-west about twenty-two miles to Die, receiving the little river Bes, or Bez, and some other streams by the way: from Die it flows seven or eight miles west to Pontaix, and from thence south five or six miles to the junction of the Rouane, or Roanne, which receives the Ribière, or Ribierre: from the junction of the Rouane the Drôme flows twenty-five miles west into the Rhône, receiving several streams by the way. Its whole course may be estimated at about sixty miles, all within the department: it is not navigable, but is used for floating timber below Luc sur Diois, about twelve miles from its source. From Luc to Die the timber is floated in rafts of twelve to fifteen trunks: from Die to Pontaix in single trunks, on account of the rocks which obstruct the bed of the river: below Pontaix the timber is again collected and formed into rafts. The Bez is also used for floating.

The other rivers of the department are very small. In the part northward of the Isère are the Suzon (twenty-five miles long, chiefly belonging to the department of Isère), the Bancel, and the Galaure, which all flow into the Rhône, and the Herbasse, which flows into the Isère. In the country between the Isère and the Drôme are the Bourne, which flows into the Isère; the Vernaison and Lyonne, which flow into the Bourne; the Leoncel, which joins the Lyonne; and the Veoure, which flows into the Rhône.

In the country south of the Drôme are the Roubion and the Jabron, which unite at Montelimar, and fall into the Rhône just below that town: the Berre, which falls into the Rhône near Pierre-latte, and the Lez, the Aigues, and the Ouvèze, which all join the Rhône in the neighbouring department of Vaucluse. The Lez receives the Leron and some other streams, the Aigues receives the Oulle and the Zeynnées, and the Ouvèze receives the Tolerene. The Rhône and the Isère are, we believe, the only navigable rivers. There are no canals in the department.

The great road from Paris by Lyon to Aix, Marseilles, and Toulon, crosses the department from north to south, passing through the towns of St. Valier, Tain, Valence, Livron, Loriol, Montelimar, and Pierre-latte. From Valence a road runs north-east through Le Péage and Romans to St. Marcellin and Grenoble, in the department of Isère: another road, from Pont St. Esprit, on the Rhône, into the department of Hautes Alpes, and by Mont Genève into Italy, just crosses the southern part of this department through Nions or Nyons. The other roads are all bye-roads.

The department is very deficient in the means of communication with other parts.

The calcareous and argillaceous strata which occupy the mountainous tract in the east of the department occupy also the valley of the Rhône from the neighbourhood of the Drôme southward: the banks of the Drôme, the valley of the Rhône north of that river, and the valley of the Isère, are occupied by the strata which are found above the chalk. The mineral treasures of the department are considerable; there are mines of copper and one mine of iron: granite, potters' clay, gypsum, coal, and fossil coal, are obtained;

and peat is dug for fuel. There are several mineral springs, but none of much repute.

The soil varies much; a considerable portion of it is so bad as to be hardly susceptible of cultivation. The highest parts of the mountains afford pasturage, but not wood; and the slopes, which might be expected to produce wood, present commonly nothing but bare rocks and sterile hollows. But industry and care in manuring the land have rendered this department important, not only by the amount but the variety of its produce. The quantity of corn grown is not sufficient for home consumption; but there are olives, almonds, walnuts, and excellent wines, especially those of Tain (Hermitage, Côte Rôtie, &c.), L'Etoile, and Die. The neighbourhood of Romans and some other places yield truffles, which are considered nearly equal to those of Périgord. There are rich meadows and good pasture grounds, to which the flocks and herds of Provence are driven in the summer. Forests, chiefly of pine and beech, occupy nearly a seventh part of the department. Plantations of mulberry-trees, in which many silk-worms are reared, are numerous. Horses and neat cattle are not numerous; sheep are more so; the mules are small, the asses of good quality. The chamois, the wild goat, and a few bears, are found in the mountains. Game is abundant, but the rivers do not afford any great quantity of fish. The air is pure and healthy, and rather cold, except along the valley of the Rhône, where the heat in summer is very great.

The department is divided into four arrondissements: that of Valence, in the north, population 135,193; that of Die, in the east, population 65,663; that of Nyons, in the south-east, population 36,170; and that of Montelimar, in the south-west, population 62,530. The number of communes is 361, which are arranged in 28 cantons or districts, in the jurisdiction of a *juge de paix*. The chief towns are Valence, the capital, on the Rhône, population 8898 for the town, or 10,406 for the whole commune; Romans, on the Isère, population 7677 for the town, or 9285 for the whole commune; and Montelimar, near the Rhône, population 5816 for the town, or 7560 for the whole commune. [MONT-ELIMAR; ROMANS; VALENCE.] Of the smaller towns we subjoin some account.

In the arrondissement of Valence are Moras (population of commune 4053); Le Grand Serre, near the Galaure; Saint Vallier (population estimated at 2000), and Tain (population 2139 for the town, 2340 for the whole commune), both on the Rhône; Montrigaud and St. Donat (population of the town 1591, of the whole commune 2084), both on the Herbasse; Montmiral; Le Péage (population 3095 for the town, 3577 for the whole commune), on the Isère; Alixan; Montellier; St. Jean de Royans, on the Lyonne; Chabeuil (population of commune 4452), on the Veoure; Etoile; Livron (population 1719 for the town, 3275 for the whole commune) and Loriol (population 1784 for the town, and 3048 for the whole commune), both on the Drôme; and Mirmande. St. Vallier is in a pleasant country; it has a Gothic château: the inhabitants are engaged in throwing silk, weaving linens, silks, and crape, pressing oil, and making porcelain and hats. Tain has an antient altar. A bridge of iron wire, completed in 1825, connects this town with that of Tournon on the opposite side of the Rhône. The wines of the neighbourhood have been noticed. Potter's clay is dug near the town.

At St. Donat some silk manufactures are carried on. Le Péage, though forming a separate commune, is really a suburb of Romans. Chabeuil is a place of considerable business; it has corn, oil, paper, and fulling mills, and some manufactories for woollen cloths. Livron and Loriol, on the opposite banks of the Drôme, just above its junction with the Rhône, are connected by a fine bridge.

In the arrondissement of Die are, Die, the capital (population 3213 for the town, 3555 for the whole commune), Pontaix, Saillans, Aouste, and Crest (population 3895 for the town, 4901 for the whole commune), all on the Drôme; Chatillon on the Bez; Beaufort; Bordeaux, Saou, and Puy St. Martin, on or near the Roubion; and La Motte Chalançon on the Oulle.

Die was known in the time of the Romans by the name of Dea Vocontiorum, being in the territory of the Vocontii. [DAUPHINÉ.] It is not noticed by any of the antient geographers, but is found in the 'Itinerary' of Antoninus, and in that from Burdigala (Bordeaux) to Hierosolyma (Jerusalem), and in the Theodosian Table. In the middle ages it was the capital of Diois, one of the subdivisions of Dauphine.

phiné, and the seat of a bishoprick established in the fourth century, and for a long time united to that of Valence, but separated from it by Louis XIV. after the revocation of the edict of Nantes; it has been since suppressed. Die suffered much during the religious wars of the sixteenth century from the Huguenots: these seem to have retained a predominance in the town, as they had, previously to the revocation of the edict of Nantes, an academy here. The 'Dictionnaire Universel de la France' (Paris, 1804) enumerates as its manufactures paper, thrown silk, fustian, and cotton goods.

Crest was successfully defended in the crusade against the Albigenes by Aimar, count of Valence, who supported the count of Toulouse against the Catholics under Montfort. It has an antient castle in a picturesque situation on the brow of a hill commanding a delightful prospect. This castle has been used as a state prison. The town is at the foot of the castle hill. The inhabitants are engaged in the manufacture of woollen cloth, cottons, and silks; in dyeing and fulling cloths, and in pressing oil. (*Dict. Univ. de la France*, Paris, 1804; Vaysse de Villiers, *Itinéraire Descriptif de la France*, Paris, 1813.)

Aouste, which is mentioned in the Itineraries under the name of Augusta, and at which paper is made and oil expressed; Saillans, at which some silk and cotton manufactures are carried on; and Pontaix, at which some woollens are made, are all on the road between Crest and Die. At Beaufort, Bordeaux, and Saou, woollen goods are manufactured.

In the arrondissement of Nyons are only two towns, Nyons on the Aigues (population 2700 for the town, or 3397 for the whole commune), and Le Buis, on the Ouvèze (population 1886 for the town, or 2180 for the whole commune). Nyons is at the foot of Mount Devez, upon the slope of which it is partly built, and is divided into three quarters, each of which has an old wall inclosing it. It has a bridge built by the Romans, and in the environs are the ruins of an old castle demolished by the order of Louis XIII. Nyons was in the middle ages the frequent residence of the Dauphins of Viennois. The inhabitants are engaged in throwing silk and in making woollen stuffs and soap. It was the birth-place of Phillis, daughter of the Marquis de la Charce, a lady who, in 1692, put herself at the head of the inhabitants of the neighbourhood, and aided in repelling an invasion of the Savoyards. At Le Buis silk and leather are manufactured.

In the arrondissement of Montelimar are Marsanne, Dieu-le-fit on the Jabron (population of the town 3010, of the whole commune 3952), Châteauneuf du Rhône, Donzère, and Pierre-latte (population of the town 2388, of the whole commune 3447), all on the Rhône; Taulignan and Grignan, both near the Lez; and St. Paul-trois-Châteaux. Dieu-le-fit has in its neighbourhood three mineral springs: potter's clay and ochre are dug. Pottery and other earthenware, hats, woollen goods, and silks, are made in and about the town. Donzère produces wine, which has tolerable reputation. Pierre-latte is at the foot of a large rock, from which some would derive its name, Petra latra, or wide rock. At Taulignan and Grignan some silk manufactures are carried on: Grignan had formerly a castle, one of the finest in this part of France, now destroyed. Madame de Sévigné died at Grignan; her tomb remains in the church. St. Paul-trois-Châteaux was known to the Romans by the name of Augusta Tricastinorum, and was the chief town of the Tricastini. [DAUPHINÉ.] It was in the middle ages the seat of a bishoprick founded in the fourth century; the bishop was a suffragan of the archbishop of Arles. It has some slight remains of antiquity. The inhabitants carry on trade in fine oil, wine, and silk.

The department of Drôme sends three members to the Chamber of Deputies. It constitutes the diocese of Valence, the bishop of which is a suffragan of the archbishop of Avignon: it is in the jurisdiction of the Cour Royale, or supreme court, of Grenoble, and in the district of the Académie Universitaire, or academical council, of that city: it is comprehended in the seventh military division, of which the head-quarters are at Grenoble. It was formerly included in Dauphiné.

The inhabitants of this department are of middling stature, active, robust, lively, and brave, but not disposed to labour. They are long-lived. Education is more attended to than in the majority of the French departments: there is one boy at school for every twenty inhabitants. (*Dictionnaire*

Universel de la France, Paris, 1804; *Dictionnaire Géographique Universel*, Paris, 1827; Vayssé de Villiers, *Itinéraire Descriptif de la France*, Paris, 1813; Malte Brun, Balbi, &c.)

DROMEDARY. [CAMEL, vol. vi., p. 191.]

DROMIA (Fabricius), a genus of brachyurous decapod crustaceans, placed by M. Latreille in the section of *Notopoda*, and referred by Dr. Leach to the family of *Thelxio-poda*.

Generic character.—External antennæ small, inserted below the ocular peduncles; the intermediate antennæ placed below and a little within the eyes: external *jaws*—feet with their third joint nearly square, slightly notched at the extremity and within: claws (*chelæ*) great and strong; *feet* of the second and third pair terminated by a simple joint, and larger than those of the fourth and fifth pair, which are elevated on the back and provided with a claw, inasmuch as the last joint, which is bent and pointed, is opposed to a spine nearly of the same form, which terminates the penultimate joint: *carapace* oval, rounded, very convex, cut (*découpée*) on its anterior borders, hairy or rough (*hérissée*) as well as the feet and chelæ: *eyes* small, supported on short peduncles, rather approximated, and lodged in orbital or cylindrical fossæ. (Desmarest.)

Geographical Distribution.—Probably extensive in the seas of warm climates. The Mediterranean, the Cape of Good Hope, and the Antilles, are given as localities.

Habits, &c.—The *Dromiæ* are indolent in their motions, and live in spots where the sea is moderately deep, choosing for their habitation places where the rocks are not hidden under the sand. They are almost always found covered with a species of *Alcyonium* or with valves of conchifers, which they retain with their four hinder feet, and which seems to serve them as a shield against their enemies. The *Alcyonia*, which are in general of the species named *Alcyonium Domuncula*, continue even to develop and extend themselves upon their carapace, which they at last entirely conceal. In the month of July, according to M. Risso, the females come out of the state of torpor (*engourdissement*) in which they ordinarily are, and betake themselves to the shallows for the purpose of depositing there a great number of eggs. (Desmarest.)

Place in the series.—*Dynomene*, according to Desmarest, should be placed next to *Dromia*, the former differing from the latter principally in having the feet of the fifth pair only instead of the four last, elevated on the back. In general the *Dromiæ* bear a great resemblance to the *Crabs*, properly so called, in the general form of the body, the structure of the parts of the mouth, the position of the antennæ, &c.; but they differ from them in the elevated situation of their four posterior feet and in their manners.

Example, *Dromia hirsutissima*. Carapace very convex, with six dentations on its lateral borders, and with a large sinus on each side of the front, which is nearly trilobated. Body covered with long red hairs. Locality, Cape of Good Hope.

Dromia hirsutissima.

DROMORE, a bishop's see in the ecclesiastical province of Armagh in Ireland. The chapter, which is regulated by patent of James I., consists of dean, precentor, chancellor, treasurer, archdeacon, and one prebendary. This diocese occupies the western portion of the county of Down, and extends partially into Armagh and Antrim. The greatest length from north to south is 35½ English miles; and the greatest breadth, from east to west, 21½ miles. It contains 26 parishes, constituting 25 benefices. In 1792 there were 27 churches of the establishment in this diocese: in 1834 the numbers were, churches of the establishment 27; Roman Catholic churches, 34; Presbyterian churches, 45; other houses of Protestant worship, 24. In the same year the gross population of this diocese was 183,209, of whom there were 41,737 members of the Established Church; 76,275 Roman Catholics, 69,264 Presbyterians, and 933 other Protestant dissenters. There were at the same time in this diocese 233 schools, educating 16,987 young persons, being in the proportion of 9½ per cent. of the entire population under daily instruction, in which respect Dromore stands twelfth among the 32 dioceses of Ireland. Of the above schools 23 were in 1834 in connection with the National Board of Education.

The foundation of this see is attributed to St. Colman in the 6th century. Its early history is obscure, and there is no regular succession of bishops on record till after the 12th century. Dr. Jeremy Taylor, who had the administration of this diocese granted him in addition to that of Down and Connor by King Charles II. in 1661, and Dr. Percy, the learned collector of ancient English ballad poetry, have been the most distinguished bishops of Dromore. The bishop's house, which is a plain mansion, was built by Doctor Beresford in 1792. Before his time the episcopal residence had been at Magheralin. By act 3rd and 4th Wm. IV. c. 37, this bishopric when void becomes incorporated with the united diocese of Down and Connor, and its revenues vest in the board of Ecclesiastical Commissioners.

DROMORE, a pretty well built town and thriving linen market, in the barony of Lower Iveagh and County of Down, is situated on the Lagan, 66 Irish or 84 English miles from Dublin on the great northern road to Belfast. The cathedral is a mean structure on the bank of the river. East of Dromore stands a remarkable mound, 60 feet high, with three concentric entrenchments, and an extensive outwork towards the Lagan. The population of Dromore in 1831 was 1942. (Beaufort's *Memoir of a Map of Ireland*; Harris's *Ware's Works*; *Reports, &c.*) [Down.]

DRONE. [BEE.]

DRONTE. [DODO.]

DRONTHEIM. [TRONDHEJEM.]

DROPSY, HYDROPS, a preternatural collection of watery fluid in different parts of the body. In the state of health, there is constantly poured out upon every surface, cavity, and interstice of the body, a watery fluid derived from the blood and deposited by the capillary blood-vessels. [CAPILLARIES.] This fluid does not remain long where it is deposited, but by vessels appropriated to the office, termed absorbents, is soon taken up and reconveyed into the common circulating mass. As long as there is a perfect balance of action between these two sets of vessels, which is always the case in health, there is no accumulation of fluid, the exhalation and the absorption being always exactly equal. But if from any cause that balance be disturbed; if either the capillary blood-vessels pour out an unusual quantity of fluid, or if the absorbents fail to act with their accustomed energy, an accumulation of fluid must necessarily take place, and this accumulation, when it amounts to an appreciable quantity, constitutes the disease called dropsy. It follows that dropsy must always be the consequence either of increased exhalation or of diminished absorption.

The causes which lead to increased effusion are exceedingly various; but they are all resolvable either into those which produce a morbid condition of the blood-vessels, an obstruction to the free circulation of the blood, or a morbid condition of the blood itself. The morbid condition of the blood-vessels may be of two opposite kinds, either that of preternatural strength, in consequence of which their action may be so excited as to pour out an unusual quantity of fluid; or that of extreme debility, in consequence of which they may be unable to prevent a preternatural exudation of the thinner parts of the blood through their relaxed coats. These different states of the blood-vessels depend on two diametrically opposite conditions of the system, and accord-

ingly the different species of dropsy are very generally divided into active or passive, acute or chronic, sthenic or asthenic.

Whenever an obstacle is opposed to the free return of the blood from the capillary arteries into the capillary veins, the blood accumulates in the capillary arteries, which are the exhalant vessels. By this accumulation of blood in the exhalants, either their action is increased, the consequence of which is increased exhalation; or their action is diminished and their tone destroyed, the consequence of which is equally increased exhalation. Various morbid conditions of many organs oppose a free return of the circulating blood from the capillary arteries into the capillary veins: any disease of the right side of the heart, for example, which prevents its receiving from the great venous trunks of the body the quantity of blood in a given time, which is necessary to maintain the balance of the circulation; any disease of the lungs, which prevents the lungs from receiving from the right ventricle of the heart the full quantity of blood which the heart has received from the great venous trunks; any disease of the liver, which prevents the liver from receiving by the great vein which ramifies through it the vena portæ, the full quantity of blood which it ought to receive from the different abdominal viscera; any disease of the great blood-vessels themselves, by which the current of the circulating blood is prevented from passing freely through them. Such a disease of the heart may be occasioned by an ossification of its valves; of the lungs, by an obliteration or compression of its air vesicles, upon the walls of which the capillary terminations of the pulmonary artery are distributed; of the liver, by an induration of its substance and a consequent mechanical compression of the minute branches of the vena portæ; of the great blood-vessels, by diseases of their coats giving rise to the tumours called aneurisms, or by the compression of tumours existing in neighbouring parts, scirrhus, fatty, or watery tumours, which may have their seat in any organ, or by the compression of the great venous trunks of the system by the bulk of the distended uterus in pregnant women.

When dropsy is the result of an increased action of the capillary blood-vessels, it is considered a primary or idiopathic disease, and constitutes the sthenic, tonic, active, or acute dropsy of authors. In this case the capillaries are conceived to be in that state, whatever it may be, which constitutes acute inflammation. The increased effusion, which constitutes the dropsy, is the result of that increased action, and by the effusion the inflamed state of the vessels is often removed.

This form of dropsy occurs most frequently in the young, the plethoric, and the robust. It is induced by all the causes of inflammation, such as cold, suddenly checked perspiration, suppression of any of the natural secretions and discharges, a plethoric condition of the system, a repulsion of acute diseases of the skin, &c. It has its seat most frequently in the serous membranes of the great cavities of the body, the walls of which are lined by those membranes, as those of the chest and abdomen, or of the viscera to which these membranes afford an external covering, as the brain, the lungs, the heart, the liver, and all the abdominal and pelvic viscera.

This form of dropsy is attended with a greater or less degree of fever, the invariable concomitant of acute inflammation. The febrile symptoms are general uneasiness, more or less restlessness, pains in the back and limbs, heat of skin, preceded by chilliness, headache, suppression of the secretions and excretions, and consequently a dry or clammy state of the mouth, a constipated state of the bowels, and a loss of appetite. The pulse is always excited, and is usually full and hard, or small and sharp. There is commonly some degree of pain in the organ in which the inflammation has its principal seat. When the inflammation and febrile symptoms are intense, the pain is usually acute and its seat clearly defined; but when the inflammation and febrile symptoms are not very intense, the pain may be slight and its seat correspondingly obscure; but some degree of pain or uneasiness may generally be found if carefully sought for, and at all events the true seat of the inflammation may be usually detected by the disordered function of the affected organ.

When this condition of the system exists with a certain degree of intensity it constitutes the most acute form of dropsy; but when it exists with less intensity it gives rise to another form of the disease, termed sub-acute dropsy, in

which the symptoms are the same but less urgent. In this case there is often little or no local pain; the febrile symptoms are milder, the general uneasiness is less prominent, the skin less hot; there may be little or no thirst, and the pulse much less hard and sharp. This form of the disease is equally dangerous in itself, and often more fatal, in consequence of its true nature being overlooked, until it has made such progress that its course is no longer to be checked. It is often the consequence of more acute diseases, and frequently follows scarlet fever, measles, bronchitis, inflammation of the pleura, inflammation of the liver, influenza, &c. The original and urgent disease may subside, and then comes on slowly and almost imperceptibly this insidious and fatal malady.

The third form of dropsy is that termed asthenic, or passive. It is so generally the consequence of some other morbid condition of the system that it is not usually considered a primary or idiopathic disease, but merely a sequent or ultimate result of some other pathological state. Its proximate cause is conceived to consist partly of a laxity of the tissues of the exhalant vessels, in consequence of which they are incapable of retaining the fluid part of the blood; and partly of an altered condition of the blood itself, in which its solid portions, namely, its albumen, fibrin, and red particles [Blood] are preternaturally diminished and its serum proportionally increased. The state of the system in which this form of dropsy usually comes on, and the causes which most frequently and obviously induce it, are supposed to conduce equally to this morbid state of the containing vessels and the contained blood. The state of the system in which it comes on is that of extreme debility, however induced; but its ordinary exciting causes have so obvious and great a tendency to exhaust the vital power, that they are usually denominated debilitating causes; such are fever, whether intermittent or continued, exanthematous or typhus, long continued and excessive evacuations, whether of natural discharges, or of preternatural effusions of blood, deficient or unwholesome diet, diseases of the digestive organs, by which the due assimilation of the food is prevented, intemperance in the use of intoxicating liquors, whence drunkards of all kinds, and especially dram-drinkers, so commonly, nay, almost invariably, die of dropsy.

The acute and inflammatory forms of dropsy ordinarily produce increased exhalation only into particular parts of the body; but this state of general debility may give rise to an increased exhalation into every cavity and interstice, and thus bring on a general dropsy. Thus it is by no means uncommon to have at one and the same time effusions into the cavity of the cranium, into that of the thorax, into that of the abdomen, and likewise into the cellular tissue almost over the whole body. In such cases the operation of a general cause is rendered manifest by these several dropsies increasing in one part as they diminish in another, and this alternately in the different parts. This combination of the different species of dropsy, or rather, as it may be justly termed, this universal dropsy, must, it is argued, be referred to a general cause, and in most instances, hardly any other can be thought of but a general laxity of the exhalants. It is this which constitutes what is called the hydropic diathesis, which frequently occurs by itself, and frequently concurring with other causes, is especially that which gives them their full effect. This state of the system, when it first comes on, gives rise to a disordered, enfeebled, and wasted appearance of the body, which is commonly called a breaking up of the constitution, and is technically termed a cachexy; in a very short space of time it is usually followed by general dropsy.

All the acute inflammatory and febrile symptoms so characteristic of the other forms of dropsy are of course absent in this. The skin, instead of being hot, is often unusually cold; the pulse, instead of being full and hard, is weak, small, unequal, and rapid; the contraction of the heart is so feeble that slight causes often completely arrest its action, and render it incapable of carrying on the circulation, whence the patient drops down dead instantaneously, perhaps on endeavouring to walk down stairs, or to move from one chair to another; the muscles in general are flaccid, all the movements are weak, irregular, and uncertain, and all the actions of the system exceedingly feeble.

It is more especially this last form of dropsy which is induced by a morbid change in the constitution of the blood, namely, an increase in the proportion of its serum. An

unusual quantity of water taken into the body, and not carried off by the excretory organs, may possibly give rise to such a condition of the blood, and accordingly it is said that suddenly drinking large draughts of very cold water has been immediately followed by dropsy, probably from the cold producing a constriction of the excretories; in consequence of which they are unable to carry off the water as it flows into the mass of blood and thus to maintain its proper constitution. A preternatural abundance of the more fluid parts of the blood may also accumulate in the circulating mass by a suppression or diminution of the ordinary aqueous excretions. Hence the influence of a cold and moist atmosphere in inducing dropsy; and the highly important influence of diseases of the kidneys in producing the disease. It is found that there are several different diseases of the kidneys of which dropsy is the ordinary result. It is the office of the kidney to remove from the blood a large proportion of its fluid parts; it is an excreting and depurating organ of the greatest importance. Any disorder of it which interferes with the performance of its function may therefore occasion an accumulation of the watery particles of the blood, and thus give rise to dropsy; and it is actually found that when the secretion of the urine is suppressed, the watery portion of the blood is often poured into some of the internal cavities. Moreover, large abstractions of blood are frequently followed by dropsy, because the albumen, the fibrin, and the red particles which constitute the solid parts of the blood are not so easily renewed as the serum, and the superabundant serum readily passes off by the exhalants preternaturally relaxed by the debilitated state of the system induced by the bleeding.

The parts of the body in which the dropsical effusions usually collect are the cavities of the cranium, chest and abdomen, and the interstices of the cellular tissue diffused over the whole body, and forming a constituent element of every organ.

The dropsical fluid itself consists for the most part of the serum of the blood; but its sensible properties and its chemical constitution vary exceedingly according to the form of the disease and the condition of the capillary vessels at the moment the effusion takes place. If the vascular action have been great, the fluid is yellow or straw coloured like whey, and is more or less turbid, and contains minute particles of albumen and fibrin. If, instead of excited vascular action, the effusion have been the consequence of an altered condition of the blood, the fluid is dark-coloured and turbid, probably from the admixture of the red particles of the blood. If the effusion have taken place very slowly in consequence of the operation of some cause progressively but not rapidly impeding the circulation more and more, the fluid is almost colourless and nearly destitute of animal matter. If the fluid have been long retained in the cavity containing it, it may be of all colours and consistence, and its sensible properties may be infinitely diversified, and these diversities are apparently increased by the admission of the external air to the cavity in consequence of the artificial removal of the fluid by the operation called tapping.

But another general cause of dropsy has been stated to be, interruption or diminution of the absorption which should take up the exhaled fluids from the several cavities and interstices of the body. It is obvious that absorption may be diminished, or may cease altogether, from a loss of tone in the proper absorbent vessels. Without doubt, a certain degree of tone or power is necessary in the absorbent extremities to enable them to perform their office; and it was justly observed by Cullen, that the same general debility which produces that laxity of the exhalant vessels which constitutes the hydropic diathesis, occasions at the same time a loss of tone in the absorbents; that therefore a laxity of the exhalants generally accompanies a loss of tone in the absorbents; that consequently a diminution of absorption must have a considerable share in the production of dropsy; and that this is rendered the more probable since dropsies are often cured by medicines which seem to operate by exciting the action of the absorbents.

There are many diseases of which dropsy is the sequent, and the dropsy induced in this indirect mode is called secondary, consecutive, symptomatic, or passive, in contradistinction to its primary acute and active forms. The diseases which precede dropsy as their ordinary consequent have their principal seat in the heart, and its great vessels, in the lungs, the liver, the spleen, the kidneys, the uterus,

and the ovaria. When dropsy is the consequence of disease of the heart, the signs of disease of the heart commonly long precede the appearance of the dropsy. The diseases of the heart which most commonly give rise to dropsy are passive dilatation of its muscular parietes and ossification of its valves, the existence of which may be ascertained with tolerable certainty both by certain signs which are pathognomonic of these organic changes, and by auscultation. When dropsy is the consequence of disease of the heart, the effusion is commonly indicated first by swelling of the face, especially beneath the eyelids, and next by swelling of the feet and ankles, and of the hands and arms, particularly of the left. As in the progress of the disease the effusion collects and accumulates in the cavity of the thorax, or in that of the pericardium, it is denoted by a peculiar train of symptoms hereafter to be described. [HYDROTHORAX and HYDROPS PERICARDII.] The respiration is always more or less embarrassed; the horizontal position uneasy, and often impossible; the pulse, which is seldom or never natural, is very variously affected. Whenever there is a watery swelling of the face, hands, arms, or ankles, with an impaired state of the constitution, the consequence of protracted ill health, and without manifest disease of the lungs, it may be certainly inferred that there is a disease of the heart. The dropsy which results from disease of the heart is very often completely removed by appropriate remedies. The effusion often recurs indeed, and is again removed, and this successive recurrence and removal of the affection takes place indefinitely until the cardiac disease, on which the effusion depends, reaches a point which is no longer compatible with life.

Diseases of the coats of the great blood-vessels constituting aneurism, concretions within their cavities, or tumors of neighbouring parts, pressing upon their trunks, and obstructing the passage of the blood through their canal, are frequent causes of consecutive dropsy. Inflammation of the pleura lining the cavities of the chest, inflammation and congestion of the lungs, the consolidation or hepatization of the substance of the lungs, and the obliteration of the air-vesicles by the deposition of tuberculous matter, may give rise to effusion either into the cavity of the chest, or into the cellular tissue forming the parenchyma of the lungs, or into the cellular tissue diffused over the whole body.

Inflammation of the liver, generally of a slow or chronic nature, leading to a deposition of adventitious matter in its substance, and the consequent enlargement of the organ and the consolidation of its tissue, is a common cause of dropsy, occasioned by the obstruction to the circulation through the vena portæ, the effusion being in this case often confined to the cavity of the abdomen.

The spleen, which consists of a congeries of blood-vessels, and which is very apt to be enlarged and obstructed, may occasion effusion into the abdomen in the same manner as disease of the liver.

The kidneys are subject both to functional and organic diseases, which are followed by effusions into all the cavities, in consequence of the failure of these organs to remove from the common mass of blood the superfluous and noxious principles which it is their office to eliminate.

Dropsical effusions are often poured into the uterus and ovaria, in consequence of primary disease in these organs; at other times tumors are formed within or attached to them, which press upon and compress the trunks of neighbouring blood-vessels, and thus occasion dropsy by a mechanical obstruction to the circulation of the blood.

It is an interesting and important fact, that while in this disease the thinner parts of the blood are thus poured out into the several cavities and interstices of the body, the kidneys often remove to a very large extent the more solid portions of the blood, more especially the albumen, and sometimes even the red particles. Hence there are several forms of dropsy in which the urine is loaded with a preternatural quantity of albumen, the presence of which may be detected by the application of heat, nitric or muriatic acids, alcohol, or corrosive sublimate, to the urine, all of which coagulate the albumen and thus render it visible. But albumen is not always contained in the urine of dropsical patients. It is of some importance in practice to discriminate the cases with albuminous urine from those without it, since there are remedies of great efficacy in the latter form of the disease, which are useless, if not injurious, in the former. This fact

would indicate that dropsy with albuminous urine has its seat in a particular set of organs, and is dependent on a peculiar morbid action of those organs; and although very much still remains to be ascertained in relation to these points, yet some progress has been made at least towards determining the seat of the malady, if not the nature of the affection when the urine is albuminous. The condition of the urine in this respect ought therefore always to be examined, because it may throw some light however small on the constitutional and local disorder, and may be some guide to the judgment in the selection of remedies.

Dropsy is always a formidable and often a highly dangerous disease. Its acute forms, though attended with the most urgent symptoms, are in general less unfavourable than most of its chronic forms, because in the former, though the disordered actions may be very intense and dangerous, yet they are more under the controul of remedial agents, and they often do not depend on any irreparable vice of the constitution, whereas the latter are the sign and the result of deep-seated and surely advancing disease. Of course the prognosis in any particular case must entirely depend on the seat and nature of the disease of which it is the sequent.

There is no disease which requires a more varied treatment than dropsy, because, like fever, dropsy may exist in, and be essentially connected with, diametrically opposite morbid conditions of the system. Dropsy may depend on a state of the system, for the removal of which all other remedies will be tried in vain unless their application be preceded by a decided abstraction of blood: dropsy may depend on a state of the system in which the abstraction of the smallest quantity of blood may prove almost instantaneously fatal: in the former case stimulants and excitants invariably increase the intensity of the disease; in the latter they are indispensable to the preservation of life. On the clear discrimination of these two different states of the system, and the two different classes of disease to which they give rise, and on the sagacious detection of the different shades by which they may appear to be blended with and lost in each other, the successful treatment of dropsy mainly depends.

In the acute form of dropsy dependent on active inflammation, blood-letting is necessary, just as it is in ordinary inflammation, the quantity of blood which it is proper to abstract depending, of course, on the organ inflamed, on the intensity of the inflammation, and on the strength of the constitution. One full bleeding will commonly suffice; but there are many cases in which its repetition is indispensable. In the great majority of cases, however, after a full bleeding from the arm, the local will be preferable to a repetition of the general bleeding.

The next indication after blood-letting is to equalize the circulation and to promote the secretions. This is most effectually accomplished by bringing the system under the influence of mercury, by calomel combined with James's Powder or with opium, and this treatment may be conjoined with diuretics, of which digitalis is the best.

In the subacute form the same general plan of treatment is necessary, but it can by no means be carried to the same extent, and in each individual case the application of the remedies employed must of course be modified according to the circumstances peculiar to that case.

In the chronic, passive, or asthenic form, life would be destroyed by the employment of the remedies which alone are efficacious in the acute form. In this debilitated state of the system the abstraction of the smallest quantity of blood is highly pernicious. The safer and the most efficient remedies in this form of the disease are tonics, the laxatives called deobstruents, taraxacum, mild unirritating doses of mercury, and iodine, particularly in the form of the hydriodate of potass.

The only effectual treatment of consecutive dropsy is that which is proper to the removal of the primary disease. But the detection of the true seat and nature of those organic diseases which are antecedent to dropsy is often a matter of extreme difficulty, requiring patient and acute investigation, and an extensive and precise acquaintance with pathology. And the treatment of the disease when ascertained, the selection of the appropriate remedies, and the employment of these with due, and only with due, activity and vigour, is a delicate and difficult task, sometimes rewarded, when performed with sagacity and skill, with a degree of success not to have been anticipated. It is pre-eminently in cases like these that the scientific and discerning phy-

sician saves, when the ignorant, careless, and routine practitioner destroys. [HYDROCEPHALUS, HYDROPS PERICARDII, HYDROTHORAX, &c.]

DROPWORT, a poisonous wild umbelliferous plant, with fleshy-fingered roots, inhabiting ditches and wet places. It has been sometimes sold fraudulently by itinerant gardeners as a new species of dahlia. Its botanical name is *Ceanothus crocata*.

DROSERA/CEÆ, a natural order of albuminous exogenous plants, consisting of marsh herbs, whose leaves are usually covered with glands or glandular hairs, and whose flowers are arranged in circinate racemes. The calyx consists of five sepals: there are five petals, five or ten hypogynous stamens, a one-celled many-seeded capsular fruit, and minute seeds, having an embryo lying at the base of a large quantity of albumen. There are many species of the genus *drosera*, called in English sundews, more remarkable for the singular structure of their glandular hairiness than for the beauty of their flowers, and of no known use. A few other little-known genera are associated with it; and it is probable that *dionæa* [*DIONÆA*], whose singular irritable leaves have much analogy with those of *drosera*, also forms a part of the order, notwithstanding its indehiscent fruit and erect veneration.

De Candolle having inexactly described the embryo as lying in the axis of the albumen, the true affinities of the order were overlooked; they have lately however been more correctly determined to be with *Cephalotaceæ* and *Francoaceæ* rather than with *Violaceæ*, *Polygalaceæ*, or *Frankeniaceæ*.

A plant of *Drosera rotundifolia*. 1, a complete flower magnified; 2, a ripe capsule magnified—the seeds are seen between the valves of the capsule; 3, a seed very much magnified—the dark space in the middle is the nucleus, the remainder is a loose integument that invests the seed; 4, a section of the nucleus still more magnified—here the minute dicotyledonous embryo is seen at the base of the albumen.

DROWNING, the state of asphyxia [*ASPHYXIA*] produced by the immersion of the body under water. When a warm-blooded animal is immersed under water, and forcibly retained there, he immediately begins to struggle violently, and uses every effort to rise to the surface. These struggles are not at first the result of pain, but of fear. It is proved by direct experiment that the obstruction to the respiration which produces pain does not come on for some time. The point of time when the painful impediment to respiration occurs is well ascertained. For the reason assigned in the article *ASPHYXIA*, in the space of three quarters of a minute a violent effort is made to inspire, to expand the lungs with air, but no air can enter. Every

effort to inspire is followed by a corresponding effort to expire. At each expiration a small quantity of air is expelled from the lungs, and is seen under the surface of the water in the form of bubbles; for although the water excludes the air from entering the lungs, notwithstanding the most violent efforts to inspire, yet it cannot prevent some portion of air from being expelled from the lungs by the violent efforts to expire. The ultimate result of these repeated and violent expirations is greatly to diminish the bulk of the lungs, and to bring them to the utmost degree of collapse to which it is possible to reduce them by any voluntary or instinctive efforts which the animal is capable of making.

When a human being is drowned by accident, if the fall has been from a considerable height and the water is not of very great depth, the body is precipitated to the bottom of the water; it then quickly rises to the surface, partly because the specific gravity of the body, when the lungs are full of air, is less than that of water, and partly because the body is rendered still lighter by the air, always amounting to a considerable quantity, which is collected and retained in the clothes. If the person be not able to swim, he generally struggles violently, and probably screams; by these efforts the lungs are partly emptied of the air they contained, the comparative weight of the body is increased, and consequently it again sinks to the bottom, but it soon again rises, and this alternate rising and sinking may occur several times in succession. Whenever the body comes to the surface and the mouth is above water, the painful impediment to respiration produces an instinctive effort to inspire, and a hurried gasp is made to obtain air. But often the mouth is not sufficiently above the surface of the water to obtain air without respiring a quantity of water along with it; but the quantity of water received in this manner is never great, probably not more than is expelled by the cough excited by the irritation of the glottis in consequence of the contact of the water and by the subsequent expiration. Every instant the body remains in the water, for the reasons immediately to be assigned, the powers of sensation and of voluntary motion rapidly diminish, and at length, perfectly insensible and motionless, it remains at the bottom of the water, where, if wholly undisturbed, it continues until the disengagement of various gases in the progress of putrefaction renders it again specifically lighter than water, and brings it once more to the surface.

The change in the system produced by continued submersion, the consequent suspension of respiration, and the necessary extinction of life, are all referrible to one pathological condition, namely, a change in the nature of the blood. The water prevents any portion of air from entering by the trachea to the air vesicles of the lungs; consequently no air comes in contact with the venous blood contained in the capillary branches of the pulmonary artery which are spread out upon the walls of these air vesicles; the venous blood which flows to the lungs is therefore incapable of being converted into arterial blood, whence the lungs can deliver to the left side of the heart only venous blood to be sent out to the system. As the circulation goes on, all the arterial blood in the body is at length converted into venous, and flows into the great venous trunks of the system, by which it is returned to the right side of the heart, and thence to the lungs, where it undergoes no change, but remains venous. These currents of venous blood, and of venous blood only, are successively sent out to the system. But venous blood is incapable of maintaining the action and vitality of the brain and spinal cord of the heart, of the voluntary muscles, or of any organ of the body, and consequently, when nothing but venous blood circulates in the system, the death of all the organs is the sure and quick result, and the organs die in the order and mode already described. [ASPHYXIA.]

Taking the average of a great number of experiments, it is found that when an animal is forcibly and continuously held under water, the blood in the arteries loses its vermilion colour, and begins to grow venous in the space of three quarters of a minute. In one minute and a quarter it is obviously dark. In one minute and a half, no difference can be distinguished between the blood in the arteries and the blood in the veins; consequently, in an animal that is submersed and that never rises to the surface, the system is brought completely under the influence of venous blood in the space of one minute and a half, and though the body should remain under water half an hour, the blood does

not become sensibly darker, because it can only be completely venous.

Circumstances may make a few seconds difference in regard to the point of time when these phenomena take place. If for example an animal be submersed at the instant of expiration, the colour of the blood is lost somewhat sooner than when it is submersed at the instant of inspiration, and if the animal be much alarmed and struggle violently, the change takes place with greater rapidity; but the difference from any cause of this kind never amounts to more than a few seconds. Age however is capable of effecting a more remarkable difference. It is proved by numerous and accurate experiments that the younger the animal the longer it can live when deprived of air by submersion. If, as is commonly the case, an adult warm-blooded animal be irrecoverably dead in the space of four minutes after complete and continuous submersion, an animal of the same species only a few days old will live twelve minutes. A pup will live considerably longer than a young dog, a young longer than a middle aged dog, and a middle aged longer than an old dog.

Sensibility and the power of voluntary motion are diminished the moment the arterial blood begins to lose its vermilion colour; an animal is completely insensible, and has wholly lost all power of voluntary motion, that is, it is in a state of apparent death, as soon as the arterial blood is completely venous. In one minute and a half, then, after complete and continuous submersion, animal life is completely extinguished. But by the prompt and vigorous use of the appropriate remedies, recovery from this state is possible; because the organic functions go on for a considerable period after apparent death, and death is not real until the organic functions have wholly ceased. Nevertheless, though the organic functions may continue for an indefinite period after the animal functions are extinguished, from ten minutes to half an hour, or more, yet, in no instance in which the experiment has been fairly tried has any adult warm-blood animal that has been completely and continuously submersed for the space of four minutes been capable of resuscitation, though all the means of restoring animation may have been instantaneously and most actively and judiciously employed. Accordingly it is found in practice that the immediate and vigorous use of the best means for restoring animation often fail when the person has not been in the water more than four minutes. In general, however, if the body has not been in the water longer than from five to eight minutes, the prompt and persevering use of the proper means for restoring animation will succeed; no doubt, because in some one of or in all the times that the body has come to the surface air has been obtained and conveyed to the lungs in the hurried gasp instinctively made at these moments. Still it is exceedingly rare that persons are recovered who have been in the water fifteen minutes; occasionally however animation is restored after a submersion of twenty minutes, or even half an hour; and apparently authenticated cases are on record in which resuscitation was accomplished after the body had been in the water for three-fourths of an hour. In these cases, circumstances must have favoured the occasional inspiration of air; it is utterly impossible that life can have been maintained so long unless the individual had breathed at intervals during the time; and as none can tell what circumstances may have occurred favourable to the inspiration of air, it is an imperative duty in all cases to resort to the proper means for restoring animation with all the promptitude and energy possible.

When a person who has been drowned, who was previously in a state of sound health, is taken out of the water, the appearances presented by the body are the following:—

The whole of the external surface is cold; the colour of the skin is pallid, excepting in the parts where it is livid rather than pallid, as in the face, which is always either entirely pale or slightly livid. The eyes are half open, and the pupils much dilated. The mouth and the nostrils contain a great deal of frothy fluid. A large quantity of the same kind of fluid is contained in the trachea, the bronchial tubes, and the air vesicles of the lungs. The tongue is protruded between the teeth, and approaches to the under edge of the lips. The whole head is sometimes much swollen, and the features occasionally present the appearance of those of a person who has died from apoplexy; and this is said to be particularly the case with those who have fallen

into the water in a state of intoxication. It is usually considered as a sign that a person has been drowned while living, and that the body has not been thrown into the water after death, that the ends of the fingers are excoriated, and that there is a collection of dirt or sand under the nails, appearances resulting from the efforts which the drowning person has made to avert his impending fate; but if the water be deep, no appearance of this kind is present, because the power of struggling is over before the body touches the ground, and a person in the state of intoxication, who falls into deep water, may expire without the power to make a single effort to save himself.

With regard to the internal organs, the heart and its great blood-vessels are always found preternaturally loaded with dark-coloured blood, sometimes to such an extent that the heart seems completely to fill the bag of the pericardium. This accumulation of black blood is always on the right side of the heart, which usually contains somewhat more than double the quantity contained in the left cavities.

The lungs are invariably very much reduced in volume, and are exceedingly loaded with black blood. Both the pulmonary arteries and veins are likewise distended with black blood.

The substance of the brain is of a darker colour than natural, and its vessels are commonly turgid with black blood; but sometimes the turgescence of the cerebral blood-vessels is not in proportion to the accumulation of blood in the other organs.

There is always a quantity of water mixed with frothy matter in the trachea and bronchi. Occasionally this frothy matter is mixed with blood. The quantity varies a good deal in different cases, but it is never very great. At one time it was thought to be so great as to be the cause of death in drowning. It was conceived that the water flows into the lungs by the trachea in such abundance as to occasion asphyxia. The controversy which was long agitated on this point is now set at rest by numerous and accurate experiments, which demonstrate that only a very inconsiderable quantity of water enters the trachea, and never sufficient to occasion death.

A similar controversy prevailed on the question whether water enters the stomach, which is now equally decided in the negative. It is proved beyond all doubt that no water passes into the stomach, or at least that no quantity enters it capable of contributing in the slightest degree to the fatal event. The establishment of this point is important, because the contrary notion had led to the adoption of most pernicious practices. With a view of evacuating the water supposed to be accumulated in the lungs and stomach, the bodies of the drowned, when taken out of the water, were held up by the heels, rolled on barrels, and subjected to other practices calculated rapidly to extinguish any remaining spark of life; and though the notion which led to these absurd practices is exploded, the practices themselves continue. In a paper published in the 'Medical Repository' for July, 1824, Mr. D. Johnson, surgeon, Farrington, in detailing a case of suspended animation in a seaman who had fallen from a yard-arm into the sea when the ship was going at the rate of nine knots and a half per hour, and was afterwards picked up in an insensible state, says, 'When brought on board the ship he showed no signs of life. I had him immediately suspended with his head downwards, and well shaken for a minute or two. He was then laid on the cabin-table, and rubbed all over by two or three men with flannels, &c. Tartarized antimony was rubbed into the roof of the tongue, and tobacco-smoke blown into the mouth and nostrils.' Short of decapitation no experiments could be devised better calculated to destroy the smallest chance of resuscitation.

The proper remedies for the recovery of the drowned are few and simple. The body, placed on a bed-chair, should be removed to the receiving house or any place where the conveniences required may be most easily obtained. The wet clothes should be stripped off as rapidly as possible, the body well dried and surrounded by warm air, if it can be readily procured, by the portable warm air bath, of which there ought to be one at every receiving house. At first the heated air should only be a few degrees above the temperature of the body, and the heat, which ought always to be ascertained by a thermometer, should be subsequently increased with caution. The body being thus surrounded with warm air, artificial respiration should be performed without

the delay of a moment, and this should be assisted by electricity applied at first in the form of very gentle shocks.

By the application of heat the capillary blood-vessels are stimulated to action, the determination of blood towards the external surface of the body is favoured, and the internal organs are thus relieved of their oppressive load. By artificial respiration the cavity of the chest is enlarged, the collapsed state of the lungs is removed, and atmospheric air, the great agent needed for the decarbonization of the blood, and on the want of which all the dangerous phenomena of drowning depend, is transmitted to the lungs and brought into contact with the venalized blood. By electricity the organs which carry on the mechanical part of respiration, that is, those which alternately enlarge and diminish the capacity of the thorax are roused and excited to resume their natural action. There are some few other useful auxiliaries, but so important and efficacious are these three powerful agents, when judiciously and perseveringly employed, that they may be considered as the only remedies worth regarding. But unfortunately they are as potent for evil as for good. A slight mismanagement of any of them may utterly destroy that life which the delicate and skilful use of it would have reanimated. It is impossible in this place to enter into a detail of the dangers with which the incautious employment of these powerful remedies is fraught, or minutely to detail the mode in which they ought to be applied in practice. It is a subject which deserves much greater attention than it has hitherto received. The apparatus for heating the bodies of the drowned, for the artificial inflation of the lungs, and for the application of electricity, are susceptible of vast improvement both with reference to the efficacy and the safety of these remedies; and there are few subjects to which mechanical genius and scientific knowledge could be applied with greater prospect of conferring signal service on mankind.

DRUIDICAL BUILDINGS. [AVERBURY; CARNAC; STONEHENGE.]

DRUIDS. [BRITANNIA.]

DRUM, a pulsatile musical instrument, of which there are three kinds,—the *Side Drum*; the *Base or Turkish Drum*; and the *Double Drum*. The first is a cylinder, formerly of wood, but now invariably of brass, on each end of which is a hoop covered with vellum or parchment. This is the ordinary regimental drum. The second is formed as the first, but of oak, on a much larger scale, and used, not in conjunction with the fife, but as part of the regimental band. It is likewise employed occasionally in the orchestra. The third is made of copper, nearly hemispherical, covered with a strong head of calf's-skin, and stands on three iron legs. The Double Drums vary in dimensions, from nineteen inches to three feet in diameter. They are always in pairs, and are tuned, by means of many screws which tighten the head, to the key-note and the fourth below. Very recently, however, a most decided improvement has been effected in the manner of tuning these instruments. By means of a lever operating on several hooks which act simultaneously on the head, or hoop on which the skin is strained, the tuning is performed at once, and with such rapidity, that, in our presence, the melody of 'God save the King' was performed on a single drum in a time not much slower than that usually adopted. A patent has been obtained by the ingenious mechanist (Mr. Cornelius Ward) to whom we are indebted for this useful invention; and it is to be presumed that in future all double drums will be constructed on his principle.

DRUM. [Down.]

DRUMMOND, WILLIAM, the son of Sir William Drummond of Hawthornden, was born December 13, 1585. He was educated at Edinburgh, and studied civil law in France. On his father's death, in 1610, he relinquished his profession and devoted himself to literary pursuits at his paternal mansion of Hawthornden. He did not, however, experience that freedom from trials which he had probably anticipated in his retirement. His betrothed bride died on the eve of their marriage; and in order to divert his thoughts from brooding over this deep and bitter affliction, he undertook a tour which lasted eight years, during which time he visited Germany, France, and Italy, and collected a library of great value, of which part is now in the possession of the university of Edinburgh. In his 46th year he married a lady whose fancied likeness to the former object of his affections is said to have constituted her chief attraction for him. When the civil war broke out, his

political bias exposed him to grievous annoyances, particularly that of being compelled to supply his quota of men to serve against the king. This, and regret for Charles's death, shortened and embittered his days, and he died at Hawthornden, December 4, 1649.

Southey has observed that he was the first Scotch poet who wrote well in English. A comparison of his works with those of his predecessors, Douglas and Dunbar, will show the progress made during the sixteenth century towards fixing and perfecting the language, as well in Scotland as in England. His sonnets, and indeed nearly all his poems, mark strongly that indulgence in sorrow which causes it to take the form of habit, and as such conveys a feeling of passive pleasure by its exercise. The resemblance which his versification presents to that of Milton's minor poems is so striking as only to require mention in order to be acknowledged; and few, we should think, could read his poem on the death of Prince Henry without being reminded of 'Lycidas.' Besides his poetical works, he wrote a history of the five Jameses, kings of Scotland, several pamphlets and tracts, which, with his letters, were published at Edinburgh in 1711. (*Biogr. Brit. and Retrospective Review*, vol. xi.)

DRUPACEÆ, the name given by some botanists to that division of rosaceous plants which comprehends the peach, the cherry, the plum, and similar fruit-bearing trees. They are more generally called *Amygdalææ*.

DRUPE, a closed, one-celled, one or two-seeded seed-vessel, whose shell is composed of three layers, the outer membranous or leathery, the inner hard and bony, the intermediate succulent or fibrous. A peach, a cherry, a mango, are all fruits of this description. A cocoa-nut is a compound drupe, being composed of three consolidated, two of which are abortive; and a date is a spurious drupe, the hard inner shell being represented by a membrane. In theory the stone or inner bony layer of the shell is equivalent to the upper side of a carpellary leaf, the external membrane to the lower surface, and the intermediate pulp or fibre to the parenchyma.

DRUSES, DOROU'Z, a people who inhabit the chain of Libanus, in Syria, are under the government of their own chiefs, and have a religion peculiar to themselves. The vernacular language of the Druses is Arabic. Although the mountaineers of Libanus in general obey the emir, or prince of the Druses, yet they are not all Druses, but a great part, perhaps the greater part, of them are Christians of the Maronite communion, and belong to the western, or Roman church. [**MARONITES.**] There are Syrian Greeks, or Melchites, who belong to the western church, the chief difference between whom and the Maronites is, that the Maronites have their ritual in Syriac, and the others in Arabic. The Druses live together with the Christians in the towns and villages in perfect harmony, but without intermarrying with them. The Druses live chiefly in the south part of Libanus, east and south-east of Beirut, and as far south as the district of Hasbeya, about the sources of the Jordan. But the dominion of the emir of the Druses extends also over the north part of Libanus as far as the latitude of Tripoli, which part of the mountains is chiefly inhabited by Maronites, whose patriarch resides at Canobin, south-east of Tripoli. Towards the east the jurisdiction of the emir extends over part of the Bekaa, or plain intervening between the Libanus and the Antilibanus. North of the Bekaa is the Belad, or district of Balbek, which is inhabited chiefly by Musselmans, and is under a distinct emir of the sect of the Metwalis, subject to the pacha of Damascus; but the emir of the Druses appears to have gained a sort of authority over this district also since Burckhardt's time. The emir of the Druses is tributary to the pachalik of Acre, on condition that no Turk shall reside within his territories.

Burckhardt, *Travels in Syria*; Captain Light's *Travels in Egypt, Nubia, the Holy Land, Lebanon, and Cyprus* in 1814.) The capital of the emir of the Druses is Deir el Kamr, in a fine valley on the west slope of Libanus, about eight or nine hours' ride south-east of Beirut: the town is said to have about 5000 inhabitants, partly Druses and partly Christians. There are two Maronite and two Melchite churches at Deir el Kamr. The town is built in the Italian fashion, and is said to resemble a second-rate country town of Italy. Captain Light saw about twenty silk looms at work round one of the squares. The emir resides at the palace or castle of Bteddin, about one hour's ride from Deir el Kamr. Some of

the apartments of the palace are described as very handsomely furnished, paved with marble, and adorned with rich folding draperies and divans, the walls inlaid with ivory and gilding, and adorned with passages of the Koran and Scriptures in Arabic, in large embossed gilt characters, enclosed in pannels of various size. The Reverend William Jowett (*Christian Researches in Syria*), who visited Bteddin in 1823, describes the palace as like a small town; 2000 persons are said to live in or about it, men of all trades, soldiers, scribes, carpenters, bricklayers, blacksmiths, breakers of horses, cooks, tobaccoconists, &c. Druses and Christians were intermixed together, and even Christian priests were among the attendants of the emir, who is said to have been christened in his youth, and had at one time a confessor, but of late showed no preference to any religion, and treated all his subjects, whether Druses or Christians, with the same impartiality. The emir Beshir, as he was called, was the same whom Captain Light had seen in 1814: he is described as an elderly man of an intelligent and prepossessing appearance, and said to be very regular and abstemious in his habits. He had come to the sovereignty by defeating several competitors, whom he imprisoned and put to death. (Light's *Travels*.) In 1822, having supported the rebellious Abdallah, pacha of Acre, he incurred the displeasure of the Porte, and took refuge in Egypt, but returned soon after by the mediation of Mehemet Ali, the pacha of Egypt. At the time of the occupation of Syria by Ibrahim, Mehemet's son, the Druses joined him at first; they afterwards quarrelled with him; but peace appears now to be restored. The emir has under him several subordinate emirs, or local chiefs, in various districts of the mountains, some of whom are Druses and others Maronites. As the whole population is armed and trained to the use of the gun, it is said that in case of need the emir can collect in a very short time 30,000 men; but this must be only part of the individuals capable of bearing arms, as the Maronite population alone is said to be more than 200,000, and the Druses cannot be much less in number. Dr. Hogg, in his 'Visit to Alexandria, Jerusalem, and Damascus,' London, 1835, has given the latest information concerning the Druses.

The religion of the Druses has been a subject of much inquiry, being involved in a kind of mystery. The Rev. W. Jowett had the following information from the physician to the emir, which agrees with the accounts of former travellers. The Druses are divided into three classes: the Djahelin, or 'the ignorant,' the partially initiated, and the adepts, or fully initiated. The second class are admitted to a partial knowledge of the secret doctrine; they may, if they like, return to the class of Djahelin, but must never reveal what they know. The third class, or adepts, continue late together at their places of meeting on Thursday evenings, performing their rites, after all others have been excluded. Should they reveal what they know they would incur the penalty of death, which would also be incurred by any one who should turn Mussulman or Christian. They make no proselytes. As to the nature of their secret doctrine, we have an account of it in De Sacy's 'Chrestomathie Arabe,' vol. ii.; but how far it can be relied upon is still a question with some, as it depends upon the authenticity of the books from which de Sacy has extracted it. (See also Adler's *Museum Cufico-Borgianum*, Rome, 1782.) Mr. Jowett saw MSS. shown about secretly, purporting to be the sacred books of the Druses, and a set of them was offered to him for the price of no less than 5000 dollars. It appears however pretty certain that the Druses are, or were originally, disciples of Hakem biamr Illa, the sixth Fatemite caliph of Egypt, who in the eleventh century proclaimed himself to be an incarnation of the Divinity, and who established a secret lodge at Cairo, divided into nine degrees, the last of which taught the superfluity of all religions, the indifference of human actions, &c. (Von Hammer, *Geschichte der Assassinen*, 1818.) The Assassins themselves were a derivation of Hakem's sect, which was itself an offshoot of the great schism of the Ismaelites, a remnant of whom still exists in Syria, in the mountains east of Tortosa, near their ancient stronghold Maszyad. (J. F. Roussseau, *Mémoire sur les Ismaélites et les Nosâiris de Syrie*, with notes by de Sacy.) Hakem disappeared, probably by assassination, in one of his solitary walks near Cairo, but his disciples expect his return, when he is to reign over the world. The Druses are said to believe in transmigration. The story of their worshipping a calf's head is variously

told. (De Sacy, *Mémoire sur le culte que les Druses rendent à la figure d'un veau*, in the 2nd vol. of the *Mémoires de la classe d'Histoire et de Littérature Ancienne de l'Institut*.) They are also accused, like the Nossairis, of licentious orgies in their secret meetings, and yet Mr. Jowett was told by Christian residents that as soon as a young Druse becomes initiated, he leaves his former licentious course of life and becomes quite an altered man, at least in appearance. Burckhardt observes on this subject that the Druses are more observant of outward decorum than of genuine morality. All agree however in saying that they are industrious, brave, and hospitable: their country is a land of refuge from Turkish oppression; they pay few taxes, as the emir has lands or domains belonging to him, from which he draws his chief revenue. Silk is the staple article for exportation, by way of Beirout. The mulberry, the vine, the fig, and other fruit-trees, are reared in the lower ridges of the Libanus, while the higher range affords good pastures. Cotton is also cultivated and manufactured. The plains, especially the Bekaa, produce corn. There are a number of convents scattered about the mountains; there is a Maronite college for the study of Syriac at Aain el Warka, and another for the Melchite students at Deir el Mhales. Burckhardt, who crossed the Libanus in different directions, gives the names of many towns or villages inhabited by Druses and Maronites, some of them considerable places, such as Hasbeya, with 700 houses; Zahle, in the Bekaa, with 900; Shirrei, near Tripoli, &c. The Druses dress differently from the Maronites: the men wear a coarse woollen beneesh, or cloak, black, with white stripes, thrown over a waistcoat, and loose breeches of the same stuff, tied round the waist by a sash of white or red linen with fringed ends; their turbau is swelled out from the head into a shape resembling a turnip, and flat at the top. The women wear a coarse blue jacket and petticoat, without any stockings, and their hair plaited and hanging down in tails behind. When they dress they put on their head the Takeel, a hollow tube of silver or tin, from six to twelve inches high, shaped like a truncated cone, over which is thrown a white piece of linen, which completely envelops the body; they also wear silver bobs tied to their tresses. (Light's *Travels*.)

DRUSUS, CLAUDIUS NERO, son of Tiberius Claudius Nero and of Livia, was born in the year 38 B.C., three months after his mother's marriage with Augustus. He served early in the army, and was sent in 17 B.C., with his brother Tiberius, against the Rhæti and Vindelici, who had made an irruption into Italy. He defeated the invaders, pursued them across the Alps, and reduced their country. Horace celebrated this victory in one of his finest Odes (lib. iv. 4). Drusus married Antonia Minor, daughter of Antony and Octavia, by whom he had Germanicus and Claudius, afterwards emperor, and Livia or Livilla. In 14 B.C., being sent to quell an insurrection in Gaul occasioned by the extortions of the Roman tax-gatherers, he succeeded by his conciliatory address. In the following year he attacked the Germans, and carrying the war beyond the Rhine, he obtained a series of victories over the Sicambri, Cherusci, Catti, and Tencteri, and advanced as far as the Visurgis, or Weser, for which the senate bestowed the surname of Germanicus upon him and his posterity. In 9 B.C. Drusus was made consul, with L. Quintus Crispinus. He was soon after sent again by Augustus against the Germans, crossed the Visurgis, and advanced as far as the Albis or Elbe. He imposed a moderate tribute on the Frisians, consisting of a certain quantity of hides, which, being afterwards aggravated by the extortion of his successors, caused a revolt under the reign of Tiberius. (Tacitus, *Ann.* iv. 72.) He caused a canal to be cut, for the purpose of uniting the Rhine to the Yssel, which was known long after by the name of Fossa Drusi; and he also began to raise dykes to prevent the inundations of the Rhine, which were completed by Paulinus Pompeius under the reign of Nero. Drusus did not cross the Albis, probably because he thought he had advanced already far enough: he retired towards the Rhine, but before he reached that river he died, at the age of thirty, in consequence, as it was reported, of his horse falling upon him and fracturing his leg. (Livy, *Epitome*.) Tiberius, who was sent for in haste, and found his brother expiring, accompanied his body to Rome, where his funeral was performed with the greatest solemnity. Both Augustus and Tiberius delivered orations in his praise. Drusus was much regretted both by the army and by the Romans in general, who had formed great expectations from his manly

P. C., No. 551.

and generous sentiments. One of his grandsons, Drusus, son of Germanicus and of Agrippina, was starved to death by order of Tiberius, and Nero, the other, was put to death in the island of Ponza.

Coin of Drusus.

British Museum. Actual Size. Copper. Weight, 488 grains.

DRUSUS, the son of Tiberius by Vipsania, daughter of Agrippa, served with distinction in Pannonia and the Illyricum, and was consul with his father A.D. 21. In a quarrel he had with the favourite Sejanus, he gave him a blow in the face; Sejanus, in revenge, seduced his wife Livia or Livilla, daughter of Drusus the elder and of Antonia, and the guilty pair got rid of Drusus by poison, which was administered by the eunuch Lygdus. The crime remained a secret for eight years, when it was discovered after the death of Sejanus, and Livia was put to death. (Tacitus, *Annal.*)

DRYANDRA, a genus of Australian shrubs, with hard dry evergreen serrated leaves and compact cylindrical clusters of yellow flowers, seated upon a flat receptacle, and surrounded by a common imbricated involucre. It is in the latter respect that the genus principally differs from Banksia.

The species are much esteemed by cultivators for their beautiful evergreen leaves. They are commonly regarded as greenhouse plants, but will, in several cases, survive an English winter without injury, if protected by a glass roof in winter, and planted among rockwork high above the dampness of the level of the soil.

DRYDEN, JOHN, was born about the year 1631 or 1632*.

Tradition gives Aldwinckle in Northamptonshire as his birth-place; but this much only is certain, that his father, Erasmus *Driden*, was the third son of Sir Erasmus Driden of Canons Ashby, in that county, who was created a baronet in 1619. The poet was educated at Westminster school under Dr. Busby, and came up as a Westminster scholar to Trinity College, Cambridge, May 11, 1650.

Almost the only notice which the college archives give respecting him is one dated July 19th, 1652, whereby he is 'put out of Commons for a fortnight at least,' confined to walls, and sentenced to read a confession of his crime at the fellows' table during dinner time†.

In 1654 his father's death put him in possession of an estate worth about 60*l.* per annum; he did not however leave Cambridge till three years afterwards, when he was introduced into a subordinate public office by his maternal relation Sir Gilbert Pickering. The stanzas on Cromwell's death, his first poem of any importance, were written in the following year, and in 1660 he signalized himself by 'Astræa Redux,' a congratulatory address on the Restoration.

It seems scarcely worth while attempting to excuse this change of views. Dryden was yet a young man, and had probably never before been in a situation to express his own opinions, apart from the influence of his kinsman; and after all, the lines on Cromwell contain, as Sir W. Scott has observed, little or nothing in the way of eulogy which his worst enemies could have denied him. In the year 1663 Dryden began his dramatic career with 'The Wild Gallant.' The plague and fire of London soon interrupted him for a time, and he employed himself upon his 'Essay on Dramatic Poesy,' a performance containing much elegant writing, and worthy of notice as the earliest regular work of the kind in our language. It would be easy to show the deficiencies and mistakes of this composi-

* The monument in Westminster Abbey says 1632, but as it was not put up until twenty years after his death, the point is somewhat doubtful.

† What he could be doing in Cambridge during the long vacancy is not so clear; but perhaps those on the foundation have, as now, always claimed the right of staying there.

tion, but they are fully counterbalanced by that manly avowal—the first since the Restoration—of the supremacy of Shakspeare. About this time he married a daughter of the first Earl of Berkshire.

On the revival of stage plays, he engaged to supply the King's Theatre with three plays a year, for the annual sum of 300*l.* to 400*l.* Malone has proved that the number really produced was far less than this, and did not amount to more than eighteen in sixteen years, while Shakspeare wrote, as is probable, two plays a year for several years, and Fletcher with assistance wrote more than thirty in ten years.

Towards the end of 1671, that celebrated attack on heroic dramas called the 'Rehearsal' was produced on the stage. Its effect, though sure, was not immediate; except that Dryden exchanged tragedy for comedy, and composed two comedies in 1672. A few years afterwards he took leave of rhyme; his last rhyming tragedy called 'Aureng-Zebe,' being brought out in 1675; but he continued to write for the stage until 1681, when the struggle between the parties of the Dukes of Monmouth and York seemed drawing to a crisis, and there appeared some need that the scurrilous abuse which had been in every way poured on the court party by means of epigram and satire should be rebutted in similar fashion.

This Dryden effected by the famous satire called 'Absalom and Achitophel,' wherein Monmouth figures as Absalom. Monmouth is treated with great levity, but all the vials of the poet's wrath are poured out on Buckingham, the author of the 'Rehearsal,' as Zimri, and on Shaftesbury as Achitophel. The last-named nobleman had been committed to the Tower, not long before, under a charge of high treason: he was however released upon the grand jury's refusal to find a true bill against him, which the Whig party celebrated by a medal struck for the occasion. This afforded Dryden a fresh subject, and in March, 1681, appeared 'The Medal,' a bitter lampoon on Shaftesbury, followed up in the next year by 'Mac Flecknoe,' and the second part of 'Absalom and Achitophel*,' which united gave the finishing stroke to his old enemies Settle and Shadwell, besides a numerous host of petty satirists. With Settle he had quarrelled some years before, whose chief supporter, Rochester having become implicated, and suspecting Dryden of indulging anonymous revenge, caused him to be attacked and beaten by bravos. This occurred in 1679.

During the four years from 1682 to 1685 Dryden produced nothing worth notice, with the exception of a translation of Maimbourg's 'History of the League,' undertaken, as Dr. Johnson says, to promote popery. We should be at a loss to account for this apparent want of purpose, but an event which occurred in the year last mentioned clears up the difficulty. Soon after the death of Charles II. Dryden turned Roman Catholic—not without due consideration—as the 'Religio Laici,' written nearly four years before, contains sufficient evidence of his mental struggles at that period, and not, it is to be hoped, otherwise than conscientiously, as indeed his subsequent conduct appears to show.

In 1690 Dryden returned to his old employment, and produced four plays between that year and 1694. This was no doubt owing to poverty, as the Revolution deprived him of the laureatship, which he had obtained on the death of Davenant in 1668, and the expenses of his family were now increasing. For the next three years he was busied in his translation of the *Æneid*, and about the same time with it appeared his celebrated ode on St. Cecilia's day†, which is perhaps one of the finest pieces of exact lyrical poetry which our language possesses, although not to be named with Wordsworth's Platonic ode.

In the middle of 1698 he undertook his adaptations of Chaucer, and about a year and a half afterwards completed his *Fables*. His last work,—a masque, with prologue and epilogue,—was written about three weeks before his death, which happened, after a short illness arising from neglected inflammation of the foot, May 1st, 1700. He was buried in Westminster Abbey, where a monument was erected to his memory by John duke of Buckingham. A portrait of him hangs in the hall of Trinity College, Cambridge.

It is extremely difficult to form an opinion on the character of a man of whose life we possess such scanty notice, and who, for the greater part of his literary career, wrote entirely to please others. Congreve has left a description of

him, which, if it can be trusted, ensures for him the praise of modesty, self-respect, true-heartedness, and a forgiving spirit. His manners are said to have been easy without forwardness; but there seems little doubt that his powers of conversation were rather limited. It does not seem necessary that we should attribute his extreme indelicacy as a writer to corresponding coarseness or impurity as a man.

The close connexion which existed between the Cavaliers and the court of France had tended much to vitiate the taste of those who were the received judges of literary merit. To the Italian sources, whence Spenser and Milton drew, was preferred the French school; and the consequences are as apparent in the grossness of Dryden's comedies as in the stilted and extravagance of his heroic drama*. Perhaps no nation ever had so little national poetry as the French; whence the extreme worthlessness of that school in England which professed to imitate them. But of all French poetry the heroic drama, from which Dryden copied, is perhaps least worthy imitation. The characters are not real, neither are they such as we should wish to see existing. They excite our surprise without engaging our sympathies. Poems such as Boileau's are only the legitimate offspring of a very artificial age. We may be astounded at the flattery which characterizes his 'Discours au Roi,' or amused at the bigotry of his 'Ode on the English;' but there is much pleasing versification to compensate for these defects. The same may be said of Pope in our own country; he will always find admirers: but who ever reads Dryden's plays? Those who deny to Pope the name even of poet will allow him to be an amusing and at times an instructive writer; but the heroic drama can serve to no end either of amusement or instruction. There is another class of poets, whose influence revived for a short time after the Restoration, those whom Dr. Johnson has with no reason at all called the metaphysical poets; and one of Dryden's chief excellencies is, that he soon saw reason to desert their bombastic absurdities for a more chaste style; although the fashion of the day, which he alternately led and followed, obliged him occasionally to make use of expressions such as his better taste must have disowned. He appears to have been very late in discovering that style for which he was most fitted, namely, satire, in which he has never been surpassed, and rarely equalled. His translations of Virgil and Juvenal deserve very high praise, particularly when they are compared with the style of translation usual in his time. In his version of Chaucer he has not been so successful. That substitution of *general* for *particular* images which characterizes the performance is always a step away from poetry. Perhaps the most striking instance of the superiority of Chaucer is that description of the Temple of Mars which occurs towards the close of the second book of 'Palamon and Arcite' in Dryden, and a little past the middle of Chaucer's 'Knight's Tale.' This passage is also curious as an instance of Dryden's hatred of the clergy; he introduces two lines to convert Chaucer's 'sailer with the knife under the cloak' into a priest.

Dryden's prose works consist mostly of dedications, the extravagant flattery of which is only palliated by custom. His 'Essay on Dramatic Poesy' has been already noticed. He also wrote Lives of Polybius, Lucian, and Plutarch (*Biog. Brit.*), and assisted in translating the last-named author: perhaps, however, only from the French.

Dr. Samuel Johnson has been highly praised for his critique on Dryden. He has not, however, escaped that spirit of verbal criticism which was so prevalent in his days; and his comparison of our poet with Pope shows how little competent he was to do more than judge of the externals of poetry. Sir Walter Scott's life of Dryden is a beautiful piece of critical biography, uniting research only equalled by Malone's to taste and style of an order far surpassing Johnson's.

(Langbaine's *Dramatic Poets*; Johnson's, Malone's, and Scott's *Lives of Dryden*; *Quarterly Review* for 1826; *Edinburgh Review*, 1808; *Biographia Britannica*; *Life of Sir W. Scott*, vol. ii.)

DRYOBALANOPS, a genus established by the younger Gartner, from specimens of the fruit found in the Banksian collection, supposed by him to belong to the tree which yielded the best cinnamon. But Mr. Colebrook, from specimens sent to Dr. Roxburgh, which in the absence of the latter he received, ascertained that the fruit belonged to the

* Partly written by Tate.

† This was the second on that subject. The first he wrote in 1697.

* It should be observed that Spain was the birthplace of that form of comedy which Dryden derived immediately from France.

camphor-tree of Sumatra, which he accordingly named *Dryobalanops camphora*, 'until its identity with *D. aromatica* (of Gærtner) be established.' (*Asiat. Researches*, xii.) Dr. Roxburgh had, in his MS. Flora Indica, already named it *Shorea camphorifera*. Some botanists are of opinion that the genus is not sufficiently distinguished from *Dipterocarpus*, but Blume, the latest author, and one who has had the fullest opportunity of examining the subject, has, in the article on *Dipterocarpaceæ*, in his 'Flora Javæ' given it as his opinion that *Dryobalanops* should be kept distinct; as, like *Shorea*, it has all five instead of only two of its sepals prolonged into long foliaceous wings, while its cotyledons are unequal and rumpled.

According to Blume, the existence of this camphor-yielding tree was first indicated by Grimm in *Ephem. Nat. Cur.* Kämpfer was so well acquainted with its distinctness, that in describing the Camphor-tree of Japan (*Laurus Camphora*), he says, 'that natural camphor, of crystal-like appearance, which is scarce and of great value, is furnished by a tree of Borneo and Sumatra, which is not of the Laurel genus.' The first notice of the tree is in the 4th volume of the *Asiatic Researches*, where we learn that a tree near Tappanooly on the west coast of Sumatra yielded above 3 pounds of camphor, and at the same time near 2 gallons of camphor oil; that the tree resembles the bay in leaves, is fond of a rich red loam tending to a blackish clay, and that it grows principally on the north-west coast of Sumatra, from the Line to 3° of north lat. The fullest account is given by Mr. Prince, resident of Tappanooly, who describes the tree as growing spontaneously in the forests, and as being found in abundance from the back of Ayer Bongey as far north as Bacongan, a distance of 250 miles: he says that it may be classed among the tallest and largest trees that grow on this coast; several within daily view measuring 6 or 7 feet in diameter. But it will produce camphor when only 2½ feet in diameter. The same tree which yields the oil would produce camphor if unmolested, the oil being supposed to be the first state of the secretion, which ultimately changes into concrete camphor, as it occupies the same cavities in the trunk which the camphor afterwards fills: consequently it is found in young trees. The produce of camphor of a middling-sized tree is about eleven pounds, and of a large one double that quantity. (*Fl. Ind.* ii. p. 616.) As stated in the article CAMPHOR, this kind of camphor is very highly esteemed by the Chinese. It is commonly called Malay Camphor, or Camphor of Barus, from the port of Sumatra whence it is mostly shipped. Its price in China is 100 times greater than that of the common camphor of commerce. (*McCulloch's Com. Dic.*) In the same work it is mentioned that camphor oil being nearly as cheap as spirits of turpentine, might perhaps be profitably imported into England as a substitute for that article or for medicinal use.

Camphor, which in many respects resembles the essential oils, has been shown by Dumas to be an oxide of hydrocarbon identical in composition with pure oil of turpentine; hence the term *camphene* has been applied to it. But Dr. Thomson informs us that its camphor oil differs in some respects from camphene, as he was not able to produce camphor with the same facility or in equal quantity by driving a stream of oxygen gas through highly rectified oil of turpentine, which Dumas regards as *pure camphene*.

DRY ROT, a well-known disease affecting timber, and particularly the oak employed for naval purposes. When dry rot is produced by the attacks of fungi, the first sign of it consists in the appearance of small white points, from which a filamentous substance radiates parallel with the surface of the timber. This is the first stage of growth of the seeds of the fungus, and the filamentous matter is their thallus or spawn. As the thallus gathers strength it insinuates its filaments into any crevice of the wood, and they, being of excessive fineness, readily pass down and between the tubes from which the wood is organized, forcing them asunder, and completely destroying the cohesion of the tissue. When the thalli of many fungi interlace, the radiating appearance can no longer be remarked; but a thick tough leathery white stratum is formed wherever there is room for its development, and from this a fresh supply of the destructive filamentous thallus is emitted with such constantly increasing rapidity and force, that the total ruin of timber speedily ensues where circumstances are favourable for the growth of the fungi.

It is generally stated that dry rot consists of the thallus of *Merulius lacrymans*, or *Polyporus destructor*, two highly-organized fungi, whose fructification is sometimes found upon rotten timber. But it is a great mistake to suppose that dry rot belongs exclusively to those two species, or that they are even the common origin of it; on the contrary, there is reason to believe that any of the fungi that are commonly found upon decaying trees in woods are capable of producing dry rot, and it is quite certain that one of the most rapidly-spreading and dangerous kinds is caused by the ravages of different species of *Sporotrichum*. The latter throw up from their thallus whole forests of microscopic branches loaded with reproductive spores, of such excessive smallness that they may insinuate themselves into the most minute crevices or flaws even in the sides of the tubes of which timber consists, and they are infinitely more dangerous than *Merulii* or *Polypori*, which seldom fructify. It is the genus *Sporotrichum* that at the present moment is causing the dry rot in ships under repair at Sheerness.

The circumstances that are most favourable to the development of the dry rot fungi are damp, unventilated situations, and a subacid state of the wood. The latter condition, especially in oak, is easily produced by a slight fermentation of the sap which remains in the timber, especially if the latter has not been well seasoned before being employed. It has been proved experimentally that fluids which, in their ordinary state, will not produce fungi generate them abundantly if ever so slightly acidulated. Dutrochet found that distilled water holding in solution a small quantity of white of egg will not generate fungi in a twelvemonth, but upon the addition of the minutest quantity of nitric, sulphuric, muriatic, phosphoric, oxalic, or acetic acids, it generated them in eight days' time in abundance. Alkaline infusions possess the same property. This observer also found that the only poisons which will prevent the appearance of fungi are the oxides or salts of mercury. A solution of fish-glue yields fungi rapidly and in great abundance; but a small quantity of red precipitate or corrosive sublimate destroys this power entirely. It is moreover an important fact that no other mineral preparation has any such properties. Dutrochet ascertained that other metallic oxides acted differently. Oxides of lead and tin hastened the development of fungi; those of iron, antimony, and zinc, were inert; and oxides of copper, nickel, and cobalt, although they retarded the appearance of fungi, yet did not prevent their growth in the end. These facts confirm in a striking manner the statement of Mr. Kyan, as to the impossibility of timber, steeped in a solution of corrosive sublimate, becoming a prey to dry rot, so far as dry rot is produced by a fungus.

Of **ANIMAL DRY ROT**, that is, of death caused in animals by the attack of fungi, little was known till lately, and great doubt was entertained respecting its existence. And yet, if the subject is rightly considered, there is nothing improbable in its occurrence: it is well known that living vegetable matter is subject to the ravages of fungi, as in all the cases of mildew, smut, rust, &c., with which the farmer is familiar, and therefore there is no intelligible reason why living animal matter should be exempted from the same fate. Specimens of hymenopterous insects resembling wasps have been brought from the West Indies, with a fungus allied to *Sphæria militaris* growing from between their anterior coxæ, and it is positively asserted by travellers that the insects fly about while burthened with the plant. Upon opening the bodies of the wasps they are found filled with the thallus of the fungus up to the orbits of the eyes and the points of the tarsi; the whole of the intestines being obliterated. In such cases it is to be supposed that the thallus of the *sphæria* first kills the wasp by compressing and drying up the body, and then, continuing to grow, occupies the whole of the cavity of the shell of the insect. A more common instance of animal dry rot is the disease in silk worms called *La Muscadine*. Silk-worms of all ages are occasionally liable to become sickly and to die, soon after death becoming stiff, and acquiring such a degree of firmness as to be readily broken. They then throw out from their surface a sort of white efflorescence, which is the fructification of the fungus called *Botrytis Bassiana*, their inside being filled by the thallus of the same plant. If some healthy caterpillars are placed beneath a bell-glass, along with a small portion of worm killed by the *Botrytis*, they soon catch the disease, exhi-

bit the same symptoms as those already mentioned, and eventually perish; having, no doubt, been infected either by rubbing themselves against the dead worm, or, which is more probable, having received upon their skins the infinitely minute seeds dispersed by the *Botrytis*. If healthy crysalids are inoculated by the introduction below their shell of a little of the *Botrytis* matter upon the point of a needle, they also sicken and die.

In these cases effects are produced upon insects similar to those upon timber; that is to say, vitality in the one case and cohesion in the other is destroyed by the growth of the thallus of certain fungi, which spread with great and irresistible rapidity, and fructify where occasion offers.

DSHIKKETEI (*Zikketei*). Cuvier writes the word *Drigguetai*, and Bufon *Dzighai*, the native name for the *Equus Hemionus* of Pallas, *Asinus Hemionus* of Gray. [HORSE.]

DUAL NUMBER. The Greek, Sanscrit, and Gothic of antient, and the Lithuanian of modern languages, in addition to the undefined plural which they share with other tongues, possess also forms of the verb and noun in which two persons or things are denoted, called the dual number. On a careful consideration of the suffixes which are supposed to convey this notion, there seems reason for believing that the idea of duality was not originally contained in them, but simply that of unlimited plurality.

The suffix of plurality which belongs to the Indo-Teutonic languages seems to have had two forms, *en* and *es*, as in the English *housen* and *houses*. Thus the Greeks had two forms for the first person plural of their verbs active, *tuptomen* and *tuptomes*. In the second person, the Latin language gives the suffix *itis*, *scribitis*; probably the Greek, in its oldest character, would have presented us with a suffix *tes*, but the forms of that language which have come down to us give only the abbreviated *te*, *tuptete*. But if there existed a double form for the second person as well as for the first, we should in that case have also *tupteten*, or rather *tupteton*, seeing that to the Greek ear *ton* was a more familiar termination. In the third person the dual *ton* might well represent a plural, as the oldest form of that person in the singular gives a suffix *ti*, *esti*; and this, with the plural termination *n*, would produce a syllable which might readily take the same shape as the second person dual.

In the nouns the same analogy prevails. The nominatives and genitives of the dual and plural differ no more than might be expected in two dialects; in the dative, the difference consists in the one number having a final *n*, the other an *s*; while the accusative dual has lost the final sigma, a fate common enough with that letter in the Greek language, as may be seen even in the plural nominatives, *mousai*, *logoi*, which the analogy of the other declensions proves to have once possessed that letter. We have already seen an example of the same loss in the second person plural of the verb. In the pronouns, again, the same confusion of the two numbers prevails. Thus the Greek dual of the pronoun *I* contains the very same element, *no*, which in the Latin is appropriated to the plural.

In the Gothic verb the same principle may be traced. A specimen may be seen in the second person dual which has the suffix *is*, a form more closely approaching the old plural suffix *itis*, which has been above mentioned, than even the *th*, which is the suffix of the same person in the plural.

Again in the Lithuanian, while the first person plural of the verb, which ends in *ma*, has derived that suffix from the older form *mus* or *mes*, the dual of the same person ends in *wa*, which has a strong resemblance to our plural *we*. The same observation applies to the Sanscrit verb of the *Parasmaipadam* form of the potential and imperative moods, and of the preterites called by Bopp 'Præteritum augmentatum uniforme et multiforme.' The terminations of the first persons of the dual and plural respectively in the present of the *Parasmaipadam* are *was* and *mas*; of the second and third persons dual respectively, *thas* and *tas*; and of the second person plural, *tha*.

If it be admitted then that the dual in its origin was not confined to the notion of two, it remains to consider how that notion was superadded. Perhaps the following may not be an unreasonable conjecture. In many countries there are two or more dialects co-existing, one among the educated and in towns, the other belonging more particularly to the cottage. In the places of public meeting, whether for religious or political purposes, the dialect which happens to belong to the more educated class will prevail,

while the other, as genuine, though not so fortunate a dialect, will still maintain its ground by the fireside. The former will be addressed to hundreds, the latter commonly to one or two individuals. Hence the colloquial and friendly dialect of the cottage may well be borrowed by even the public speaker when speaking of two persons; and thus the notion of duality which at first was only accidentally united with a certain suffix becomes in the end the inseparable and essential meaning thereof. Something parallel to this may be seen in the double forms of the English verb *to be*. While *am*, *art*, *is*, are honoured by the favour of the learned, the unlearned still retain, and with as good a title, the genuine forms *be*, *best*, *bes* or *be*. These are both indicatives, yet it is already a common practice to look upon the latter set of forms as constituting a subjunctive.

An interesting discussion by William Humboldt on the dual is printed in the Transactions of the Academy of Sciences of Berlin for the year 1827 (*Abhandlungen der historisch-philologischen Klasse der Königl. Academie der Wissenschaften zu Berlin*, aus dem Jahr 1827,) page 161-187, to which we refer our readers, though the views explained in that essay differ from those in the present article.

DUBLIN, an archbishopric of Ireland, including the dioceses of Dublin, Kildare, Ferns, Leighlin, and Ossory; and extending over the counties of Dublin, Wicklow, Wexford, Kilkenny, Carlow, Kildare, Queen's County, with the exception of one parish, and part of King's County. By act 3rd & 4th William IV., c. 37, sec. 46, so soon as the archiepiscopal see of Cashel becomes void, the jurisdiction of the archbishopric of Cashel is to be vested in the archbishop of Dublin for the time being.

In 1834 the total population of this province was 1,247,290; of whom there were 177,930 members of the Established Church; 1,063,681 Roman Catholics; 2,517 Presbyterians, and 3,162 other Protestant Dissenters; being in the proportion of rather more than 13 Roman Catholics to 3 Protestants of whatever denomination. In the same year there were in this province 1612 daily schools, educating 108,474 young persons; being in the proportion of 8 $\frac{1}{2}$ per cent. of the entire population under daily instruction, in which respect Dublin stands second among the four ecclesiastical provinces of Ireland. Of these schools there were in the same year 204 in connection with the National Board of Education.

DUBLIN, a bishop's see in the ecclesiastical province of Dublin. The chapter consists of dean, precentor, chancellor, treasurer, two archdeacons, and nineteen prebendaries. The collegiate chapter of Christ Church, in Dublin, consists of dean, precentor, chancellor, treasurer, archdeacon, and three prebendaries: this deanery has heretofore been held in commendam with the bishopric of Kildare. By 3rd & 4th William IV., cap. 37, sec. 50, the deanery of Christ Church, when next void, is to be united as to spiritualities, with the deanery of St. Patrick; and the temporalities, as portion of the revenue of the see of Kildare, are to be vested in the ecclesiastical commissioners.

This see comprehends the county of Dublin, the greater part of the county of Wicklow, parts of Carlow and Kildare, and some small portions of King's and Queen's Counties. In 1834 it contained 178 parishes, constituting 95 benefices, in which there were 124 churches of the Establishment, 9 other places of worship in connection therewith, 121 Roman Catholic ditto, 7 Presbyterian ditto, and 27 other places of Protestant worship. The gross population in the same year was 501,977; of whom there were 106,599 members of the Established Church, 391,006 Roman Catholics, 2290 Presbyterians, and 2082 other Protestant Dissenters, being in the proportion of rather more than seven Roman Catholics to two Protestants of whatever denomination. In the same year there were in this diocese 509 daily schools, educating 37,219 young persons; being in the proportion of 7 $\frac{1}{2}$ per cent. of the entire population under daily instruction, in which respect this diocese is much inferior to the province at large, and ranks on a par with the see of Cork, nineteenth among the 32 dioceses of Ireland. Of the above schools, 62 were in the year 1834 in connection with the National Board of Education.

There is no certain mention of the see till the seventh century. In the year 1152 it was erected into an archbishopric in the person of bishop Gregory; and in 1214 it was united with the see of Glendaloch, which had been founded in the sixth century. The archbishops of Dublin

did not, however, obtain full possession till the year 1479. The union of the sees of Dublin and Glendaloch still subsists.

The first Protestant archbishop of Dublin was George Browne, who had been an Augustinian friar of London. The present (1837) archbishop is Dr. Whateley. The archiepiscopal residences are St. Sepulchre's, now disused, and converted to a police barrack; at Tallaght, where archbishop Hoadley repaired the old mansion in 1729; and in Stephen's Green, in Dublin.

DUBLIN, a county in the province of Leinster in Ireland; bounded on the north-west and north by the county of Meath; on the east by the Irish channel; on the south by the county of Wicklow; and on the south-west by the county of Kildare. Greatest length from Gormanstown on the north to Bray upon the south, 25 Irish, or 31½ English miles. Greatest breadth from the promontory of Howth upon the east to the boundary of Kildare at Leixlip on the west, 15 Irish, or 18½ English miles. The coast line from Bray to the point of junction with Meath is about 55 Irish, or 70 English miles. Until the publication of the Ordnance Survey Map of Dublin, the area cannot be stated with certainty. It is given by Dr. Beaufort at 228,211 statute acres, or 355 square statute miles, including the county of the city of Dublin. According to the more accurate survey made for the grand jury in 1821, by Mr. Duncan, the superficial contents are, arable 132,042 acres; not arable 16,191 do. Total, exclusive of county of city, 148,233 acres. Exclusive of the county of the city of Dublin, the population in 1831 was 176,012.

The county of Dublin, excepting a small tract on the south, is a champaign country highly cultivated. The only portions of the county not under cultivation are the promontory of Howth, and the range of mountains which separates Dublin from Wicklow on the south. The Dublin mountains, of which the central group has an average height of 1000 or 1200 feet, are partially separated from the loftier elevations of the county of Wicklow by the valley of Glencullen on the east, and by that of Ballynascorney or Glenismael on the west; a neck of elevated land, intervening between these valleys, connects the advanced range with the group of Kippure and Seeshon on the south. The elevation of Kippure, part of which is in the county of Dublin, is upwards of 2700 feet. The whole range forms a fine mountain back-ground to the rich scenery of the plain of Dublin.

The northern part of Dublin county is more undulating than the immediate vicinity of the capital. A low range of cultivated eminences, called the Man-of-War Hills, extends across the line of communication with Meath and Louth, and the ground on the north-western border next Meath and Kildare is pretty much broken by picturesque valleys. The only marked eminences, however, north of the mountainous tract, are the islands of Lambay and Ireland's Eye, and the hill of Howth. The isthmus which connects Howth with the mainland is a low narrow neck, which gives Howth very much the appearance of an island. The highest point of the promontory of Howth is 567 feet above the level of the sea. The cliffs towards the bay and channel are lofty, and the whole promontory contributes much to the picturesque effect of Dublin bay.

The principal creeks north of the bay of Dublin are those of Baldoyle, Malahide, and Rogerstown; but these tide-harbours are of little commercial advantage. The only tolerable harbour north of Howth is that of Balbriggan. The town of Balbriggan, which in 1831 contained 3016 inhabitants, has taken its rise almost solely in consequence of the construction of a pier here by the late Baron Hamilton, who received 1500*l.* towards this work from the Irish parliament in 1761, and a further sum of 3752*l.* for the same purpose in 1765. The total cost is stated at upwards of 15,000*l.* The quay is about 600 feet in length, and is frequently occupied with craft; but it would still require a large expenditure to make it complete for vessels of the second class. From 80 to 100 cargoes of coal are annually delivered here, besides rock-salt, bark, slates, &c. There is an excellent light-house on the pier-head, built by the Ballast Board. Four miles south from Balbriggan is Skerries, the chief fishing village on the east coast of Ireland, with a pier for small craft 450 long, built in 1755.

South of Skerries the sandy shore gives place to a limestone cliff as far as the creek of Loch Shinney, another site well adapted for the construction of a harbour. One mile

south from Loch Shinney is Rush, a considerable village, with a small pier for fishing boats. Off the creek of Malahide is the rocky island of Lambay. In 1821 the population was only thirty-four. There is good anchorage all round the island in five to eight fathoms water, clear ground; it has also a small pier and harbour. The Muldowny bank lying off the creek of Malahide is a good artificial oyster bed. The peninsula of Howth contains about 1500 acres, and excepting towards the low isthmus which connects it with the mainland, stands in deep water. The sound between Howth and Ireland's Eye, a rocky picturesque island of thirty acres, which lies about three quarters of a mile off the northern side of the promontory, being a sheltered situation with considerable depth of water, was selected by government in 1807 for an asylum and packet harbour; but unfortunately this object has not been accomplished. The work, which was completed under the direction of the late Mr. Rennie, consists of two piers, of which that on the east is 2493 feet in length, and that on the west 2020 do. On the extremity of the eastern pier is a lighthouse. The entrance between the extremities of the piers is 300 feet across; and the space enclosed 52 English acres. The whole work is faced with cut granite, except the sloping glacis under water which is of red grit from Runcorn in Cheshire. The entire amount expended on Howth harbour from the 2nd July, 1807, to 5th January, 1832, was 420,472*l.* 8*s.* 5½*d.* The deepest and best anchorage afforded by the sound is left outside the piers; one-half of the space enclosed is dry at half-ebb, and two-thirds at low-water; and the sands from the bank on the west side are daily accumulating in the entrance; so that the mail packets for want of water in the basin have been latterly transferred to the Kingstown station. From Howth round to the sands of the North Bull the whole of the promontory which stands in deep water is rocky and precipitous towards the sea. On a detached rock at the south-eastern extremity, called the Bailey, stands a lighthouse, which marks the northern entrance to the bay of Dublin. Another lighthouse now disused stands on the brow of the promontory above, a little to the north.

From the Bailey of Howth to the island of Dalkey at the opposite extremity of the bay of Dublin, is a distance of 6½ English miles. Between these points the bay recedes in a semi-elliptical sweep to a depth of about six miles inland. The shore surrounding the head of the bay, where the Liffey, Tolka, and Dodder rivers empty themselves, is low: it rises, however, towards Blackrock and Kingstown, and beyond the latter town is of a very bold and picturesque character. The river of Bray, which discharges itself about half a mile north of the bold promontory of Brayhead, is the county boundary.

As a harbour, the bay of Dublin is materially encumbered by a great tract of sand, which is bisected by the Liffey in a direction from west to east. The portion on the north of the Liffey is called the North Bull, and that on the south the South Bull. In order to protect the navigation of the Liffey from the sands of the South Bull, a pier consisting of a mound of gravel contained between double stone walls was undertaken by the Irish government in 1748. It runs from the suburb of Ringsend along the northern margin of the South Bull, to a distance of 7938 feet. Here the main work at first terminated in a basin and packet station, called the Pigeon-house; and the remainder of the channel, extending 9816 feet from the Pigeon-house to the north-eastern extremity of the Bull, was protected by a range of frame-work and piles. The expense however of keeping this part of the wall in repair was found so heavy, that in 1761 a light-house was commenced at the extremity of the Bull, and from it the wall was carried inwards towards the Pigeon-house until completed in 1796. This sea-wall is composed of two parallel walls of hewn granite, alternate headers and stretchers, laid without cement. The space between is filled to a certain height with gravel and shingle; over which is a course of stone-work imbedded in cement; and the whole is finished on the top with a course of granite blocks of large dimension, laid in tarrass. The wall is thirty-two feet broad at bottom, and twenty-eight at top. The Pigeon-house, since being disused as a packet station, has been converted into a strong dépôt for artillery and military stores. The amount of parliamentary aid given to the construction of the south wall from 1753 to 1780, was 57,169*l.* 4*s.* 6*d.* Another wall, running nearly south-east from the opposite shore of Clontarf, is intended in like manner to

confine the sands of the North Bull, and to scour the channel. This, which is called the north wall, has been constructed by the Ballast Board of Dublin, and cost from 1819 to 1824 a sum of 103,054*l.* 19*s.* 11*d.* Notwithstanding these great undertakings, the navigation of the Liffey is still very imperfect, and requires constant dredging. The bar, on which there are but five feet of water at spring-ebbs, runs across the channel immediately outside the light-house.

The insecurity of the bay, joined to the failure of the works at Howth, led to the commencement of the present noble asylum harbour of Kingstown, on the site of the old harbour of Dunleary, on the south side of the bay, in 1817. The small pier and tide harbour at Dunleary have been enclosed within the new works, and are now crossed by the Dublin and Kingstown railroad. The new harbour is entirely artificial, consisting of an area of about 200 acres contained between two piers, of great dimension. There is a depth of 24 feet at the pier-head, at the lowest springs, which is sufficient for a frigate of 36 guns, or an Indianan of 800 tons. The work was commenced under the authority of two acts of the 55th and 56th George III.; the latter of which grants certain duties on all vessels entering the port of Dublin, to be vested in commissioners for carrying the work into execution.

The Liffey has a course of little more than eight miles from the point where it enters Dublin county to the bay of Dublin at Ringsend. It is navigable for vessels of 200 tons to the Custom-house, and for barges and row-boats to Chapel Izod, about two miles farther up. The Dodder, the course of which lies almost wholly within this county, takes its rise from numerous small streams descending from Kippure mountain, and forming a rapid stream which descends in a course of about ten miles into the bay of Dublin at Ringsend. The Tolka is a small river rising near Dunbryna in the county of Meath; it flows east by south, through Blanchardstown and Glasnevin to the north-western extremity of Dublin bay, which it enters by Ballybough bridge.

The Royal Canal running west by north from its chief terminus at Broad-stone on the north-west of the city of Dublin, unites the capital with the Upper Shannon at Richmond harbour in the county of Longford. A short branch encircling the north-east of the city connects the basin at Broad-stone with docks opening into the Liffey east of the Custom-house. The width of the line throughout, at top is 42 feet, and at the bottom 24 feet, with locks, and a depth of water calculated for boats of from 80 to 100 tons. The entire length of the canal from the Liffey to the Shannon is 91 English miles. Loch Oil, in Westmeath, supplies the summit level, which is at a height of 307 feet above high-water mark in the Liffey docks. The supply of water to the northern part of the capital is drawn from the Royal Canal. The canal is the property of a company of subscribers which was incorporated by royal charter in 1789.

The chief terminus of the Grand Canal, the most important line of water-carriage in Ireland, is at James's Street Harbour, on the south-west of the city, from which it crosses the counties of Dublin, Kildare, and King's County, in a direction west by south to the Shannon at Shaanon Harbour, about two miles north of Banagher. The summit level commencing at 17 Irish miles from Dublin, is 261 feet 10 inches above the tide-water in the Liffey. This level is supplied by the Middletown and Blackwood rivers, which are branches of the Barrow; and is ascended from James's Street Harbour by four double and fourteen single locks. The total length from the western extremity of the capital is 79 English miles. From the summit level, at a distance of 20½ Irish miles from Dublin, a branch of similar dimensions with the main trunk descends 103 feet half an inch in 22½ Irish or 28½ English miles, through two double and nine single locks, by Rathangan and Monasterevan to the navigable river Barrow at Athy. The dimensions throughout are, at the top, 45 feet; at the bottom, 25 feet; the depth of water, 6 feet in the body of the canal, and 5 feet on the sills of the lock-gates. The locks are generally 70 feet long, 14 wide, and calculated to pass boats of 60 tons in from two and a half to five minutes.

The Grand Canal has a second terminus in an extensive range of docks covering an area of 25 English acres on the south side of the Liffey near Ringsend. The communication with the river is by three sea locks, and the basins

within are capable of containing 600 sail in 16 feet of water. Attached are three graving-docks for vessels of different dimensions, with several extensive piles of stores; the whole being surrounded by spacious wharfs. This portion of the works has failed in a remarkable manner. The stores have long been unoccupied, and the wharfs are for the most part overgrown with grass.

The Dublin and Kingstown railway passes the western dock by a viaduct and raised causeway, and a factory for the repair and supply of locomotive engines is being erected by the proprietors of the railway on the southern side of the same basin. The communication between the Grand Canal docks and the line from James's Street harbour is by a branch canal of about three miles, running from the docks round the south-east and south of the city. The canal is now the property of a company which was incorporated in the year 1772, and who are stated to have spent from time to time on these works a sum of a million and a half sterling. The supply of water for the southern part of the capital is drawn chiefly from the canal.

The main roads subject to turnpikes, which issue from Dublin, are those to Howth, Malahide, Drogheda by Swords, and the Naul, Drogheda by Ashbourn, Ratoath, Navan, and Mullingar, Carlow by Rathcoole and Tallaght. The chief lines free from toll are the military road and the roads to Enniskerry, Bray, and Kingstown.

The only railway at present completed in Ireland is that between Dublin and Kingstown in this county. It is the property of a company incorporated by 1st & 2nd William IV., c. 69, with a capital stock of 200,000*l.*, in shares of 100*l.* each. The line extends from Westland Row, in Dublin, to the jetty opposite the main street of Kingstown, called the Forty-foot road, a distance of nearly six English miles.

The entire line is lighted with gas. The railway bed consists of layers of gravel and concrete, with numerous cross drains. The sleepers are massive blocks of granite, which it was supposed would give unusual solidity to the structure, but the want of elasticity in these supports causes the engines to work harshly. The railway was opened for traffic on the 17th of December, 1834, between which day and the 1st of March, 1836, the number of passengers carried was 1,237,800, being, on the average, 2000 persons daily. Since that period the number of passengers had increased considerably, as appeared by the following statement for the year 1836 of the number of passengers conveyed by the Dublin and Kingstown Railway:—May, 119,000; June, 119,080; July, 146,000; August, 139,000; total, 523,000.

The cost of constructing the railroad and stations, locomotive engines, carriages, &c., and the expenses of obtaining the act of incorporation, amounted, on the 1st of March, 1836, to 237,000*l.*, or upwards of 40,000*l.* per mile, exclusive of 972 yards since added. Of this sum, 75,000*l.* has been advanced as a loan by Government. At the same period the company had realized a net profit of 11,517*l.*, yielding about 8 per cent. per annum on the capital paid by the shareholders.

By act 6th and 7th William IV., c. 132, a company is incorporated for the purpose of making a railway from Dublin to Drogheda. At present the only incorporated railway companies in Ireland are those above mentioned, and the Cave-hill and Ulster Railway Companies. [Down.]

The climate of Dublin is temperate; frosts rarely continue more than a few days, and snow seldom lies. The heaviest fall of snow on record is that which commenced on the 18th of January, 1814, and continued undissolved till the beginning of the next April. The prevailing winds are from the west. The average proportion of winds, as stated by Rutty, is west, south-west, and north-west, to east, south-east, and north-east, as 9061 to 5147. Of 68 storms noted by Rutty, 57 were from the south-west, and but two from the east and north-east. The easterly and north-easterly winds which prevail in spring not being broken by any high grounds, are violent and ungenial. On an average of forty-one years there were in this county—of springs, 6 wet, 22 dry, 13 variable; of summers, 20 wet, 16 dry, 5 variable; of autumns, 11 wet, 11 dry, 19 variable. It also appears by a mean of observations that the dry days in Dublin are to the rainy as 110 to 255. The quantity of rain is, however, by no means as great as at Cork or Belfast. In 1792, one of the wettest years on record, the depth of rain which fell in Dublin was 30.7 inches; of this 5.8 inches fell in the

month of August. The average annual depth of rain which fell in Dublin during the sixteen years preceding the year 1817, was 23 inches 7 lines.

The greater part of the county of Dublin is occupied by a tract of mountain limestone, being a part of the central limestone field of Ireland, which extends from the Atlantic to the Irish sea. This secondary tract extends into Meath on the north, and is bounded in this county on the south by primary rocks. Along the northern coast also there are patches of primitive rock, as the greenstone and argillaceous schists, which form the Man-of-war Hills and the island of Lambay, and the stratified quartz and schist of Howth. Lambay consists of strata of argillaceous schist and greenstone porphyry. The schistose strata are much indurated and contorted. In Howth the stratification is very obvious, and the schistose beds exhibit a great diversity of hues from purple to red. Some of the strata rest on their edges, others are undulated, and sometimes curved upon themselves so as to resemble the concentric crusts of some spheroidal formation (Dr. Scouler). The primitive formation on the south of the limestone plain consists of a ridge of granite supporting flanks of micaceous and argillaceous schists. The granite extends on the south from Dalkey island to Blackrock, and from thence to Dundrum and Rathfarnham; it then takes a southerly direction and crosses the range of the Dublin mountains by the line of the military road; whence, crossing the northern extremity of Glenismael, it extends into the group of the Kippure mountains. On the south it runs from Dalkey to the hill of Killiney, and thence inland by Rochestown hill to the Scalp, whence, holding a southerly course, it passes on to Glencree, in the county of Wicklow, and so southward to a distance of nearly sixty miles, forming the nucleus of the entire range from Killiney to Blackstairs mountain, between the counties of Carlow and Wexford. The granite comprising the greater part of this range is of a coarse texture, and easily disintegrated; in Glenismael particularly, it is frequently found decomposed to a depth of several feet, and hence probably the uniform outline presented by the summits of the range. At Dalkey, however, and generally along the eastern and north-eastern limits of the granite district, the stone quarried is of the closest grain, and excellently adapted to all purposes of building. It is here free from hornblende; the felspar is of a pearly whiteness, and in the stone obtained from the quarries of Kilkenny the mica, instead of occurring in plates, is found in the form of plumose mica.

This mass of granite is almost everywhere in contact with the micaceous schist, both on its western and eastern flanks; and the junction of the rocks may be observed at Killiney, the Scalp, and Rathfarnham. The argillaceous schist approaches it very closely at Ballynascorney; and between Blackrock and Dundrum the edges of the limestone field are in several places within a few yards of the granite, the intervening rocks of the series not being observable. The limestone which elsewhere possesses the usual character of carboniferous limestone, is extremely compact along the margin of the field towards the primitive series, and has a schistose structure (the Calp of Kirwan), which renders it highly useful as a material for building. Dolomite, or magnesian limestone, occurs near the junction of the primary and secondary strata, at Sutton on Howth. Magnesian limestone also occurs on the Dodder, near Milltown. It dresses with peculiar sharpness under the hammer or chisel, and is the material of some beautiful specimens of building; among others, of the Lord-Lieutenant's chapel in the castle of Dublin.

The only mines at present worked (and that but partially, in the county of Dublin, are the lead mines at Ballycorus) within half a mile of the Scalp. Galena, potters' clay, and manganese have been found on Howth. Fuller's earth of a middling quality has been found at Castleknock, on the north bank of the Liffey.

The soil of Dublin abounds in mineral springs: of those within the city, ten were analysed about the year 1750: they are all saline purgative springs, and some of them so strongly impregnated as to yield on evaporation from three to four hundred grains of salts per gallon: of some of those salts two drachms operated as a brisk cathartic. In 1758 a spring strongly impregnated with sulphureted hydrogen gas was discovered in the vicinity of a disused chalybeate spa at Lucan, on the south bank of the Liffey. These waters have been found very efficacious in cutaneous diseases.

There are tepid springs near Finglass and Leixlip; the heat is 75½ degrees Fahr. In general the water, which rises from the Calp district around Dublin, is impregnated with a considerable portion of sulphate or nitrate of lime, which renders it unfit for most domestic purposes, unless with the use of large quantities of soda. It deposits a copious sediment on the vessels in which it is used; and in one distillery mentioned by Whitelaw an incrustation of sienite half an inch in thickness, had frequently to be cleared from the inside of the boilers.

The vegetable soil of the county of Dublin is generally shallow. On the granite bottom it is a light gravel, which requires strong manuring. The subsoil of the Calp district is a tenacious clay, which retains the water and renders the loamy soil wet and cold; but drainage and an unlimited supply of scavengers' manure from the city have brought that part of this district, which lies immediately round the capital, into a good state of productiveness. The quality of the land improves towards the west and north, and the district bordering on Meath is not inferior to the generality of wheat lands in the midland counties. The soil along the junction of the northern primary strata and the limestone is also of excellent quality. There is but a small proportion of the county under tillage. Villas, gardens, dairy farms, kitchen gardens, and nurseries occupy the immediate neighbourhood of the capital, and grazing farms and meadow lands extend over the country which is not occupied by demesnes, to a distance of ten and twelve miles beyond those on the west and north. The mode of feeding generally pursued is grazing during summer and hay feeding in winter. Many extensive farmers and resident proprietors however pursue the system of green crops and stall-feeding the year round. The total annual value of the agricultural produce of the county of Dublin has been estimated at 1,145,800*l.*; the rental of proprietors at 343,700*l.* per annum, and the rent paid by them at 3*l.* per acre. The rents paid by land-occupiers vary from 4*l.* and 4*l.* 10*s.* to 10*l.* in the vicinity of the capital.

Dublin County is divided into nine baronies; namely:— I. Balrothery on the north, containing the towns of Balbriggan, population in 1831, 3016; Skerries, population 2,556; Rush, population 2144. II. Nethercross, scattered through the other baronies in seven separate divisions, of which six lie north of the city of Dublin, containing the towns of Swords, population 2537; Lusk, population 925; and Finglass, population 840. III. Coolock, on the north-east of the city of Dublin, containing the towns of Clontarf, population 1309; Baldoyle, population 1009; Howth, population 797; and Glasnevin, population 559. IV. Castleknock, on the north-west of the city of Dublin, containing part of the town of Chapel Izod, total population 1632. V. Newcastle, on the west and south-west of the city of Dublin, containing the towns of Lucan, population 1229; Rathfarnham, population 1572; Crumlin, population 544; and Newcastle, population 3915. VI. Donore, a small barony, embracing a portion of the south-west of the city of Dublin, with a population of 11,153. VII. St. Sepulchre's, a small barony embracing a portion of the south of the city of Dublin, with a population of 13,631. VIII. Uppercross, on the south-west of the city of Dublin, containing the towns of Ranelagh (a suburb of Dublin), population 1999; Rathmines (do.), population 1600; Harold's-cross, population 1101; Milltown, population 673; Rathcoole, population 602; Clondalkin, population 766; Dalkey, population 544; and Ballymore Eustace, in the detached portion of the county, population 841. IX. Half Rathdown, on the south-east of the city of Dublin, containing the towns of Kingstown, population 5756; Blackrock, population 2029; Little Bray, population 1168; Stillorgan, population 650; and Dundrum, population 680.

There is not at present in the county of Dublin any town exercising corporate privileges. Swords and Newcastle each returned two members to the Irish parliament. The county of Dublin, the city of Dublin, and the university of Dublin are each at present represented by two members in the imperial parliament.

The commerce of the county of Dublin, exclusive of the capital and its immediate vicinity, is limited to the small coast trade carried on at Balbriggan, Bray, and the other coast towns. The cotton and stocking manufactures are carried on at Balbriggan with considerable spirit. There are two cotton factories, and numerous establishments for stocking weaving; the Balbriggan hosiery has long held a

high character in the market. Considerable quantities of flour are manufactured in this county. The principal corn-mills are on the Liffey, the Balbriggan river, and the Kimmage brook, on the south-west of Harold's-cross.

In 1835 the number of boats belonging to the county of Dublin, which were employed in the fisheries, was as follows —

Decked vessels, 121; tonnage, 4651; men, 789:—half-decked vessels, 27; tonnage, 265; men, 150:—open sail-boats, 66; men, 297:—row-boats, 65; men, 249; number of fishermen, 1505.

The fishing grounds lie in from 15 to 60 fathoms water between the Dublin coast and the Isle of Man. The fish consist chiefly of turbot, brit, sole, and plaice, which are sent to market daily throughout the year. There is a well-known fishing ground between Rush and Lambay Island, on which cod, ling, haddock, whiting, &c., are taken. Trawling is the mode of fishing generally practised by the decked and half-decked boats. White trout and salmon are taken at the bars of the Bray river and Liffey. Since the withdrawal of bounties the fisheries along the coast, as well as elsewhere in Ireland, have declined.

Table of Population. (Exclusive of the County of the City of Dublin.)

| Date. | How ascertained. | Houses. | Families. | Families chiefly employed in agriculture. | Families chiefly employed in trade, manufactures, and handicraft. | All other families not comprised in the two preceding classes. | Males. | Females. | Total. |
|-------|------------------------------|---------|-----------|---|---|--|--------|----------|----------|
| 1792 | Estimated by Dr. Beaufort | 10,760 | .. | .. | .. | .. | .. | .. | 54,000 |
| 1813 | Under Act of 1812 | 16,633* | .. | .. | .. | .. | .. | .. | 110,437* |
| 1821 | Under Act 55 Geo. III. c. 20 | 20,791 | 33,695 | .. | .. | .. | 71,661 | 78,350 | 150,011 |
| 1831 | Under Act 1 Wm. IV. c. 19 | 23,819 | 31,570 | 10,127 | 8,769 | 12,674 | 82,299 | 93,713 | 176,012 |

* Return incomplete.

The census of 1831, as compared with that of 1821, exhibits an increase of population and houses, and a decrease in the number of families, which, if not arising from some error in the returns, is very remarkable.

The civil history of the county of Dublin is immediately connected with that of the capital. The whole of the fee of the county, with the exception of the estates of the St. Lawrence family, and with the exception, to some extent, of the estates of the families of Barnwall, Lutterel, and Talbot of Malahide, has frequently changed hands since the period of the Reformation. The forfeitures consequent on the rebellion of 1641 extended to 67,142 acres, 2 roods, 26 perches, profitable, and 1666 acres unprofitable, in this county. The amount of forfeitures in the county of Dublin, consequent on the war of the Revolution in 1688, was 34,536 acres profitable, of the then annual value of 16,061*l.* 16*s.*, and of the then total estimated value of 208,796*l.* 18*s.* The families which chiefly suffered by these confiscations were those of Barnwall, Fleming, Plunket, Walsh, Peppard, Archbold, Cruise, Fagan, Hackett, Archer, Sweetman, Dowdall, and Trant.

The Pagan antiquities of the county of Dublin are not numerous. There is a cromlech on the hill of Carrickmoor in Howth. Another cromlech stands to the south of Killynery, on the descent into the vale of Shanganagh; and at Brennanstown, on the Bray road, 6½ miles from Dublin, there is a third, of large dimensions. Dublin is, however, rich in ecclesiastical and military antiquities. The round tower of Clondalkin, 4½ miles from Dublin, on the southern road by Rathcoole, is in better preservation than most other similar edifices in Ireland. The door is at a height of 15 ft. from the ground; the entire height of the tower is 84 ft., and its diameter above the basement 15 ft. The explosion of 260 barrels of gunpowder in the powder-mills in the vicinity, in 1797, did not in the slightest degree injure the round tower. The antiquities at Swords, on the great northern road, 7 miles from Dublin, consist of a palace of the archbishops of Dublin, in ruins, a square steeple of the old church, and a round tower, 73 ft. in height. This tower is also in good preservation, and retains its conical stone capping. At Lusk, on the same road, 4 miles farther north, there is an ancient church with a square steeple, attached to three of the angles of which are round towers with graduated parapets, and at the remaining angle a round tower of greater altitude and superior construction, supposed to be the original building. Between Swords and Baldoy, 5 miles from the capital, is the hamlet of St. Douglagh's, containing one of the most singular stone-roofed churches in Ireland. The entire edifice measured but 48 ft. by 18 ft. It is divided into a rude nave and choir, which communicate by a narrow square-headed doorway, not sufficiently high to admit a full-grown person upright. The entire construction is rude and capricious; the building does not stand due east and west. Some of the arches are altogether nondescript in their shape, and for several of the

recesses and nooks between the roof it is difficult to assign any probable use. It is perhaps the only edifice in the empire which exhibits the square-headed doorway, the Saxon arch, and the trefoil Gothic and lancet window, in such close juxtaposition. Near the church is a consecrated well, inclosed in an octagon building, the interior of which retains some paintings in fresco executed in the beginning of the seventeenth century. In the vicinity of Howth Castle are the ruins of St. Fintan's Church and of the collegiate church and abbey of Howth. On the opposite side of the Bay of Dublin the vicinity of Dalkey exhibits the remains of an antient town erected here at an early period for the protection of the shipping and merchandize of the capital, to which the creek of Bullock served for a length of time as port. There are also some druidical remains on the commons of Dalkey. The castles of Clontarf, Baldongan, Naul, and Castleknock are among the principal detached military edifices.

In 1821 the number of young persons in the schools of this county, exclusive of the county of the city of Dublin, was 9442, being nearly in the proportion of 6 per cent. of the entire population under instruction. The proportion of young persons under daily instruction in the diocese of Dublin, in 1834, was 7.28 per cent., in which respect the diocese, which may be taken as an index of the county, ranks nineteenth among the thirty-two dioceses of Ireland.

The grand jury presentments for the county of Dublin average about 18,000*l.* per annum. The circumstance of so many of the roads in the county being under the control of turnpike-trustees renders this assessment comparatively light in proportion to the extent of the district on which it is levied.

The constabulary force of the county, on the 1st of January, 1836, consisted of 1 stipendiary magistrate, 5 chief constables of the first class, 1 do. of the second class, 29 constables, 113 sub-constables, and 6 horse. The expense of maintaining this force for the year 1835 was 6129*l.* 16*s.* 7*d.*, of which 2890*l.* 7*s.* 2*d.* was chargeable against the county. The county of Dublin, together with the county of the city of Dublin, the county of the town of Drogheda, and the counties of Meath, Louth, and Wicklow, contribute, in proportion to their relative populations, to the support of the Richmond Lunatic Asylum, built in Dublin in 1815. The fever hospitals and dispensaries throughout the county are supported by equal voluntary contributions and grand jury presentments.

A survey of the county of Dublin, on a scale of 3 inches to the mile, was made by order of the grand jury in 1821. A survey on a scale of not quite 6 inches to 3 English miles had been published in 1760 by John Rocque. A chart of Dublin, by Seale and Richards, was published in 1765, and another has since been published by Captain Bligh. An interesting account of the chief localities of this county is contained in Brewer's 'Beauties of Ireland,' London, 1825. The 'Statistical Survey of Dublin County,' published by

the Royal Dublin Society in 1801, is extremely meagre; and there is not at present any published work on the topography or statistics of the county at all adequate to the importance of the subject. A 'History of the Archbishops of Dublin,' comprising a topographical and statistical survey of the county, by Mr. D'Alton, a writer of considerable reputation, has been stated to be ready for the press, but is not yet published.

DUBLIN, the chief city of Ireland, forming by itself a county of a city, on both sides of the river Liffey, at its entrance into the bay of Dublin. Lat. of Dublin Castle $53^{\circ} 20' 39''$ N.; long. $6^{\circ} 17' 29''$ W. The situation, as considered with reference to the whole of the United Kingdom, is central, there being more places of importance in Great Britain and Ireland accessible in a given time from Dublin than from either London or Edinburgh.

With regard to its boundaries, Dublin may be considered either as a county of a city with separate corporate jurisdiction; or as a city having a local police, and returning representatives to parliament; or as a city consisting of a collection of continuous buildings. In each character its boundaries are different.

Pending the publication of the Ordnance Survey map of Dublin, the areas contained in these various limits cannot be accurately stated. The map constructed by order of the grand jury of the county of the city in 1821 gives the area contained within the limits of corporate jurisdiction at 5217 Irish or 8450 statute acres; the Report of the Boundary Commissioners states that of the city, as limited for the purposes of the elective franchise, at 3538 statute acres; and the Rev. Mr. Whitelaw in 1805 estimated the entire area then occupied by buildings at 1264 statute acres.

Dublin appears to have been known by something approaching nearly to its present name in the second century, as it is found written Eblana in the geography of Ptolemy. The name is written in historical documents Dublin, Dyflin, Dyrelin, &c., being all varieties of the Irish *Dubh-linn*, or *Black-pool*, which appears to be the true etymology. It is also called, and is still generally known among the Irish, by the name *Ath-cliaith*, which may be rendered *Hurdle-ford*, from the causeway laid on hurdles which formerly led to the channel of the river across the ooze at either side.

In the various political contests that have afflicted Ireland from the earliest history of the country Dublin has always borne a conspicuous part; but these events belong rather to the general history than to that of the city. [IRELAND.] Dublin, however, under all circumstances, continued to maintain and increase its importance and its extent. In 1205 the castle was ordered to be built and the city to be fortified; and in 1215 a stone bridge was built over the Liffey. In 1316 the first material extension of Dublin took place in consequence of the pulling down of some of the old walls, and the erection of a new line of defence by the citizens when threatened with a siege by Edward Bruce. The Reformation had commenced in Dublin, in 1535, by the consecration of George Brown, a denier of the papal supremacy, to the archbishopric. In 1550, on Easter Sunday, the liturgy was read in English, for the first time, in Christ Church, and printed, the next year, by Humphrey Powell: this is supposed to have been the first book printed in Ireland. The foundation of the great Protestant University of Trinity College followed close on the establishment of the Reformation. In consideration of the leading part it had taken at the Restoration, the city of Dublin was honoured by the king with a collar of S.S., and the mayor was soon after (1665) invested with the title of Lord Mayor, together with an estate of 500*l.* per annum towards maintaining that dignity. After the struggles immediately preceding and following the Revolution of 1688, on the settlement of affairs by the public cancelling of all the arbitrary proceedings of the abdicated government, October 2, 1695, the improvement of the city was resumed, and from this till the period of the Union the increase of Dublin proceeded with great rapidity.

Although Dublin has decidedly fallen off as an emporium of trade and a centre of society since the act of Union removed the seat of legislation to London, it has, during the last period, not only increased in size and population to a great extent, but continues to advance in architectural improvement.

Stephen's Green, Merrion, Rutland and Mountjoy squares, with almost all the streets on the north-east of

the river, were built round during the period between the middle of the 18th century and the Union. Fitzwilliam-square and the adjoining streets, which are at present among the most fashionable places of residence in Dublin, have been completed since, and a great extension has taken place in private residences towards the south-east; a considerable portion of the north-east of the city also belongs to this period.

The use of brick and stone in private buildings was not general until after the Restoration; and there are now few or no remains of private dwellings of so early a date. The walls almost entirely disappeared in the extension of the city in the 18th century. Christ Church and St. Patrick's are the chief objects of antiquarian interest. The Castle, although occupying a very ancient site, contains but a small portion of the original building. The Tholsel and old courts of law have disappeared, and the oldest of the bridges now standing is Barrack Bridge, occupying the site of a wooden bridge built so late as 1671.

The corporation of Dublin consists of the Lord Mayor, two Sheriffs, 24 Aldermen, and 144 Common Councilmen, made up of 48 Sheriffs' Peers and 96 Representatives of the Guilds. There are 25 Guilds, of which Trinity Guild, or the Guild of Merchants, is the most important, returning 31 of the 96 representatives of the whole. The number of freemen is not correctly ascertained, but is supposed to be about 4000. The chief officers of the corporation are the recorder, coroners, president of the court of conscience, and the governors and keepers of the several prisons. This corporation is subject to the New Rules of the 25th Charles II., modified by the provisions of the 33rd George II., c. 16. The corporation has for upwards of two centuries maintained a strict Protestant character; and the exclusion of numerous wealthy merchants of the Roman Catholic religion, or of what are termed liberal principles, has rendered it comparatively inefficient as a municipal body.

The jurisdiction of the corporate magistrates of the county of the city extends over the various liberties within the Circular Road, although these are situated within the county of Dublin. They are not however permitted to sit at sessions of the peace for the county. The court of quarter sessions of the peace for the county of the city, at which the recorder, lord mayor, and two aldermen preside, has, by the 48th George III., c. 140, a criminal jurisdiction extended to all crimes and offences, excepting high-treason, committed on or within the Circular Road; and by its sittings and adjournments affords 12 gaol deliveries each year. The trial of serious offences is generally reserved for the commission court for the county of the city, held before two judges of the superior courts, with whom the lord mayor is joined in commission. The lord mayor holds a weekly court for the determination of small claims of wages, and the infliction of fines for infringement of municipal regulations: the operation of this court is not considered efficient.

The chief civil jurisdiction of the corporation is exercised in the lord mayor and sheriffs' court, which is held once every three months, with a cognizance of all actions for sums exceeding 40*s.* late Irish currency. The recorder's civil bill court for the recovery of debts over 40*s.* is held quarterly. The court of conscience, for the determining cases between party and party, under 40*s.* Irish, sits every day from 10 o'clock A.M. The practice of these courts is considered open to much improvement, particularly in the adjustment of fees, and the remuneration of certain officers by fixed salaries.

The gaol of the county of the city is Newgate, which is also the gaol for that part of the county of Dublin within the Circular Road. It was founded in 1773, and is situated in Green-street, beside the City Sessions-house, on the north-west of the city. Contiguous to Newgate is the Sheriffs' prison for debtors, erected in 1794. The City Marshalsea is a small prison for debtors committed from the lord mayor's court and court of conscience; the condition of this prison is very wretched. The Smithfield Penitentiary, erected at the charge of government, is a house of correction for the reception of convicted offenders of both sexes; this prison is well conducted. The males are employed and instructed in weaving; the females in needlework, and in washing for the Sheriffs' prison and the gaol of Newgate. The Richmond Bridewell, another government establishment, is also a house of correction for male and

female convicts. Weaving is the principal employment of the males; those sentenced to hard labour are put to the tread-mill. The prisoners on being discharged are paid one-third of the earnings of their labour. The condition of this bridewell is highly creditable to the authorities. The current expenses of these establishments are defrayed by presentments of the grand jury of the county of the city, and in the year 1833 the gross outlay was 11,763*l*. Besides these, there is the House of Industry, with lunatic asylum, hospitals, &c. attached, which is supported by an annual grant of 20,000*l*. from government.

The Four Courts Marshalsea prison is situated within the city, but is not connected with the corporation. The county gaol of Kilmainham stands beyond the western suburbs, and is one of the most severe places of confinement in Ireland.

The revenues of the corporation arise chiefly from rents, certain dues on shipping for slippage and anchorage, renewal of leases, fines levied by the city authorities, and pipe-water taxes. The rents arise out of four several estates granted to the city at various times.

The gross amount of revenue and loan received by the corporation in the year commencing 29th September, 1833, was 38,346*l*. 13*s*. 2*d*., being equal to the expenditure of the year. The principal item in the expenditure is interest on bond, which amounts to upwards of 14,000*l*. per annum.

The police of Dublin and the surrounding district is regulated by the 48th George III. c. 140, amended by the 5th George IV. c. 102. By these Acts the castle of Dublin, and all places within eight Irish miles thereof, not being within the jurisdiction of the Court of Admiralty, are united into one district, and this district is divided into four divisions. Each of these divisions embraces about a quarter of the city, and extends over the adjoining district to the exterior limit of the jurisdiction. To each is attached a divisional office of police, with an establishment consisting of one barrister, one alderman, and one member of the common council, being the divisional justices for that district. The Castle district is the seat of the head police-officer, to whom the divisional justices of the other districts make weekly reports.

The funds applicable to the expense of the police and watch establishments are derived from various sources, namely, from the watch-tax, from pawnbrokers' licences, from publicans' and other licences, from fines and fees, and from government grants. The total disbursements of the Dublin police establishment for the year ending 31st March, 1834, was 41,548*l*. 3*s*. 6*d*.

The paving, cleansing, and lighting of the city of Dublin are regulated by the 47th George III. (loc. and pers. sess. 2, c. 109), amended by the 54th George III. (loc. and pers. c. 221). The Paving Board is a corporation, and consists of three commissioners appointed by the lord-lieutenant. They derive their income from various assessments and other receipts. The total amount of the receipts of the commissioners for paving, &c., for the year ending 5th January, 1833, was 41,115*l*. 8*s*. 6*d*.; and the total amount of their expenditure was 41,997*l*. 7*s*. 5*d*. The streets in general are Macadamized, the footpaths for the most part flagged, and the curb-stones and crossings of cut granite. The city has been well lighted since 1825 with gas, for the supply of which there are four incorporated companies, the works at three of which are at present in operation.

The supply of water is regulated by a committee of the corporation, entitled the Committee of the Pipe-water Establishment. The pipe-water rent, collected by the corporation, forms a large item in their income.

The commissioners of wide streets are constituted by various Acts of Parliament, of which the earliest is the 31st George III. c. 19, and the latest the 2nd George IV. c. 110. The board consists of twenty-five; the lord mayor and representatives of the city and county for the time being are members. Their funds, since the coal-duty ceased in March, 1832, arise almost solely from the wide-street tax, which produces from 5000*l*. to 5500*l*. per annum; and this is allocated to pay the interest, at 3 per cent., on a loan of 36,895*l*. 6*s*. 5*d*. from the government.

The port and harbour are under the management of the Ballast Board, constituted by 26th George III. c. 19. Their funds arise from taxes on shipping entering the port. The tonnage duties received by the Ballast Board in 1832

amounted to 11,960*l*. 17*s*. 9*d*. In the same year the expenditure of the Ballast Board on the harbour was 7,469*l*. 11*s*. 10*d*., and on the great north wall 160*l*. 13*s*. 5*d*. Upwards of 4000*l*. per annum of the receipts of the board goes to pay the interest on debt.

The supply of fuel is almost wholly by colliers from the opposite coast of England. The colliers which entered the port in 1832 measured 230,878 tons. Turf is retailed for lighting fires, &c., in which mode considerable quantities are used: the supply is furnished from the extensive bogs of Kildare and Westmeath by the boats of the Grand and Royal canals.

The ground on which Dublin stands rises gently from the river towards the north and south-west: the highest ground in the city is at Broadstone harbour, which is 62 feet above the level of high water in the Liffey. The eastern division on the south of the river lies almost wholly without the limits of the ancient city on level ground, the northern part of which has in a great measure been reclaimed from the former bed of the Liffey. Six extensive plots of open ground ornament and ventilate this portion of the city; viz., on the south, the Coburg Gardens and Fitzwilliam-square; on the east, Merrion-square; on the north, the park of Trinity College; on the west, the Castle Gardens; and in the centre, Stephen's Green. Dame-street, which leads from the castle to the university, expands towards its eastern extremity into College Green, from which all the leading lines of communication radiate.

The whole area of College Green on the east is occupied by the front of Trinity College, a rich and dignified pile of building of the Corinthian order, built in 1759, and extending north and south 300 feet, a little in advance of the provost's house, which stands on the eastern side of the entrance into Grafton-street.

Separated from the college by the entrance into Westmoreland and College streets, stands the Bank of Ireland, formerly the Irish house of parliament, founded in 1729, which presents a portico of six Corinthian columns towards College-street, and a semicircular façade with a receding centre of extraordinary magnificence towards College Green. The effect of this combination of grand architectural objects is peculiarly striking. West from College Green, Dame-street consists of uniform and lofty houses, occupied by persons in trade, having the Commercial Buildings, founded in 1796, about midway on the north, and the Royal Exchange, founded in 1769, at its southern extremity.

Of the squares which lie east and south of College Green, Stephen's Green, laid down in 1670, is the first in point of extent as well in Dublin as in the United Kingdom. The area within the railing is a rectangle of 1220 by 970 feet, being somewhat more than 27 statute acres, and is now handsomely laid out, although so late as the year 1818 it was a marshy flat surrounded with a stagnant ditch and mean wall. The surrounding buildings are, however, very unequal.

The eastern division of the city lying north of the Liffey occupies higher ground, and is the airiest and most cheerful part of Dublin. Mountjoy-square and Rutland-square occupy the crest of the hill, and from these respectively the chief lines of communication are Gardiner's-street and Sackville-street, the first leading to the Liffey at the Custom House, the latter to Carlisle Bridge, Westmoreland-street, and College Green. The façade of the Lying-in Hospital and Rotunda Rooms forms a striking termination to Sackville-street on the south.

From Rutland-square Sackville-street extends with a scarcely perceptible descent to Carlisle Bridge, a distance of three-quarters of an English mile. The breadth throughout is 40 yards, and the buildings on each side lofty, and, with few exceptions, uniform. About midway between Carlisle Bridge and the Rotunda stands a fluted Doric column, on a pedestal of large proportions, bearing a colossal statue of Lord Nelson. This monument was erected in 1808. West of Nelson's monument the General Post-Office presents a cut-granite front of 223 ft. to the street. In the centre is a portico of Portland stone.

At the southern extremity of Gardiner's-street the Custom-house occupies a detached plot of ground on the quay leading from Carlisle Bridge to the north wall. This splendid building, founded in 1781, is 375 ft. in length by 205 ft. in depth, and exhibits four decorated fronts of the Doric

order; the columns, &c., being of Portland stone, and the body of the building of cut granite. To the east of the Custom-house are docks and stores, the latter on a very extensive scale, surrounded by a lofty wall. The business of the customs-duties department is however so trifling, that half the accommodation here provided would be amply sufficient.

Between Gardiner and Sackville streets runs Marlborough-street, parallel to each. On the western side of Marlborough-street, about midway between its extremities, stands the Roman Catholic Metropolitan Church, founded in 1816. St. George's Church, the beautiful spire of which is conspicuous from the bay and many parts of the city, occupies the highest ground in this district. It is the most sumptuous of the modern churches of Dublin, from a design by Johnstone, and cost 70,000*l*.

The western division of the city, north of the river, is not intersected by any street of large proportions, and is almost exclusively occupied by dealers, tradesmen, and labourers. The portion of it which lies along the quays and towards the Blue Coat Hospital is however well built and respectably inhabited. The Four Courts, situated on King's Inn Quay in this district, was commenced in 1786, and is a building of great extent and splendour. Westward from the courts of law, the Royal Barracks occupy an elevated site over the river, at the extremity of the city on this side. On the outskirts of this division of the city, from the Royal Barracks north-east, are the Blue Coat Hospital, founded in 1773; the Richmond Bridewell and Penitentiary, and the House of Industry and hospitals attached; the Linen Hall, opened in 1728; and the King's Inns. In the eastern part of the district, near Capel-street, are Newgate, the Sheriff's prison, and the Sessions House for the county of the city.

West of the Royal Barracks is the entrance into the Phoenix Park, a finely-wooded demesne of 1089 Irish or 1759 English acres, containing the vice-regal lodge, and the lodges of the chief and under secretary; the Zoological Society's gardens and establishment; the Royal Military Infirmary; the Hibernian Society's school for the education of the children of soldiers; a powder-magazine and artillery station; and a grand obelisk, erected in commemoration of the victories of the Duke of Wellington. The park was first enclosed and laid down for the recreation of the citizens in the reign of Charles II., and was completed by the Earl of Chesterfield while Lord Lieutenant of Ireland. The greater portion of the lands belonged to the dissolved priory of Kilmainham.

The division of Dublin which lies west from the Castle, on the south side of the Liffey, is the oldest part of the city, and is now almost exclusively occupied by persons in trade, small dealers, and the labouring classes. The Castle of Dublin, at the north-eastern extremity of this district, consists of two handsome quadrangles, surrounded, except on one side, by the apartments of state and the offices of government.

West of the Castle stands Christ's Church Cathedral, a venerable cruciform structure, part of which is of a date anterior to the coming of the English. South from Christ Church, at a distance of rather more than a quarter of a mile, is the Cathedral of St. Patrick, situated at the foot of the declivity, the ridge of which is occupied by the castle and older cathedral. St. Patrick's is an imposing pile, consisting of nave, transepts, and choir, with a chapter-house at the east end. Attached is the antient archiepiscopal palace, now converted to a police barrack, and the deanery house, a commodious residence built in the last century. At the back of the old palace is the library founded by Archbishop Marsh in 1694. On the south of this division are a penitentiary, the Portobello barracks, and several hospitals; and on the west, towards Island Bridge, these extensive establishments,—the Royal Hospital of Kilmainham, built at the cost of the army in 1684; the Foundling Hospital; Swift's hospital for lunatics; Stephens's hospital; Kilmainham gaol and the county court-house, and the artillery barracks at Island Bridge.

The Liffey is quayed in throughout its entire length, and crossed by eight bridges, five of which are executed in cut stone, and two in metal. These quays give a great air of magnificence to the views up and down the river.

The condition of the poorer classes in Dublin is wretched in the extreme; yet there are few cities in which charitable institutions are more numerous or better supported. The

number of persons totally destitute is estimated at 25,000; of labouring persons who, getting only occasional employment, are frequently in a destitute state, at 25,000; and of poor tradesmen, frequently in the same condition from want of employment and other causes, at 18,000.

The principal charitable institutions of Dublin are the following:—Association for the suppression of Mendicity; Society for the relief of Sick and Indigent Room-keepers; the Strangers' Friend Society; the Benevolent Strangers' Friend Society; the Charitable Association; Society for the Relief of the Industrious Poor; Sir Patrick Dunn's Hospital, Meath Hospital and County Infirmary, Jervis-street Infirmary, Mercers' Hospital, Maison de Santé (these five are general hospitals for the poor); Simps'n's Hospital (for lame and gouty poor); Lying-in Hospital, Stephens's Hospital (general), Cork-street Fever Hospital, Whitworth Fever Hospital, City of Dublin Hospital (general), United Hospital of St. Mark and St. Ann (general), Hospital for Incurables, Westmoreland Lock Hospital, Hospital of the House of Industry, Lunatic Asylum of the House of Industry, Swift's Hospital (for lunatics). For these charities the total amount of vested estates is 13,262*l*. 19*s*. 4*d*., and the parliamentary and grand jury grants are 30,200*l*.

In addition to these institutions there are six minor lying-in hospitals in the city, numerous houses of relief, and female penitentiaries, and about twelve dispensaries supported by voluntary contributions and local assessment. The number of out-door patients so relieved is very great, probably not less than 50,000 per annum.

The total number of charitable schools in the city of Dublin is 199. Of these 132 are day-schools, 34 are schools where the scholars are lodged, boarded, clothed, &c., 27 are schools for orphans, or in connexion with orphan societies, 4 are schools belonging to societies, and 2 are daily model-schools of the National Board of Education. The total number receiving instruction at these schools is 15,797; the total annual expenditure is about 37,100*l*.

The trade of Dublin consists chiefly in the supply of the midland districts with articles of import. The silk manufacture has long been carried on with considerable success in the production of a superior article, but the trade has latterly declined, and is now very languid. The woollen manufacture was also carried on with good success, but has likewise fallen off of late years. The firm of Messrs. Willans continue to manufacture broadcloths, but this is almost the only house in the trade. The printing of calicoes and muslins has been brought to great perfection by Mr. David Henry, of Island-bridge.

That part of the trade of Dublin which is carried on with the ports of Great Britain has greatly increased since the general adoption of steam-vessels, but there are no means for distinguishing its amount, the intercourse between the two islands having been placed upon the footing of a coasting-trade. The vessels that entered the port from foreign countries during each of the five years from 1832 to 1836, and the amount of their tonnage were as follows:—

| | British. | | Foreign. | | Total. | |
|------|----------|--------|----------|-------|--------|--------|
| | Ships. | Tons. | Ships. | Tons. | Ships. | Tons. |
| 1832 | 210 | 28,302 | 16 | 2,923 | 226 | 41,025 |
| 1833 | 240 | 45,939 | 25 | 6,550 | 275 | 52,489 |
| 1834 | 212 | 36,074 | 27 | 5,456 | 239 | 41,530 |
| 1835 | 201 | 32,439 | 24 | 6,247 | 225 | 38,686 |
| 1836 | 189 | 38,058 | 23 | 5,052 | 212 | 43,110 |

A large proportion of the foreign trade is carried on through Liverpool and Bristol by means of steam-vessels, which convey goods to those ports for shipment.

The amount of customs' duties collected in Dublin in the four years from 1833 to 1836 was:

| | |
|------|----------|
| 1833 | £654,754 |
| 1834 | 768,632 |
| 1835 | 918,801 |
| 1836 | 898,630 |

The tonnage of commodities conveyed upon the Grand Canal and the Royal Canal to and from Dublin exceeds 380,000 tons per annum. The greater part of that which is conveyed to Dublin consists of agricultural produce, cattle, and turf. From Dublin are sent building materials, coals, salt, manure, and general merchandise.

The intercourse between England and Dublin has been much encouraged by the establishment of steam-packets. The number of passengers conveyed by the post-office packets alone, between Dublin and Holyhead and Liverpool, in each of the three years, 1833 to 1835, was as follows:—

| | Between Dublin and Holyhead. | Between Dublin and Liverpool. | Total. |
|----------|------------------------------|-------------------------------|--------|
| 1833 . . | 9,189 . . | 9,292 . . | 18,481 |
| 1834 . . | 11,564 . . | 12,425 . . | 23,989 |
| 1835 . . | 11,558 . . | 14,040 . . | 25,598 |

The population of Dublin has been vaguely ascertained from time to time as follows:—

| A.D. | Houses. | Inhabitants. |
|--------|-------------|--------------|
| 1644 . | No return . | 8,159 |
| 1777 . | 17,151 . | 137,208 |
| 1788 . | 14,327 . | 114,616 |
| 1798 . | 16,401 . | 172,084 |
| 1803 . | 15,958 . | 109,528 |
| 1804 . | 16,234 . | 172,042 |
| 1813 . | 15,104 . | 176,610 |

and with great precision in 1821 and 1831; viz.—

| | 1821. | | 1831. | |
|--|---------|------------|------------|------------|
| | Houses. | Population | Houses. | Population |
| County of the city of Dublin, as limited by its ancient boundary | 14,029 | 178,603 | 16,042 | 204,155 |
| Dublin inside the Circular Road | 18,116 | 224,317 | No return. | 232,262 |
| Dublin inside and outside the Circular Road and canals . | 18,567 | 227,335 | No return. | 265,316 |

The classification of the population of the county of the city in the latter year was as follows:—Males, 91,557; females, 112,598; males 20 years of age, 50,234; occupiers employing labourers, 14; do. not employing do., 26; labourers employed in agriculture, 508; employed in manufacture and making manufacturing machinery, 155; employed in retail trade or in handicraft, as masters or workmen, 23,576; capitalists, bankers, professional, and other educated men, 8620; labourers employed in labour not agricultural, 10,820; other males 20 years of age (except servants), 3612; male servants 20 years of age, 2903; do. under 20 years of age, 556; Female servants, 11,572.

The university of Dublin is incorporated as 'the College of the Holy and undivided Trinity near Dublin, founded by the most serene Queen Elizabeth.' The collegiate body consists of a provost, seven senior fellows, one of whom is vice-provost, eighteen junior fellows, seventy scholars, and thirty sizars. The number of students at present on the books is about 2000. The permanent income of the university arises out of landed estates, which produce a rent of 13,846*l.* 2*s.* per annum, exclusive of the provost's separate estate, which produces a rent of 2400*l.* per annum. The income accruing by the class-fees of pupils amounts to about 30,000*l.* per annum, and a large sum is annually drawn in rents of chambers, and fees for commons, &c.

The Royal Dublin Society, incorporated by George II., 1749, occupies the late residence of the Duke of Leinster in Kildare-street. The income of the society arises from subscriptions of members, and an annual parliamentary grant of 5300*l.* Their museum is open to the public twice a week; and their professors deliver public and *gratis* courses of lectures in their several sciences. A considerable number of youths are also instructed gratis in the fine arts in the schools of the society.

The Royal Irish Academy, for promoting the study of science, polite literature, and antiquities, was incorporated in 1786. The funds of the academy are assisted by a parliamentary grant of 300*l.* per annum. The academy house is in Grafton-street, where there is a good library peculiarly rich in ancient Irish MSS.

The Royal Hibernian Academy of painting, sculpture, and architecture, incorporated in 1803, also receives a parliamentary grant of 300*l.* per annum. The academy house in Abbey-street was bestowed on the body by Mr. Johnstone, the distinguished architect; and here there is an annual exhibition of painting and sculpture.

The other chief societies for the promotion of science and general knowledge, which are not incorporated, in Dublin, are the zoological, phrenological, geological, agricultural, horticultural, and Dublin-library societies.

A considerable stimulus has been given to the literary pursuits in Dublin by the establishment from time to time of various periodical works. The newspaper press of Dublin consists of eighteen different papers.

(Harris's *History of the City of Dublin*, Dublin, 1763; Whitelaw and Walsh's *History of the City of Dublin*, London, 1818; Mason's *History of the Cathedral of St. Patrick*; Brewer's *Beauties of Ireland*; *Picture of Dublin*, Curry, Dublin, 1835; *Reports of Commissioners and Parliamentary Papers*.)

DUBNO, the capital of a circle of the same name, the richest and most productive of the subdivisions of the Russian government of Volhynia. It is situated on the Irva, in 50° 25' N. lat., and 25° 40' E. long., and belongs to the prince of Lubomirsky, who takes from it a ducal title as its owner. The Polish nobility of these parts held their 'contracte,' or annual sessions, at Dubno from 1774 till Western Poland was usurped by Russia. Dubno is an extremely irregular town in construction; the streets are narrow, crooked, and unpaved: it contains about 1190 houses, almost wholly of wood, and 5700 inhabitants, among whom are a great many Jews; and has a ducal residence, a Greek abbey of the order of St. Basil, several Greek and Roman Catholic churches, and a grammar-school. The people carry on much traffic in corn, flax, tobacco, fish, and cattle, the produce of the adjacent country, and hold a large fair at Whitsuntide.

DUBOS, JEAN BAPTISTE, was born at Beauvais in the year 1670. He began to study theology, but soon abandoned it for politics. He was employed by M. De Torcy, minister of foreign affairs, on several secret negotiations, and on account of his talents was rewarded by a pension. Having retired from his political avocations, he devoted himself entirely to literature, and the merit of his works was sufficient to procure his admission into the Académie. He died at Paris in 1742, after a long illness.

The work by which he is chiefly known, '*Réflexions Critiques sur la Poésie et sur la Peinture*,' is excellent. He first inquires into the cause of the fine arts, and discovers it in the love of excitement which is naturally implanted in the human breast: man, he thinks, would rather be unpleasantly excited than not excited at all. He then proceeds to the cause of the pleasure felt in witnessing tragical representations. He observes that, from the before-named love of excitement, people are fond of looking at executions, &c., and then remarks that, when the excitement caused by the contemplation of a real scene of misery has subsided, it is followed by the unpleasant reflection that one of our fellow-creatures has been suffering intensely. Hence a method should be devised by which we may have the excitement without the painful reflection. This end is accomplished by tragedy or a tragical picture, where the suffering, being feigned, leaves behind no feeling of regret. Keeping this principle in view, he goes on to inquire what are the proper subjects for poetry and painting, using as the standard of his judgment the greater or less degree of excitement occasioned by such and such subjects. His discussions whether the hero of a tragedy should be a person of ancient or modern history, on the appropriate use of allegories, and similar topics, are managed in the pleasantest style possible, and are besides, if we make due allowance for the French dramatic prejudices, very instructive, as well for the critical views which they contain as for the historical anecdotes with which they are illustrated. Dubos is also known as an historian by his '*Histoire de la Ligue de Cambrai*,' and '*De l'Etablissement de la Monarchie Française dans les Gaules*,' works which were admired by some of his contemporaries, and slighted by others.

DUCAREL, ANDREW COLTEE, an eminent English antiquary, was born in 1713, in Normandy, whence his father, who was descended from an ancient family at Caen in that province, came to England soon after the birth of his second son James, and resided at Greenwich. In 1729, whilst a scholar at Eton, he was for three months under the care of Sir Hans Sloane, on account of an accident which deprived him of the sight of one eye. In 1731 he was admitted a gentleman-commoner of St. John's College, Oxford; B.C.L. 1738; LL.D. 1742; and became a member of Doctors' Commons in 1743. He was elected commissary of the exempt jurisdiction of the collegiate church of St. Katharine, near the Tower of London, in 1755, and was appointed commissary and official of the city and diocese of Canterbury by Archbishop Herring in 1758. Upon the incorporation of the Society of Antiquaries, in 1755, he was appointed one of its first fellows.

His earliest publication (without his name) was '*A Tour*

through Normandy, described in a Letter to a Friend,' published in 1754, in 4to., enlarged and republished in folio in 1767, under the title of 'Anglo-Norman Antiquities, considered in a Tour through part of Normandy, by Dr. Ducarel, illustrated with twenty-seven plates.' His second publication was 'A Series of above two hundred Anglo-Gallic, or Norman and Aquitain Coins of the antient Kings of England, exhibited in sixteen copper-plates, and illustrated in twelve Letters, addressed to the Society of Antiquaries of London and several of its Members,' 4to., London, 1757. His portrait, engraved by Perry from a painting by A. Soldi, 1746, was first prefixed to this work, which was the result of his acquaintance with M. de Boze, keeper of the French king's medals. In 1760 he printed for private distribution, in 4to., an account of his friend Browne Willis, read at the Society of Antiquaries that year. In 1763 he published 'A Repertory of the Endowments of Vicarages in the diocese of Canterbury,' in 4to., which was reprinted with large additions, in 8vo., in 1782, with the further addition of a repertory of endowments of vicarages in the diocese of Rochester. Dr. Ducarel gave a manuscript abstract of the large history of the Benedictine Abbey of Bec, in Normandy, drawn up by Dom John Bourget, a monk of that house, to Mr. John Nichols, who printed it in 1779, in 8vo., with an appendix of original deeds; and who likewise printed in the same year, in 2 vols. 8vo., 'Some Account of the Alien Priories, and of such lands as they are known to have possessed in England and Wales,' the chief materials of which were also collected by Dr. Ducarel. The greater part of the materials of the 'Collection of Royal and Noble Wills,' from the Conqueror to Henry VII., printed by Mr. Nichols in 1780, were likewise furnished by Dr. Ducarel.

In 1782 he published 'The History of the Collegiate Church of St. Katharine, near the Tower of London, from its Foundation in 1273.' This work had been compiled by the doctor for the use of Queen Charlotte, this church being the only ecclesiastical preferment in the gift of the queen consort of England. An appendix to this work was published in 1790, in No. LII. of Mr. Nichols's 'Bibliotheca Topographica Britannica.'

In 1783 he published, as No. XII. of the 'Bibliotheca Topographica Britannica,' 'Some Account of the Town, Church, and Archbishopal Palace of Croydon, in the County of Surrey, from its Foundation to 1783,' 4to., originally drawn up by him in 1754 at the request of Archbishop Herring. He also drew up in the 'Bibliotheca Topographica Britannica,' No. XXVII., 'The History and Antiquities of the Archbishopal Palace of Lambeth, from its Foundation to the Present Time,' 1785, 4to. dedicated to Archbishop Moore.

Dr. Ducarel's life was one of indefatigable industry. Exclusive of the works already mentioned, the publication of Snelling's plates of English medals originated with him. He wrote in the 'Philosophical Transactions' upon the subject of trees indigenous to Great Britain, followed by an account of the early cultivation of botany in England. His letter to Gerard Meerman, grand pensionary at the Hague, on the dispute concerning Corsellis as the first printer in England, translated into Latin by Dr. Musgrave, with Meerman's answer, was published in the second volume of Meerman's 'Origines Typographicæ' in 1765. He entered deeply into the Rowleian controversy, of which he entertained what is now the general opinion. He completed a list of various editions of the Bible and parts thereof, in English, from 1526 to 1776, an improved edition of which was published in 1778 at the expense of Archbishop Cornwallis. His memoirs of Archbishop Hutton and his family, fairly written, were purchased, at the sale of his library, by Dr. Lort for the Hutton family. He perfected the catalogues of the different portions of the Lambeth library, and made a general index to all the archiepiscopal registers at Lambeth, from Pecham to Herring, in forty-eight volumes in folio, his own duplicate of which was bought at the sale of the late Mr. Gough's library, for the MS. department of the British Museum. In addition to all these literary labours, his official attendance to the duties of Doctors' Commons was unremitting.

Dr. Ducarel died at his house at South Lambeth, May 29th, 1785. The immediate cause of the disorder which carried him off was a sudden surprise, on receiving, whilst at Canterbury, a letter informing him that Mrs. Ducarel was at the point of death. He was buried in his favourite church of St. Katharine, near the altar, in a vault which

he had long before selected for that purpose. (Nichols's *Literary Anecdotes*, vol. vi. p. 380—404; Chalmers's *Biogr. Dict.* vol. xii. p. 375—385.)

DUCAT, DUCATOON. [MONEY.]

DUCIS, JEAN FRANÇOIS, was born at Versailles in 1732, and became a dramatic writer somewhat late in life. His first pieces made but little impression, and it was not until he had produced a version of Shakspeare's 'Hamlet' that his name began to acquire some celebrity. 'Romeo and Juliet,' the second tragedy from Shakspeare, had great success. But Ducis has so altered the works of our great author, that were it not for the name we should with difficulty discover any connexion between the original and the version. He subsequently tried to imitate the Greek drama in a tragedy called 'Œdipus with Admetus,' but he soon returned to Shakspeare, and wrote, among other pieces, 'Macbeth,' 'Othello,' and 'Lear.' In 1778 he was called to the Académie to fill the vacancy left by Voltaire. He afterwards became secretary to Louis XVIII., and was ever most devotedly attached to him. Even when almost starving, he refused a pension of 40,000 francs and the cross of the legion of honour, which were offered him by Napoleon. The restoration of his beloved king rendered his old age happy. At his first audience the king recited to him some of his own verses: 'I am more fortunate,' cried the old poet in ecstasy, than Boileau or Racine; they recited their verses to Louis XIV., but my king recites my verses to me.' He died in 1816.

DUCKBILL. [ORNITHORHYNCHUS.]

DUCKS, ANATINÆ, a subfamily of the *Anatidæ*, including the *true ducks* of Swainson only.

The third book of Belon is entitled 'De la Nature des Oyseaux vivants le long des rivières, ayants le pied plat, nommés en Latin *Palmipedes Aves*,' and comprehends all the web-footed birds known to him.

Willughby distinguishes the 'whole-footed birds with shorter legs into such as want the back-toe and such as have it; these latter into such as have all four toes webbed together, and such as have the back-toe loose or separate from the rest; these latter again' he subdivides 'into narrow-billed and broad-billed; the narrow-billed have their bills either hooked at the end, or straighter and sharp-pointed. The hook-billed have their bills either even' or toothed on the sides. Those that have straighter and sharp-pointed bills are either short-winged and divers, called *Douckers* and *Loons*, or long-winged and much upon the wing, called *Gulls*. The broad-billed are divided into the *Goose* kind and the *Duck* kind. The *Duck* kind are either *Sea-ducks* or *Pond-ducks*.' He afterwards, in his section on the *Broad-billed Birds of the Duck kind*, thus treats (chap. i.):—*Of the Duck in general*. 'The *Duck kind* have shorter necks and larger feet in proportion to their bodies than *Geese*: lesser bodies. Howbeit, the biggest in this kind do equal if not exceed the least in that. They have shorter legs than *Geese*, and situate more backward, so that they go waddling; a broader and flatter back, and so a more compressed body; and lastly, a broader and flatter bill. Their tongue is pectinated or toothed on each side, which is common to them with *Geese*.'

'These are of two sorts, either wild or tame. The wild again are of two sorts—1. *Sea-ducks*, which feed mostwhat in salt water, dive much in feeding, have a broader bill (especially the upper part) and bending upwards (to work in the slem), a large hind-toe, and thin (likely for a rudder), a long train, not sharp-pointed. 2. *Pond-ducks*, which haunt plashe, have a streight and narrower bill, a very little hind-toe, a sharp-pointed train, white belly, speckled feathers, black with glittering green in the middle wing, with a white transverse line on either side. For this distinction of *Sea-ducks* and *Pond-ducks* we are beholden to Mr. Johnson.'

Ray divides his '*Palmipedes latirostræ minores, seu Anatinum genus*' into *Anates Marinæ* and *Anates fluviatiles, aquas dulces præcipue frequentantes, Anates exoticæ Brasilienses, and Anates Domesticæ*. Brisson's twenty-fourth order, consisting of birds with four toes, the three anterior being joined together by membranes, the posterior separated, and with a denticulated bill, includes the genera *Harle*, *Oie*, and *Canard* (*Goosanders*, *Geese*, and *Ducks*). This order is placed between that order of birds the arrangement and connexion of whose toes is similar to the modifications of those parts in the twenty-fourth order, but which have a bill without denticulations (*Puffins*, *Petrels*,

Gulls, Terns, &c.), and the twenty-fifth order, which is distinguished by the birds arranged under it having all the toes joined by membranes (the Darters, Boobies, Pelicans, &c.)

Linnaeus, under his third class of birds, *Anseres*, included the genera *Anas*, *Mergus*, *Alca*, *Procellaria*, *Diomedea*, *Pelecanus*, *Plotus*, *Phaeton*, *Colymbus*, *Larus*, *Sterna*, and *Rynchops*; in short, all those birds which possess a rather blunt bill, covered with an epidermis, gibbous at the base, dilated at the apex, and with denticulated fauces, a fleshy tongue, and palmated natatorial feet. The class stands between the *Ficæ* and the *Grallæ*. The genus *Anas* comprehends the swans, the geese, and all the ducks, in the general acceptance of the term.

Pennant's twenty-fourth genus, *Duck*, is placed between the genus *Merganser* (Goosander) and the genus *Corvoraunt*; and it comprehends the swans, the geese, and all the ducks, like the Linnean genus *Anas*.

Latham, who divides the birds into *terrestrial* and *aquatic*, makes his ninth order, *Palmipedes*, consist of two great sections: the first consisting of those with long feet—Avoset and Flamingo for example,—and the second of those with short feet, comprehending all the short-limbed aquatic birds with webbed feet.

Lacépède's second subclass of birds consists of those the lower part of whose legs is denuded of feathers, or have many toes united by a membrane. The first division of this subclass consists of those which have three anterior toes and one posterior toe, or none. The first subdivision consists of the *Water Birds*, *Oiseaux d'Eau*; and the twenty-third order of Lacépède comprehends those genera which have a denticulated bill, viz., *Canard*, *Anas*; *Harle*, *Mergus*; *Prion*, *Prion*. The genus *Anas* consists of all the birds which combine with the characters above stated a wide bill, rounded at its extremity, and furnished around the mandibles with small vertical laminae.

Duméril (*Zoologie Analytique*, 1806) divided the birds into six orders. The last of these is formed by the *Palmipèdes*; and the first family of that order, the *Serrirostres* or *Prionoramphes*, contains the genera *Canard*, *Harle*, and *Flamman* (Flamingo).

Meyer's ninth and last order, *Natatores*, contains three sub-orders; the second of these, *Lamelloso-dentati*, includes *Cygnus*, *Anas*, *Anser*, and *Mergus* (1810).

Illiger (1811) made the *Natatores* his seventh and last order, and the *Lamelloso-dentati*, the third section, comprehends the genera *Anas*, *Anser* (Brisson), and *Mergus*.

Cuvier's sixth and last order is the *Palmipèdes*; and the last family of that order, *Lamellirostres*, contains the great genus *Des Canards* (*Anas*, Linn.). Cuvier remarks that they are commonly divided into three subgenera, the limits of each of which are not very precise, viz., the swans (*Cygnus*, Meyer), the geese (*Anser*, Brisson), and the ducks, in the general acceptance of the term (*Anas*, Meyer). The other great genus of Cuvier's *Lamellirostres* is *Mergus*, Linn.

Cuvier separates the genus *Anas* into two divisions. The first consists of those whose hind toe is bordered by a membrane, whose head is larger and neck shorter in comparison, and which have also the feet placed more backwards, the wings smaller, the tail stiffer, the tarsi more compressed, the toes longer, and the webs more entire. They walk badly, live more exclusively upon fishes and insects, and dive more frequently. (*Platypus*, Brehm; *Hydrobates*, Temminck; *Fuligula*, Charles Bonaparte.) This first division contains the following subdivisions: *Les Macreuses* (*Oidemia* Fleming, *Anas nigra*, *A. fusca*, Linn., &c.); *Les Garrots* (*Clangula*, Leach; *Anas glacialis*, *A. histrionica*, Linn., &c.); *Les Eiders*, Eider ducks, *Somateria*, Leach, *Anas mollissima*, Linn.; *Les Milouins*, *Fuligula*, Leach.

The second division is formed by those ducks which are without the membranous border on the hind toe, and have the head smaller, the feet less, the neck longer, the bill more equal, and the body less clumsy (épais). These walk better, and seek aquatic plants and their seeds as much as fish and other animals. It would seem, adds Cuvier, that the swellings of their tracheæ are of a homogeneous bony and cartilaginous substance. It is to this division that Charles Lucian Bonaparte, prince of Musignano, confines the appellation *Anas*. The following are the subdivisions: *Les Souchets*, *Rhynchaspis*, Leach; *Les Tadornes*, *Anas tadorna*, Linn., &c.; those which have naked parts about the head, and often a boss or convexity on the base of the

bill, as the Muscovy duck; those with a pointed tail, *Anas acuta*, Linn., for instance; those whose male has curled feathers in the tail, as the wild duck, *Boschas*, *Anas Boschas*, Linn.; those which have a tuft on the head and the bill rather narrower anteriorly, as the Summer duck, *Anas sponsa*, Linu., and the Mandarin duck, *Anas galerriculata*, Linn., *Dendronessa*, Swainson; those which have the bills of ducks, but legs even longer than those of the geese, and which perch and nestle in trees, *Anas arborea*, Linn., &c. One of these Cuvier observes has the feet only semipalmated, *Anas semipalmata*, Latham. Finally, Cuvier goes on to state that we possess, especially in winter, among those which have nothing remarkable about them, *Anas strepera*, Linn., *A. Penelope*, Linn.; and many small species which are distinguished by the name of *Sarcelles*, *Teals*, *Anas querquedula*, Linn., the common Teal, for example.

Vieillot's fifth and last order is again denominated *Natatores*: it consists of three tribes, viz., the *Téléopodes*, the *Atéléopodes*, and the *Philoptères* (*Philopteri*). The third family of the *Téléopodes*, the *Dermorhynques*, contains the genera *Harle*, *Oie*, *Cygne*, and *Canard*; and this family is placed between the *Divers* (*Plongeurs*) and the *Pélagiens*, consisting of the gulls, terns, &c.

The *Palmipèdes* form M. Temminck's fifteenth order, which contains the whole of the true web-footed birds. The genera are numerous, and, among them, the duck (*Canard*) and the goosander (*Mergus*) are placed between the albatros and the pelican (1815 and 1820).

M. de Blainville (1815, 1821, 1822) divides *Natatores* or Swimmers into the *Macroptères* (*Mouettes*), *Syphonorhyniens* (*Petrels*), *Cryptorhyniens* (*Pelicans*), and *Colymbiens*. The latter he subdivides into the *Ailés* (*Canards*), *Sub-Ailés* (*Plongeurs*); and *In-Ailés* (*Manchots*, Penguins).

Mr. Vigora, in his paper 'On the natural Affinities that connect the Orders and Families of Birds,' read before the Linnean Society, December 3, 1823 (*Trans. Linn. Soc.*, vol. xiv., p. 395), makes his fifth order *Natatores* consist of the families stated in the article *DIVERS* (vol. ix., p. 36). The family of *Anatide* (Leach), to which he leads his readers from the preceding order (*Grallatores*) by means of the connexion between the *Rallidæ* and *Cereopsis*, consists, he observes, of the groups which compose the Linnean genera *Anas* and *Mergus*, and, with respect to the affinities that prevail throughout the families of the order, he remarks that the more extensive subdivisions of the Linnean *Anas* which have been acknowledged by all systematic writers, either under the name of sections or genera, display in conjunction with *Mergus* a regular series of affinities conformable to the principles advanced by him as regulating the order. The first group, he observes, upon which we enter in this first aberrant family of the order, has been formed into a sectional subdivision by M. Temminck, under the denomination of '*Les Oies*;' and with equal significance and more effect has been made into a genus, under the title of *Anser*, by M. Illiger, who therein followed the older naturalists that preceded Linnaeus. These birds retain much of the manners of the *Waders*. They are endowed with considerable facility in walking, are found to swim but seldom, and do not dive at all. In these characters, as well as in other particulars, they correspond with the family of *Laridæ*, which meets them at the other extremity of the circle of *Natatores*.

To this division succeeds *Cereopsis*, Lath., strongly allied to the preceding *Anseres* by its general structure, but still more typical in the family in consequence of the length and nakedness of the *tarsi* above the knee: characters which indicate a greater power of walking, and a greater deficiency in swimming. It joins the third division, or the genuine *Anates*, by means of a group of which *Anas arborea*, Linn., is the representative. This third and most typical group of the family, which accords with M. Temminck's first section of '*Canards proprement dits*,' still approaches more closely to the land birds than the birds which follow: the species swim with ease, and even dive, but the latter faculty they seldom exercise unless when pursued. Their food is also less exclusively marine than that of the succeeding groups, being composed of vegetables, grains, and insects, in addition to fish. This division, consisting of many prominent forms, of which *Anas arborea* before mentioned, *A. tadorna*, *Boschas*, *Clypeata*, *Penelope*, and *Querquedula*, may be considered types, is distinguished from the remainder of the '*Canards proprement dits*' of M. Temminck by the hind toe being entire, or free from the lobed membrane which

is attached to the hind toe of these last. Mr. Vigors proceeds to state that this character of the lobated membrane, which is of considerable importance as pointing out the approach of the birds in which it is found to the more typical oceanic families, prevails in all the remaining groups of the present family. It is strongly conspicuous in *Mergus*, Linn., the next division that appears to follow: and we consequently find that the species of that genus carry the powers of swimming and diving to the greatest extent, making use of their wings also in their progress through the water; and at the same time exhibiting a constrained and embarrassed mode of walking, in consequence of the backward position of the legs. It thus forms the passage to the succeeding family of *Colymbidæ*. In the shape of its bill, which is slender and partially compressed, it exhibits a distinct form in its own family: but still, by means of the bill of an intervening species, *M. albellus*, Linn., which is intermediate in its breadth and depression, it preserves its connexion with the *Anatæ*. 'We hence,' continues Mr. Vigors, 'pass to the fifth and last group of the family which, with the bill of the *Anatæ*, retains most of the characters conspicuous in *Mergus*. The forms most prominent in it, represented by the different Linnæan species *A. ferina*, *clangula*, *histrionica*, and *mollissima*, possess a strongly lobated hind toe; they frequent the ocean for the most part, where they dive with the greatest facility and for a length of time; and they live chiefly on marine animals. Their legs are also thrown behind the equilibrium of their body; and thus also they evince their contiguity to the typical *Natatores*. By means of the group which contains *A. mollissima*, our well known *Eider Duck* and its congeners, where the bill, with an elevated protuberance at the base, approaches that of the *Anas olor*, Linn., we find ourselves brought round to the *Cygnus* of the present day, which forms part of the first division. That genus in like manner deviates partially from the conterminous genus *Anser*, in its legs being thrown more backward, and its consequently greater awkwardness in walking. Here then the affinities are evident which thus establish the perfect return of the series of the *Anatidæ* into itself. Before we leave the family, I must indulge myself in observing a most conspicuous peculiarity which marks the series of affinities among these groups. The long and slender neck observable in the *Grallatores* is preserved in such groups of the *Anatidæ* as are most conterminous to that order, such as *Cygnus*, *Anser*, *Bernicla* and *Cereopsis*, until it is superseded by the short necks of the more oceanic *Anatidæ*, which exhibit all the expansion and capaciousness of throat observable in the typical *Natatores*.'

M. Latreille, in his Method (1825), makes the *Palmipèdes* his seventh and last order; and the *Lamellirostres*, the first of its four families, consist of the genera *Cygnus*, *Oie*, *Anatiquæ*, *Canard*, *Harle*.

The method proposed by M. de Blainville in 1815 and 1821, and developed by M. Lherminier in 1827, places the ducks (*Canards*, *Anas*) between *Pelecanus* and *Podiceps*, in the first sub-class, or that of the *Normal Birds*.

In the Zoological Journal (vol. ii., p. 404, 1825-6), Mr. Vigors gives a disposition of the *Anatidæ* which, as he says, exhibits a slight deviation from that drawn out in his paper on 'the Affinities of Birds,' and adopted by Mr. Stephens in the 'General Zoology.' Mr. Vigors states, in making this second disposition, that he does not think, upon consideration, that the two sub-families of the '*Canards proprement dits*' of M. Temminck can be said to be so far separated from each other as by the intervention of another sub-family: while *Cygnus* appears to hold a separate station of equal rank with the other sub-families. The series of affinity, however, according to Mr. Vigors, remains unaltered: a partial change only taking place in the mode of selecting the types of each sub-family. *Mergus* seems to belong to the fourth sub-family, in his opinion, but to be at the extremity of it; in fact to be ocultant between the families of *Anatidæ* and *Colymbidæ*. The following is the arrangement proposed by Mr. Vigors in the Zoological Journal.

ORDO V. NATATORES, Ill. (Anseres, Linn.)

I. FAM. ANATIDÆ, Leach. (Gen. *Anas Mergus*, Linn.)

Sub-fam. Anserina.

Anser, Briss.; *Bernicla*, Steph.; *Cheniscus*, Brookes's M.M.S.; *Chenoplex*, Steph.; *Plectropterus*, Leach.

Sub-fam. Cereopsina.

Cereopsis, Lath.

Sub-fam. Anatina.

Tadorna, Leach; *Cairina*, Flem.; *Anas*, Auct.; *Dasila*, Leach; *Mareca*, Steph.; *Querquedula*, Ray; *Rhynchaspis*, Leach.

Sub-fam. ?

Clangula, Flem.; *Harelda*, Ray; *Mergus*, Linn. (*Morganser*, Briss.); *Somateria*, Leach; *Oidemia*, Flem.; *Biziura*, Leach.

Sub-fam. Cygnina.

Cygnus, Meyer.

The other four families are—2. *Colymbidæ*, Leach; 3. *Alcadæ*; 4. *Pelecanidæ*, Leach; 5. *Laridæ*, Leach.

Mr. Yarrell in his 'Observations on the Tracheæ of Birds,' read before the Linnean Society, February 6, 1827 (*Linn. Trans.*, vol. xv., p. 378), after speaking of the form of the windpipe, among others of the black swan of New Holland, *Anas atrata*, Linn., and of that of the semipalmated goose, *Anas semipalmata* of Dr. Latham, goes on to remark that the different species of geese considered British present nothing remarkable in their tracheæ, the Egyptian goose alone excepted, the male of which species possesses a bony enlargement at the bottom of its windpipe; and he notices the circumstance that systematic authors seem to agree in placing this bird at the bottom of the list of the geese, where it appears to occupy its proper situation; and observes that, combining as it does some of the characters common to those birds and the true ducks, it becomes a very natural link between them, and he closes his interesting paper with an arrangement of the British species of the latter portion of this family founded upon internal as well as external conformation.

'The first division of true ducks,' says Mr. Yarrell, 'will contain the Shielduck, Muscovy, Wild Duck, Gadwall, Shoveler, Pintail, Wigeon, Bimaculated Duck, Garganey, and Teal, all of which will be found to have the following characters in common. Externally they exhibit considerable length of neck: the wings are also long, reaching to the end of the tail; the tarsi somewhat round; the hind toe free or having no pendent lobe. In habits they may be stated generally as frequenting fresh water, but passing much of their time on land, feeding in ditches and about the shallow edges of pools on aquatic plants, insects, worms, and occasionally fish, taking their food at or near the surface; possessing great powers of flight, but seldom diving unless pursued. Of their internal soft parts, the stomach is in the greatest degree muscular, forming a true gizzard; the intestines long, the cæcal appendages from six to nine inches in length in the larger birds, and decreasing only in proportion to the size of the species. Of the bones it may be observed that the ribs are short, extending but little beyond the line of the posterior edge of the sternum; the keel of the breast-bone deep, affording great extent of surface for the insertion of large and powerful pectoral muscles; the enlargement at the bottom of the trachea in all of them is of bone only. The wild duck may be considered the type of this division.'

Mr. Yarrell then proceeds to state that the *Eider Duck*, *King Duck*, *Velvet Duck*, and *Scoter*, possessing some characters common to the preceding class, and others belonging to that next in succession, appear to supply the link between these two divisions; and he regrets that the extreme rarity of the last-named species had prevented him from making any examination beyond that afforded by the external parts of preserved specimens in collections.

The next division of true ducks, according to Mr. Yarrell, includes in the following order the Red-crested, the Pochard, Ferruginous, Scaup, Tufted, Harlequin, Long-tailed, and Golden-eye; and their general distinctions, he remarks, internal as well as external, compared with those of the birds of the first division, will be found of an opposite character. Externally, they exhibit the neck and wings short, the latter only reaching to the origin of the tail-feathers; the tarsi short and compressed; the hind toe lobated, and an extended web to the inner toe. They frequent the sea, or the deep parts of the fresh-water lakes, and have been called oceanic ducks; they are seldom seen on land, their walk is embarrassed from the backward position of their legs, but they dive constantly and with great facility, taking their prey at various depths below the surface; their food consists of finned and shell-fish, and marine insects, but of little or no

vegetable production; and their powers of flight are moderate. With regard to their soft parts, Mr. Yarrell states that the oesophagus is capable of great dilatation, that the stomach is a muscular gizzard, but that the internal cavity increases in size, the stomachs of the long-tailed duck and golden-eye most resembling the stomach of the mergansers, whilst the intestines and caecal appendages are shorter, the latter diminishing from six inches in the first to four and a half in the tufted duck, three inches in the long-tailed, and but two in the golden-eye. The ribs of the birds of this division, according to the same author, are elongated; the keel of the breast-bone gradually decreases in depth; the position of the wings is more forward, and the legs are placed further back. The tracheæ of these ducks, moreover, are particularly distinguished from those of the others by the enlargement at the bottom of the tube being covered with a delicate membrane, supported by slender portions of bone; the trachea of the red-crested duck is an example of this form, and Mr. Yarrell is of opinion that it may be considered the type of this division.

As the Egyptian goose, continues Mr. Yarrell, has in this arrangement been considered the link between the geese and the first division of the true ducks, from its possessing, with the characters of the former, the bony enlargement of the trachea common to the latter; and the velvet duck, for similar reasons, supplying the link between the two divisions of true ducks, possessing, among other characters, an altered form of the bony enlargement of the trachea of the one, with the lobated toe of the other; so the golden-eye, the last of the series, appears to complete the arrangement by exhibiting some of the characters found in the Mergansers, which are next in succession. The first point of similarity is found by Mr. Yarrell in the elongated feathers of the top of the head, forming a crest; they agree also, he adds, in the shape of the sternum, and a particular extension of its posterior edge, becoming an ensiform process; and this extension of the edge of the breast-bone prevails in the genera *Colymbus*, *Alca*, and *Uria*; and, with the elongation of the ribs observable in all good salt-water divers, seems intended as a protection to the important viscera of the abdomen, and enables them to resist pressure when below the surface. The golden-eye, in the opinion of the same author, is also intermediate in its stomach, intestines, and caecal appendages, the latter being only two inches in length. In the goosander indeed Mr. Yarrell found that these appendages reached three inches; but, as he well observes, the size of the bird being considered, they are reduced on a comparative estimate to less than two; in the red-breasted merganser he found them to measure but one inch, and the swan he states is without any. In the form of its trachea, the golden-eye, it seems, more closely resembles the mergansers than that of any other duck, by the enlargement in the tube, and in the shape of the labyrinth. 'Thus the whole of the numerous species of the *Anatidæ* appear to descend to the more perfect water birds by gradations, but with well-marked divisions throughout.'

C. L. Bonaparte, in his 'Tabella Analytica dei Generi,' (Specchio Comparativo, 1827) makes his 'Ordine' *Anseres* consist of five families: the *Longipennes*; the *Lamello-dentati*; the *Steganopodes*; the *Lobipedes*; and the *Pygopodes*. His 'Famiglia' *Lamelloso-dentati* comprises the two genera *Anas* and *Mergus*, the first of which he characterizes thus—'Becco depresso, ottuso, con denti lamelliformi,' and it comprehends the swans, geese, and ducks in the large meaning of the term.

M. Lesson, in his 'Manual' (1828), makes the *Anatidæ* (*Lamelliostres* of Cuvier) the fifth and last family of the sixth order, *Les Palmipèdes, Natatores* of Illiger and Vieillot. Under the *Anatidæ* he arranges the genera *Cygnus*, Meyer; *Anser*, Brisson, with its subgenera; *Cereopsis*, Latham; *Anas*, Linnæus; and *Mergus*, Linnæus. The genus *Anas* he divides into two sections.

The first section embraces those ducks which have the hind toe (pouce) bordered with a membrane (*Hydrobates* of Temminck), and contains the following subgenera:—1st. *Macreus*, Cuv., *Macreranas* (*Anas fusca*, Linn., *A. nigra*, Linn.). 2nd. *Macroramphus*, *Macroramphus* (*Anas perspicillata*, Linn.). 3rd. *Hydrobates*, *Hydrobates*, Temm. (*Anas lobata*, Shaw.) 4th. *Garrot*, Cuv., *Histrionicus* (*Anas histrionica*, Linn.). 5th. *Eider*, Cuv., *Platypus*, Brehm, (*Anas mollissima*, Linn.). 6th. *Millouin*, Cuv., *Fuligula*, Ray, (*Anas fuligula*, Linn.). 7th. *Micropterus*, *Micropterus* (*Anas brachyptera*, Latham.)

The second section includes those ducks whose hind toe is not bordered by a membrane, and the following subgenera are arranged under it:—8th. *Souchet*, Cuv., *Clypeata* (*Anas clypeata*, Linn.). 9th. *Tadorna*, Cuv., *Tadorna*, Leach, (*Anas tadorna*, Linn.). 10th. *Musquë*, *Moschatus* (*Anas moschata*, Linn.).

The 11th subgenus is formed of the *Canard proprement dit*, *Anas*, and is separated into two subdivisions. 1st. *Les Pilets*, which have the tail pointed or surpassed by the two largest quills; Type: *Le Pilet* (*Anas acuta*, Linn.). 2nd. The true ducks, distinguished by the curled feathers on the upper tail-coverts; Type: (*Anas boschas*.)

The 12th subgenus is the *Canarote*, *Anseranas* (*Anas melanoleuca*, Latham, Cuv.); and the 13th the *Sarcelle*, *Teals*, *Querquedula*, Brisson (*Anas querquedula*, Linn., *Anas crecca*, Linn., &c.)

Mr. Swainson, in his paper 'On those Birds which exhibit the Typical Perfection of the Family of Anatidæ' (*Journal of the Royal Institution of Great Britain*, August, 1831), remarks, that the most superficial observer, on looking to the family of the *Anatidæ*, or ducks, under which he will include the geese and swans, must be struck by the remarkable shape and structure of the bill, totally different from that of all other birds. This, in fact, he adds, is the only group in the aquatic order wherein the bill is very considerably dilated in its breadth, and of a texture unusually soft. In addition to these, a third and a very important character is discerned; the cutting margins of the bill are provided with numerous transverse lamellar plaits, so much developed in some species as to project beyond the bill thus assuming an analogy to the teeth of quadrupeds. This analogy, however, is more imaginary than real, since these appendages are destined for a very different purpose. The feet, although in general short, are adapted to more than one purpose, since they are not only used for swimming and diving, but for walking.

Mr. Swainson proceeds to state that 'the gulls feed indiscriminately upon marine animals, whether living or dead: they are the purifiers of the waters as the vultures are of the land. The pelicans and the penguins derive their support from those large fish which the more feeble gulls can neither capture nor swallow, while the terns skim the ocean in search of small fish which rise to the surface. But the inconceivable multitudes of minute animals which swarm, as voyagers assert, in the northern seas, and the equally numerous profusion inhabiting the sides of rivers and fresh waters, would be without any effectual check upon their increase, but for a family of birds destined more particularly for that purpose. In the structure, accordingly, of the ducks, we see all these qualifications in the utmost perfection. By means of their broad bill, as they feed upon very small and soft substances, they capture at one effort considerable numbers. Strength of substance in this member is unnecessary: the bill is therefore comparatively weak, but great breadth is obviously essential to the nature of their food. As these small insects also which constitute the chief food of the *anatidæ* live principally beneath the surface of the mud, it is clear that the bill should be so formed that the bird should have the power of separating its nourishment from that which would be detrimental to the stomach. The use of the laminae thus becomes apparent: the offensive matter is ejected between their interstices, which, however, are not sufficiently wide to admit the passage of the insect food at the same time. The mouthful of stuff brought from the bottom is, as it were, sifted most effectually by this curiously-shaped bill; the refuse is expelled, but the food is retained. It is probable also that the tongue is materially employed on this process; for unlike that of all other birds, it is remarkably large, thick, and fleshy. From being so highly developed, it must be endowed with an unusual degree of sensation; and indeed, a very exquisite sense of taste must belong to any animal which has to separate its food from extraneous substances, without deriving any assistance in the process from its powers of sight. Against this deficiency nature has wisely provided, by heightening and increasing the senses of taste and touch.'

In the physiological series of the Museum of the Royal College of Surgeons in London—Gallery (317)—is the head of a Muscovy duck, *Anas Moschata*, Linn., showing the serrated character of the margins of the mandibles, and the peculiar tuberosity at the base of the beak; and a good opportunity of studying the structure of the tongue is afforded by the preparations numbered 1468 and 1469. In the fur-

mer are seen the bones of the tongue and upper larynx of a swan (*Cygnus Olor*, Brisson). The glosso-hyal part is broader and longer than it is in the land-birds, corresponding to the greater development of the tongue in the lamellicorn swimming birds, but is devoid of the cartilaginous processes to its posterior angles in the gallinaceous tribe. In the larynx may be distinguished the thyroid, cricoid, and arytenoid cartilages, which in most birds are more or less bony: the thyroid cartilage is the largest, and covers the whole anterior part of the larynx like a shield: the posterior broad part of the cricoid (which is not in this class developed in the form of a ring) supports as usual the arytenoid cartilages which form the *rima glottidis*; they have muscles for opening and closing that fissure, and the larynx is defended by the latter action alone from the entrance of food or fluid. No. 1469 exhibits the lower jaw, with the tongue and larynx of the same bird, and it will be seen that the tongue is so far developed as to correspond with the form of the lower jaw. It is a thick and fleshy organ, beset with four longitudinal rows of horny tooth-like processes, two at the sides, and two on the dorsum, separated by a mesial furrow: the base of the tongue is also armed with retroverted spines arranged in a chevron figure; similar spines again occur behind the larynx. The apo- and cerato-hyal bones are dissected on one side, but covered by the muscles on the other.

Mr. Swainson, in the paper above quoted, divides the genus *Anas* (which he thus characterizes 'Bill longer than the head, depressed nearly its whole length. The base not enlarged, the tip very obtuse; the laminae of the upper mandible generally projecting. Hinder toe not dilated, short: claws short, thick') into the following sub-genera:

1. *Typical Group.* Sub-genera.

Bill spatulate, simple; laminae } ANAS, Lin.
considerably projecting.

2. *Sub-typical Group.*

ing laminae short, slender, acute, } CHAULIODUS, Sw.
crowded.

Bill more cylindrical, length- }
ened; tail long. } DAFILA, Leach.

Bill depressed, of equal breadth; }
laminae distant, obtuse, and gene- } BOSCHAS, Antiq.
rally concealed; tail short.

The type of the genus *Anas* is considered by Mr. Swainson to be the shoveler duck; and he thus speaks of the arrangement above set forth: 'In regard to the tabular disposition of the five sub-genera, or types of form, it will be expected that I should say a few words, since it is at variance with the mode of exhibiting circular affinities adopted by that distinguished writer who first detected this arrangement. On this point I must refer the reader to the ornithological volume of the 'Northern Zoology,' now about to appear, where he will find our peculiar views explained and illustrated. I have, indeed, chosen to enumerate, in both instances, the subordinate divisions of the aberrant group, but they are always viewed by me as forming a distinct circle of their own, the *primary divisions of every natural group being considered as THREE and not FIVE*. In the present instance, the three sub-genera of *Chauliodus*, *Dafila*, and *Boschas*, possess one common character, in not having the bill conspicuously dilated at its extremity; while their circular succession can hardly be questioned, when we find the greatest modern reformers* leave the *Gadwall* and the *Mallard* in the same group; these writers having overlooked the modifications of the laminae, and passed over the difference in the habits of these birds, as not bearing upon the question. The theory that the mallard is the typical representation of this family has now, I trust, been thoroughly investigated, and demonstrated to be erroneous;† nor can I consider the two circular arrangements‡ that have been made of the whole family, each apparently perfect, but essentially different, in any other light. They appear to me to be the result of abstract theory, and of a theory misapplied.

On the other hand, I deem it but justice to the great merits of another ornithologist of our own country to acknowledge the assistance I have derived from his highly valuable paper on the trachea (tracheæ) of birds,* and, at the same time, to declare that if there is any truth in his own inferences, drawn from internal structure, or in mine, resulting from attention to external form and habits, he has himself marked out the true circle of the anatidæ, so far as the British species are concerned, *totally unconscious of having done so*. There is, and there cannot be, but one plan of creation. In our efforts to develop this plan we must, as Mr. Yarrell justly observes, "combine ascertained habits, external characters, and anatomical structure;" and in proportion as we can do this so may we assume that our arrangement is "natural."

We entirely agree with the author above quoted in the praise awarded to Mr. Yarrell; but we hesitate to join in the conclusion that he has 'marked out the true circle of the anatidæ, so far as the British species are concerned, *totally unconscious of having done so*,' an expression repeated also in italics in the second volume of 'Fauna Boreali-Americana.' Mr. Yarrell proposed his method on the combined principles of 'ascertained habits, external characters, and anatomical structure;' and his paper, though it is marked with his usual modesty, shows that he well knew all those principles and their value as elements of arrangement. In addition to this, we have the best authority for stating that Mr. Yarrell had not the want of consciousness attributed to him.

Dr. Richardson ('Fauna Boreali-Americana') observes that the *Anatidæ* are 'of great importance in the fur-countries, as they furnish at certain season in the year, in many extensive districts, almost the only article of food that can be procured. The arrival of the water-fowl marks the commencement of spring, and diffuses as much joy among the wandering hunters of the arctic regions as the harvest or vintage excites in more genial climes. The period of their migration southwards again, in large flocks at the close of summer, is another season of plenty, bountifully granted to the natives, and fitting them for encountering the rigour and privations of a northern winter. The *Anatidæ* have therefore very naturally been observed more attentively than any other family of birds, both by the Indians and white residents of the fur-countries; and as they form the bulk of the specimens that have been transmitted to England, they are also better known to ornithologists.'

Sub-family, ANATINÆ, Swainson. (The true Ducks.)

Geographical Distribution. Dr. Richardson, in the work last quoted, states, that *Anas clypeata* and *A. (Dafila) acuta* frequent chiefly the clear lakes of the northern districts, and breed in the barren grounds, being found in numbers in the more southern woody districts in spring and autumn only. *A. (Boschas) domestica*, *A. (Chauliodus) strepera*, and *Mareca Americana*, breed in the woody districts up to their most northern limits, in latitude 68°. *A. (Boschas) crecca* is abundant to the extremity of the continent, both in the woody and barren districts. *A. (Boschas) discors*, though very plentiful on the Saskatchewan, was not observed farther north than the fifty-eighth parallel; while *Dendro-nessa sponsa* seldom goes to the northward of the fifty-fourth degree of latitude, and is rare even to the southward of that parallel.

It appears also from Dr. Richardson's tables that *Anas Clypeata* was observed in 70° lat. N. migratory across the continent; numerous: that it was observed on the Saskatchewan, in 53° to 54° N. lat., and from 600 to 1000 miles distant from the sea coast, very common as a bird of passage in spring and autumn; that it frequents the vicinity of Philadelphia, rather common in winter (Bonaparte), and that its winter quarters are in the United States and Mexico. *A. (Chauliodus) strepera* has been noticed in 68° N. lat. east of the Rocky Mountains, migratory; and on the Saskatchewan (same range of lat. and same distance from the sea coast) common in summer; rare in the vicinity of Philadelphia in winter (Bonaparte): its winter quarters are the Mexican lakes (Swainson).—*A. (Dafila) candidula* in lat. 70° east of the Rocky Mountains, migratory; very common; and on the Saskatchewan, as above, in spring and autumn, but not rare; common in the vicinity of Philadelphia in winter (Bonaparte); and having its winter quarters in the Mexican lakes (Swainson). *A. (Boschas) domestica* in lat. 68°; migratory across the continent: com-

* Dr. Leach, Dr. Fleming, Stevens (Stephens?), Vigora.

* *Lin. Trans.* xv., p. 372.

mon on the Saskatchewan, as above, in the summer; common in the vicinity of Philadelphia in the winter (Bonaparte); and having its winter quarters in the Middle and Southern States, Columbia R. and California. *A. (Boschas) crecca*, in lat. 70°, migratory across the continent; very abundant; on the Saskatchewan, as above, abundant in summer; very common near Philadelphia in the winter (Bonaparte); and with its winter quarters in the Middle and Southern States towards the tropics. *A. (Boschas) discors*, in lat. 58°, migratory across the continent; very abundant; and on the Saskatchewan, as above, abundant in summer; very common near Philadelphia, in summer (Bonaparte); and with the Mexican States, Columbia R. and California for its winter quarters. *Mareca Americana*, in lat. 68°, migratory; rather common on the Saskatchewan, as above, in summer; common near Philadelphia in the winter (Bonaparte); wintering in the Middle and Southern States and the West Indies. *Dendronessa sponsa*, in lat. 54°, migratory; rare on the Saskatchewan, as above, in summer; common in the vicinity of Philadelphia, in summer (Bonaparte); wintering in the Southern States, Mexico? West Indies.

In the same work we find in the list of species which merely winter in Pennsylvania, and migrate in summer to rear their young in the fur-countries, *Anas clypeata*, *A. (Chauliodus) strepera*, *A. (Dafila) caudacuta*, *A. (Boschas) domestica*, *A. (Boschas) crecca*, and *Mareca Americana*;—in the list of species which summer (or breed) in the fur-countries and in Pennsylvania, but winter farther to the southward, *Anas (Boschas) discors* and *Dendronessa sponsa*;—and in the list of species common to the Old World and the fur-countries, *Anas clypeata*, *A. (Chauliodus) strepera*, *A. (Dafila) acuta*, *A. (Boschas) domestica*, and *A. (Boschas) crecca*.*

Food, Habits, &c.—The *Anatinae* feed on soft substances, such as fresh-water insects and tender aquatic plants, which they procure near the surface, or, aided by the length of their necks, at the bottom, in shallow muddy places, and worms and slugs, which they search for among the grass. By day they resort to small lakes and rivers, and in the night retire to the fields. They are strong and swift on the wing, and are watchful birds, that seldom dive to escape pursuit, unless when moulting; but when disturbed fly away, making at the outset a circle in the air to survey the cause of their alarm. ('Fauna Boreali-Americana.') Dr. Richardson gives in a note the following interesting information derived from an intelligent keeper of a decoy in the neighbourhood of the Rev. W. Booth of Friskney, in Lincolnshire, to whom Dr. Richardson expresses his obligation for the statement:—'Skelton is unacquainted with the habits of the Gadwall; but he tells me that the widgeon and pintail do not willingly dive: of course, if driven to it, they can, but they do not dive for their food; and though in play they sometimes splash under water, they never remain beneath the surface like the pochard. With respect to food: the mallard, pintail, and teal frequent rich flooded lands, "swimming with their heads in the soil, and sucking out its strength;" but the widgeon feeds quite differently, being "an amazing fowl to graze, a strange eater of grass." It is especially fond of "flutter-grass" (*Glyceria aquatica vel fluitans*?) which it crops on the surface, but it likewise eats many other herbs. When the decoy has been so full of widgeons that they have devoured every blade on the landings, Skelton has taken advantage of their absence in the night, when they resort to the green salt marshes on the sea coast, and laid down sods pared from the fields, on which they readily graze. In common, however, with the mallard, teal, and pintail, they are fond of willow-weed, seeds (*Epilobium*?) with which he feeds all the fowl in the decoy, as they prefer it to oats and every other kind of grain.' Mr. Waterton states that 'the widgeon feeds by day, eating grass like a goose; whilst its congener the mallard invariably refuses this food and seeks for its sustenance by night.'

Sub-genera. *Anas*.

Example. *Anas clypeata* (Linn.) The Shoveler.—This is the *Souchet* of the French, *Cucchiarone* of the Italians, *die Schild-Ente*, and *Löffel-Ente* of the Dutch, *Mumenick* of the Cree Indians, *Huryad lydanbig* of the antient British, *Rhynchosaspis clypeata* of Shaw's Zoology (Leach MSS.), *Spathulea clypeata* of Fleming. The *Anas rubens* of

* See also 'Localities' under each genus, and the lists of Col. Sykes and Mr. Keith Abbott, towards the end of the article.

Gmelin is said to be the young male, or a variety of the young male. It is provincially termed *Blue-winged Shoveler*, *Kerlutoch*, and *Broad-bill*.

Bill of Shoveler.

Description of a male killed at Fort Franklin, May, 1826. Colour.—Head, adjoining half of the neck, medial stripe to the interscapulars, the whole back, interior scapulars, and primaries, umber-brown; sides of the head, the neck, and crest, glossed with duck-green; rump and tail coverts above and below, with blackish green. Lower half of the neck, the breast, shoulders, shorter scapulars, ends of the greater coverts, and sides of the rump, white; longer scapulars striped with berlin-blue, white and blackish brown. Lesser coverts berlin-blue. *Speculum* brilliant grass-green, broadly bordered above, and narrowly edged below with white; bounded interiorly with greenish black. Belly and flanks deep orange-brown, the latter undulated posteriorly with black. *Bill* black. *Legs* orange.

Form.—*Bill* a little higher than wide at the base, much depressed, dilated and rounded at the end. Mandibles furnished with long, slender, crowded laminae, the upper ones acute and projecting, forming an apparatus admirably fitted for sifting small insects from the water. Surface of the upper mandible pitted near its oblong unguis. *Wings* scarcely an inch longer than the tail, which is graduated, moderately acute, and consists of 14 acute feathers. *Tarsus* scarcely compressed. Hind-toe not lobed, and the outer-toe shorter than the middle one, as in the rest of the *Anatinae*.

The female is liver-brown above, with broad borders of pale wood-brown; underneath pale wood-brown with obscure liver-brown marks. She wants the dark-brown and green colours of the head, rump, and tail coverts, the white of the neck, breast, sides of the rump, and scapulars, and also the orange-brown of the belly. The lesser coverts are slightly glossed with berlin-blue, and the *speculum* is less vivid than in the male. Length 21 inches 6 lines, &c. (Richardson.) The weight is about 22 ounces.

Temminck states that the young males in autumn, and the old males during their moult, have some of the feathers proper to the winter plumage of the male, and others peculiar to the female, or to the young male before the moult, and that these feathers are indistinctly mingled. Young and old males in the summer change are supposed to be the origin of *The Red-breasted Shoveler*.

The trachea of the male is of equal diameter, excepting towards the lower larynx, where it is very slightly enlarged. It forms a slight bony protuberance on the left side, which is dilated a little below. The bronchiae are very long (Temminck.)

Localities.—Marshes, lakes, and rivers; in Russia, and a great part of Asia. Very abundant in Holland. In France, Germany, and England, it is a bird of passage, arriving in the British islands generally about October, and departing about March. In England the principal resorts of the species are the fens of Lincolnshire and Cambridge. Bonaparte (*Specchio Comparativo*) notes it as one of those birds common to the neighbourhoods of Rome and of Philadelphia, and as being rather common in both places in winter. For its American distribution see *Geographical Distribution*.—According to Latham it inhabits the Coromandel coast and parts of India. The form occurs in Australia (*New Holland Shoveler*); and Swainson says that the geographical distribution of the true Shovelers may be deemed universal.

Food.—Fishes and insects, rarely plants and seeds. (Temminck.)

Propagation.—Nest upon the borders of lakes covered with reeds or coppice. Eggs, twelve to fourteen, of a bright greenish yellow, or oil-green. It is said to have bred in France, and has been known to breed in the marshes of Norfolk, and in the neighbourhood of the Tweed. But these may be deemed exceptions to the general place of nidification, which is far north.

Utility to man.—The flesh is highly esteemed for the table, and is considered by many to excel that of the mallard, or common wild-duck, in flavour.

Shoveler. *Anas clypeata*.

Malacorhynchus (Swainson).

Mr. Swainson ('Journal of the Royal Institution,' loc. cit.) observes that among the broad-billed ducks of the southern hemisphere there is a very remarkable modification of form. The breadth of the bill and the length of the laminae are nearly the same; but the edge of the upper mandible, instead of being smooth, as in the European species, is furnished with a thin membranaceous skin, which projects considerably, and hangs down somewhat like a wattle on each side. Mr. Swainson proposes for this form the sub-generic name above given, remarking that the bill of the European Shoveler is flexible, but that in this group it is much more so. One species, he adds, described by authors under the name of the Soft-billed Shoveler, can scarcely exhibit this debility more than another before him when he wrote his paper: it came, according to him, from the same country (Australia?) and seems to be undescribed.

Bill of *Malacorhynchus*. (Swainson.)

Chauliodus (Swainson).

Mr. Swainson states that the Gadwall certainly makes as near an approach to the Shovelers as any other yet known. 'The form of the bill, indeed, is no longer spatulate, or perceptibly broader towards the end; but the laminae

of the upper mandible are still very fine, distinct, and more numerous than those of any other form subsequently mentioned, for they project a full tenth of an inch beyond the margin. The tail now begins to be lengthened, and, in a new species from Africa (*C. Capensis*), which I have recently received, is so much attenuated, as to evince an evident affinity to the Pintail Duck forming the sub-genus *Dafila* of Dr. Leach.'

Bill of *Chauliodus* (Gadwall). (Swainson.)

Example. *Chauliodus strepera* (Swainson). The Gadwall, or Gray. This is the *Chipeau*, or *Ridenne*, of the French, *Anitra montanara* and *Anatra canapiglia* of the Italians, *Schwatterente* and *grave Mittel-ente* of the Germans, and *Y gors Hwyaad luyd* of the ancient British.

Description of a male killed on the Saskatchewan, May 22, 1827. **Colour.**—Top of the head and nape liver-brown, edged with grey; head beneath and neck, grey, with small brown specks. Base of the neck above and below, anterior part of the back, exterior scapulars, flanks, and sides of the vent, clove-brown, marked with concentric horse-shoe-shaped white lines. Interior scapulars, lesser coverts, primaries, tertiaries, and tail, hair-brown; intermediate coverts chestnut-brown; greater coverts, rump, and upper and under tail-coverts, bluish-black; *speculum* white, its anterior border black. Lower part of the breast, middle of the belly, and under surface of the wings, white. **Bill**, brownish-black, pale beneath. **Legs** orange-coloured.

Form.—**Bill** as long as the head, of equal breadth and height at the rictus; depressed, but not widening anteriorly. Laminae of the mandibles rather stronger and much shorter than those of the Shoveler, but finer and more numerous than those of any northern species. The upper ones project a full tenth of an inch beyond the margin. **Wings** nearly equal to the tail; first and second quills equal and largest. **Tail** consisting of sixteen feathers, the lateral ones graduated. Total length twenty-three inches, &c. (Richardson). Size rather less than that of the wigeon. Temminck makes the length eighteen or nineteen inches. The female has the feathers of the back of a blackish-brown, bordered by bright ruddy (*roux*); the breast reddish-brown, marked with black spots; no zigzags on the flanks; rump and lower coverts of the tail greyish.

Localities.—The marshes, &c., of the north and east of Europe; very abundant in Holland. Rarely seen in the British islands except at the period of its vernal migration, and then generally in the marshes of Norfolk. Common in winter on the maritime coasts of France; rare in the interior. Bonaparte (*Specchio Comparativo*) notes it as rather common in the neighbourhood of Rome in the winter. For its American range see the general *Geographical Distribution*.

Food.—Fishes, molluscs (coquillages), insects, and aquatic plants (Temminck). Insects and their larvae, aquatic plants, and seeds (Selby).

Propagation.—Nest in the most covered part of marshes or rushy meads. Eggs eight or nine, of a greenish ash (Temminck); ten to twelve, of a pale oil-green (Selby).

Utility to man.—Flesh excellent.

N. B. The trachea of the male is slightly enlarged in its diameter at about two-thirds of its length, but becomes narrower as it approaches the lower larynx: this consists of a large bony arch, with a globular, or rather pyriform, bladder attached to the left side, being in shape much like that of the common mallard, but smaller.

Gadwall. *Chaulioides strepera*.

Dafila (Leach).

Bill of Pintail Duck. (Swainson.)

Mr. Swainson observes that nature has now so far receded from the typical form that one of the chief peculiarities of that structure is nearly lost, and another considerably modified. The laminae of the upper mandible, which, in *Chaulioides strepera*, are so much shorter than those of the true Shovelers, and are so much abbreviated in *C. Capensis*, become almost concealed by the margin of the bill in *Dafila*. 'The most striking characteristic therefore of the genus we are now considering,' continues Mr. Swainson, 'has nearly disappeared, precisely in that form which is furthest removed from the type. But the shape of the bill, although essentially modified, has not undergone a total alteration: its breadth towards the tip is not only as great as at the base, but is even more dilated; so that in this respect it resembles the Shovelers more than the Gadwalls, while it differs from both in being higher at its base, considerably more lengthened in proportion, and much more convex throughout. It assumes, in short, a semi-cylindrical form, the end being particularly obtuse and slightly dilated; the precise point of junction between the Pintails and that group which was known to the ancients by the name of *Boschas*.'

Example. *Dafila caudacuta*. *The Pintail Duck*. This is *Le Canard à long Queue* ou *Pilet* of the French; *Anitra codilanza* and *Anatra di coda lunga* of the Italians; *Spießente* and *Fasan Ente* of the Germans; *Aler*, *Ahlvoegel* of the Fauna Suecica; Sea Pheasant, or Cracker, of Willughby; *Keeneego yaway-sheep* of the Chippeway Indians; *Hwyad gynffonfain* of the antient British; *Anas caudacuta* of Ray; *Anas longicauda* of Brisson; *Anas acutus* of Linnaeus; *Querquedula acuta* of Selby.

Description of a male killed on the Saskatchewan, May, 1827. **Colour.**—Head and adjoining part of the neck anteriorly umber-brown, with paler edges; neck above blackish-brown; the whole of the back, shorter scapulars, sides of the breast, and flanks, marked with fine waved transverse lines of brownish white and black, most regular and broadest on the long feathers lying over the thighs: long

scapulars and tertiaries black, the borders of the former and outer webs of the latter white; wing coverts and primaries hair-brown; the primary shafts white, and the interior coverts mottled with the same; *speculum* dark-green, with purple reflections, bounded above by a ferruginous bar and interiorly and below by white. **Tail**, and most of its upper coverts, dark-brown with pale borders. Two long central upper coverts, vent, and under coverts, black; the latter bordered with white. A lateral streak on the upper part of the neck, the sides and front of its lower part, the breast, and belly, white. The posterior part of the abdomen minutely marked with grey. **Bill** black; sides of the upper mandible bluish-grey. **Feet** blackish-grey.

Form.—Bill much lengthened, fully as long as the head, considerably higher than wide at the base; the upper mandible of equal breadth to the point; the *laminae* not projecting beyond the margin. **Wings** two inches shorter than the tail. Scapulars, tertiaries, tail-feathers and their coverts, tapering and acute; the middle pair of tail coverts having long slender points that project two inches and a half beyond the tail. **Tail** graduated. **Tracheal dilatation**, a small osseous sac, the size of a hazel-nut. Total length 26 inches 6 lines (Richardson). Selby observes that the labyrinth of this species consists of a round long bladder, situated on the left side of the arch of the lower larynx; its upper surface being nearly even with the top of the arch, but its lower one reaching much below it. Its texture very fine, and, in young birds, may be indented by slight pressure; but becomes brittle in adults. The weight of the bird is about 24 ounces.

The female is smaller. Forehead and crown pale chestnut-brown, streaked with black. Cheeks and neck pale ochreous yellow, speckled with black. Chin and throat pale cream-yellow. Sides of the breast hair-brown, barred and tipped with white. Mantle and scapulars amber-brown, barred and varied with pale buff-orange and white. Tertiaries hair-brown, margined with white. Lesser and greater wing-coverts pale broccoli-brown, edged and tipped with white. *Speculum* hair-brown, glossed with green, the feathers having white tips. Quills hair-brown. Tail deep hair-brown, with imperfect bars of white and pale buff-orange: the two middle feathers exceeding the rest in length about half an inch. Belly and abdomen yellowish-white, indistinctly marbled with broccoli-brown. Under tail-coverts white, speckled with chestnut-brown of different shades. Bill greyish-black. Legs and toes grey, tinged with brown. (Selby.)

Young Males.—Head red-brown, spotted with black; belly yellowish, and the *speculum* of a green, inclining to olive, without reflections.

Selby remarks, that like many other of the *Anatidae* (particularly of the species belonging to this group), the plumage of the male Pintail, towards the end of summer, or after the sexual intercourse is completed, undergoes a remarkable change, and becomes very like that of the female. This appears to be an actual change of the colour in the feathers rather than a renewal of them; and the same change, he adds, is observable in the mallard, and the males of the Teal, Wigeon, &c. It also prevails, if not in all, at least in some species of the genus *Mergus*, as he noticed it in *Mergus serrator*.

Localities.—The north of Europe and America; very numerous at its double passage in Holland and in France: equally abundant in Germany: in winter in the south (Temminck). Selby says 'it is with us a regular winter visitant; and considerable numbers are annually taken in the decoys of Lincolnshire, Norfolk, &c. Montagu says that it is most abundant in the north of England and Scotland, and especially in the Orkney Islands. This assertion, however, I must in part contradict, as the result of long observation tells me it is of rare occurrence in the northern counties of England; and the same may be said of the southern districts of Scotland, which Dr. Fleming confirms in his history of British animals. With respect to the Orkneys, I cannot speak so confidently, although it appears probable that what had been represented to him as the present species was in fact the Long-tailed Duck (*Harelda glacialis*), which is found in great numbers during the winter in the bays of this group of islands. The Pintail has a wide geographical range, being met with in all the northern parts of Europe, Asia, and America, and retires in the summer to breed in high latitudes. Its equatorial migration extends as far as Italy; and during its periodical flight

to the southward it occurs abundantly in Holland, France, Germany, and other continental states. The marshes of the interior part of the country, and fresh-water lakes are its usual places of resort.* Pennant states that Mr. Hartlib, in the appendix to his 'Legacy,' tells us that these birds are found in great abundance in Connaught in Ireland, in the month of February only, and that they are much esteemed for their delicacy. C. L. Bonaparte (*Specchio Comparativo*) notes it as not very rare in the winter near Rome. See above, *Geographical Distribution*.

Food.—Similar to that of the Gadwall (Temminck). Selby says that its food consists of insects and their larvæ, the seeds of aquatic plants, particularly of some species of *Epilobium*, and vegetables.

Propagation.—The season of courtship is indicated in the male by suddenly raising himself upright in the water, bringing his bill close to his breast, and uttering at the same time a low soft note. This gesticulation is often followed by a jerk of the hinder part of the body, which is then also thrown above the water. **Nest,** in rushes and the thick herbage of marshes. Eggs, from eight to ten, bluish-white (Selby); eight or nine, greenish-blue (Temminck).

Pintailed Duck. *Dafila caudacea*.

HYBRIDS, &c.

Selby observes that the Pintail is easily domesticated, but rarely breeds in confinement. A hybrid progeny has been produced between it and the Wigeon; and, to such an extent do the sexual propensities seem to be affected in this state, by difference of food and other causes, that Montagu mentions a male Pintail in his menagerie which, for want of the other sex, showed an inclination to pair with a female Scaup, and even with a Bernicle Goose. He further adds, that one of them did pair with a tame duck, but that none of the eggs (upwards of twenty in number) proved to be fecundated.

Boschas.

Bill of Mallard. (Swainson.)

Mr. Swainson (*Journal of the Royal Institution*) comprehends under this sub-genus all those ducks usually denominated Teals, together with the mallard, long domesticated in our poultry-yards. 'As this,' continues Mr. Swainson, 'is by far the most numerous group, so it exhibits a greater diversity of form among the species. They are all however characterized by a bill *longer than the head*, whose breadth is equal throughout; it is sometimes indeed a little dilated, but never contracted at its tip, while the laminae of the upper mandible are entirely concealed by the margin of the bill. The neck and the tail, which in *Dafila* are both considerably lengthened, are much shorter in this group, which is further distinguished by the brightness and beauty of plumage observed in nearly all the species. On comparing the bill of the common Teal with that of the Pintail, we see a close affinity between the two forms. But as the tail of the first is so much developed in comparison to that of the Teal, it becomes essential to discover, if these sub-genera actually followed each other in nature, what species united them more closely. By the uniform liberality of the zoologists attached to the British Museum, and more particularly J. E. Gray, Esq., I am now enabled to do this. The beautiful *Anas (Boschas) formosa*, Sw., or Baikal Teal of methodists, is precisely a bird which intervenes between these two sub-genera. Essentially a Teal, it differs from all others I have yet seen in the superior length of its tail, the feathers of which are a full inch longer than the under-covers;* while the convexity of the bill, from being greater than in the common Teal, establishes its close approximation to *Dafila*. Proceeding thus by analysis, we find several foreign species which may be either called Teal or Ducks. The *Boschas Javanensis*, Sw., is more especially a bird of this description. It is closer allied to the mallard than to any other of the group: this is indicated by the more depressed form of the bill, and the white collar round the neck; the nape also is very conspicuously crested, a peculiarity found in no other group of the genus. To this and to the curled tail of the tame duck we shall presently advert. Having now reached what appears to be the typical form of *Boschas*, we see that nature as usual again departs from it. The bill of the mallard is throughout more depressed than that of the common Teal. This depression in fact, from being

Blue-winged Teal. *Boschas discors*.

Bill of Blue-winged Teal.

* In *Anas (Boschas) crecca* the tail is so short, that the under-covers reach almost to the middle of the tip of the middle tail feathers.

greater than that of the Gadwall, or of the Pintail, obviously assimilates more to the Shoveler. The affinity however appears remote, since the laminae of the mallard are concealed, while those of the Shovelers are conspicuously projecting. If therefore the affinity was immediate, it could only be demonstrated by a species having the bill of the common duck, but with the laminae projecting. Now such a species is actually the blue-winged Teal of North America, in which these laminae project nearly as much as in the Gadwall, while the upper mandible exhibits that peculiar sinuosity towards the base which is seen in no other ducks besides the Shovelers. If this affinity required any further support, it is placed beyond doubt by the fact mentioned in the 'General History of Birds,' that the plumage of the New Holland Shoveler, excepting the white facial crescent, is precisely the same as that of the blue-winged Teal,—the very bird which thus unites the sub-genus *Boschas* to that of *Anas*, and completes the circle of the whole group.

Of the sub-genus *Boschas*, the common mallard or wild duck, *Boschas domestica*, may be selected as an example. Both sexes of this beautiful bird are so well known that either description or figure would be superfluous. It is the *Canard sauvage* of the French; *Capo verde* (the male), *Anitra* (the female), *Germano*, and *Paperone* of the Italians; *Wilds Ente* and *Gemeine Ente* of the Germans; *Ethinneesen sheesheep* of the Cree Indians; Stock-Duck of the Hudson's Bay residents; and *Cors Huyad*, *Garan Huyad*, and *Hydmoy* of the antient British.

The weight of the wild mallard is usually about two pounds and a half. The abundance of the bird at one time in Britain may be judged of from the following passage in Pennant:—'Amazing numbers of ducks, wigeons, and teal are taken: by an account sent us of the number caught, a few winters past, in one season, and in only ten decoys, in the neighbourhood of Wainfleet, it appeared to amount to 31,200, in which are included several other species of ducks; it is also to be observed, that, in the above particular, wigeon and teal are reckoned but as one, and consequently sell but at half the price of ducks. . . . The account of the numbers here mentioned relates only to those that were sent to the capital. It was customary formerly to have in the fens an annual *driving* of the young ducks before they took wing. Numbers of people assembled, who beat a vast tract, and forced the birds into a net placed at the spot where the sport was to terminate. A hundred and fifty dozens have been taken at once; but this practice being supposed to be detrimental, has been abolished by act of parliament.' Selby observes upon this that the same district at the present time does not produce perhaps a dozen broods in the year.

Mr. Waterton has pointed out that the duck and the drake are clothed in the same plumage only for a very short time in the summer. Mr. Selby's observations on the change of plumage are referred to under the account of the Pintail.

The trachea of the mallard has at its lower extremity a labyrinth much larger than that of the gadwall, but not unlike it; the tube does not differ much in diameter throughout its length. In the museum of the Royal College of Surgeons, in London (Physiological series, gallery, No. 1124), are the termination of the trachea, inferior larynx, bronchiæ, and lungs of a drake. (*Anas Boschas*, Linn.)

Localities.—The wild duck is widely spread over a considerable portion of the globe. Few of the temperate and arctic regions are without it. Temminck places its habitation in the northern countries, and observes that it is known as a bird of passage nearly throughout Europe, haunting rivers, lakes, and marshes. C. L. Bonaparte (*Spechio Comparativo*) mentions it as very common near Rome in winter. For its American range, see *Geographical distribution* above.

Food.—Fishes, fry or spawn, slugs, water insects, aquatic plants, their seeds, and all sorts of grain (Temminck)—insects, worms, slugs, and all kinds of grain, &c. (Selby.)

Propagation.—In a natural state, says Selby, 'wild ducks always pair, though in a state of domestication they are observed to be polygamous. The pairing takes place towards the end of February or beginning of March, and they continue associated till the female begins to sit, when the male deserts her, joining others of his own sex similarly situated; so that it is usual to see the mallards, after May, in small flocks by themselves. About this time also they

begin to undergo the changes of colour that assimilate them in a great degree to the female, and which is retained till the period of the autumnal or general moult. The care of the young thus devolves entirely upon the duck, and is not partaken by the male, as Wilson and others appear to think; and this fact I have had frequent opportunities of verifying, as many wild ducks annually breed upon the edges of our Northumbrian moors, and the young broods are of course frequently under inspection as they descend the rivulets to the lower marshy parts of the country. The nest of the wild duck is generally made in some dry spot of the marshes, and not far from water, to which she can lead her progeny as soon as hatched. It is composed of withered grass and other dry vegetable matter, and usually concealed from view by a thick bush or some very rank herbage, though other and very dissimilar situations are occasionally chosen, as several instances have been recorded where they have deposited their eggs on the fork of a large tree, or in some deserted nest. Such an instance once occurred within my knowledge, and near my own residence, where a wild duck laid her eggs in the old nest of a crow, at least thirty feet from the ground. At this elevation she hatched her young; and as none of them were found dead beneath the tree, it is presumed she carried them safely to the ground in her bill, a mode of conveyance known to be frequently adopted by the Eider Duck.' Montagu (*Ornith. Dict., Suppl.*) says, 'we have been assured by a person of undoubted veracity that a half domesticated duck made a nest in Rumford Tower, hatched her young, and brought them down in safety to a piece of water at a considerable distance. Others have been known to breed in trees; and we recollect the nest of this bird being found in the head of an old pollard willow, impending the water, from whence the young might readily drop unhurt into their natural element. Mr. Tunstall mentions one, at Etchingham, in Sussex, which was found sitting upon nine eggs, on an oak-tree, twenty-five feet from the ground: and the author of the 'Rural Sports' records an instance of one taking possession of the nest of a hawk in a large oak. To these we can add, upon the testimony of a gentleman of the strictest veracity, that out of a large flock of half-domesticated ducks, one deposited her eggs in the principal fork of a large tree near his house.' Eggs, ten to fourteen, of a bluish-white; the female, when she quits the nest for food, covers them with down and other substances.

Our limits will not allow us to detail the different methods of taking the wild duck, and we must refer the reader to the works of Willughby, Pennant, and Bewick, for descriptions of the decoy, the latter furnished by Mr. Bonfellow; to those of Wilson and others, for various modes of capture; and to Col. Hawker's well-known book, for the modes of hut-shooting, &c., and some particulars relating to decoys.

In a domesticated state it is most widely distributed. All the varieties that the fancy of the breeder can produce are to be seen in the various poultry-yards. To say nothing of the Aylesbury and other breeds, where size and delicacy of flesh have been principally considered, we find penguin ducks standing nearly erect, hook-billed ducks, and even a variety where the caprice of man has succeeded in nearly obliterating the webs of the feet and curtailing the bill till it has lost its spatulate shape and is become a deformity, bearing some resemblance to the bill of a common fowl. Some of these birds have been shown as the offspring of a cock and a duck, we need hardly say, without the slightest foundation for the monstrous assertion. Selby observes, that in the domesticated varieties the peculiar specific distinction of the curled feathers of the tail is still retained. In China and the other countries of the East, numbers of ducks are hatched by artificial means.

HYBRIDS.

Latham states that the male Muscovy duck and common duck will breed together. The young bear a greater resemblance to the common duck than to the Muscovy duck.

In 'Fauna Boreali Americana' Mr. Swainson places the genera *Mareca* and *Dendrocygna* in his sub-family *Anatina* *Mareca*. (Stephens.)

Selby says that the wigeons are distinguished from the teal by a much shorter and less cylindrical bill; and from the ducks, by that member becoming more contracted and narrow, instead of widening towards its tip. The laminae of the bill are also broader and set wider apart, approaching

in form nearer to those of the sub-family *Anserina*. These birds, he adds, also vary in their habits, for instead of searching and sifting the mud with their bills for insects, seeds, &c., upon which food most of the other genera live, they subsist principally on grasses and vegetable diet, which they pluck in the same manner as geese. Their flight is strong and swift, and they have a peculiar shrill whistling call note. In the shape of the tracheal labyrinth they resemble the Pintail more than any other species: the middle feathers of the tail are also acute, and considerably longer than the rest.

Bill of Wigeon.

Example, *Mareca Americana* (Stephens), *American Wigeon*. This is the *Anas Americana* of Gmelin and of Sabine, in Franklin's Journal, and *Athechemou-weeshep* of the Cree Indians.

Description of a male killed on the Saskatchewan, May, 1827 (Richardson). *Colour*.—A white band from the forehead to the nape, bounded behind the eye by a broad dark-green patch, which ends in the nuchal crest. Upper part and sides of the breast brownish-red, glossed with grey. Base of the neck above, interscapulars, scapulars, and flanks, minutely undulated with brownish-red and black; hind part of the back undulated in a similar manner with clove-brown and white, the latter colour prevailing on the tail-coverts. Lesser wing-coverts, primaries, and tail, clove-brown; intermediate and greater coverts, sides of the rump, breast, and belly, pure white. *Speculum*, velvet-black below, duck-green above, bounded superiorly with black and posteriorly with white. Exterior webs of the tertiaries, and lateral and inferior tail-coverts, greenish-black, the first bordered with white. *Bill*, bluish-grey, bordered and tipped with black.

Mareca Americana.

Form.—Bill particularly short, being not so long as the head, armed with *laminae* resembling those of the mallard. Plumage of the nape somewhat lengthened. *Wings*, above

an inch shorter than the acutely-pointed tail, which consists of fourteen feathers. Total length, 23 inches.

The female has the upper plumage dark liver-brown, edged and remotely barred with pale-brown and white. The intermediate wing-coverts are merely edged with white, and there is no green on the head. *Tail*, shorter and not so tapering. Total length about two inches less than the male.

Localities, Propagation, Habits, &c.—Wilson says that it is very common in winter along the whole coast from Florida to Rhode Island; but most abundant in Carolina, where it frequents the rice plantations. In Martinico great flocks take short flights from one rice-field to another during the rainy season, and are much complained of by the planters. They are said to be in great plenty at St. Domingo and Guiana, where they are called vingeon or gingeon. Are said sometimes to perch on trees. Feed in company (but little in the day), and have a centinel on the watch. Come out from their hiding-places in the evening. Are not known to breed in any part of the United States. Are common in the winter months along the bays of Egg Harbour and Cape May, and also those of the Delaware. They leave their places in April, and appear upon the coast of Hudson's Bay in May, as soon as the thaws come on, chiefly in pairs; lay there only from six to eight eggs, and feed on flies and worms in the swamps; depart in flocks in autumn. (Wilson here quotes Hutchins.) Wilson further states, that the wigeon is extremely fond of the tender roots of that particular species of aquatic plant on which the Canvass-back duck, so abundant in Chesapeake Bay, feeds. The wigeon is its constant companion; and the wigeon, which never dives, watches the moment of the Canvass-back's rising with the morsel for which the latter bird has dived, and before he has his eyes well opened, snatches it and makes off. On this account the Canvass-backs and wigeons, or, as they are called round the bay, *Bald Pates*, live in a state of perpetual contention.

Dendronessa (Swainson).

Bill of Summer Duck.

Head crested. *Bill* as high at the base as it is broad; towards the tip narrow and contracted. *Nostrils* placed towards the middle of the bill. *Tertial feathers* ornamented. *Feet* as in *Anas*. Type *Dendronessa galericulata*, *Chinese Teal*. Edwards, pl. 102.

Mr. Swainson, who thus characterizes the genus, observes ('Fauna Boreali Americana') that 'this is obviously the rasorial type of the *Anatinae*. The *D. Sponsa*, by the lateral advancement of the bill towards the eye, is a more aberrant species, and shows the connection of the group to *Somateria*.'

Example. *Dendronessa Sponsa* (Swainson), the *Summer Duck*. This is the *Wood Duck* of Audubon, *Aneco-aemo* of the Chippewas, *Anas Sponsa* of Linnæus.

Description of a male, killed at Cumberland House, lat. 54°; June, 1827. *Colour*.—Head above and space between the eye and bill glossy dark-green; cheeks and a large patch on the sides of the throat purple, with blue reflections; pendent occipital crest of green and auricula purple, marked with two narrow white lines, one of them

terminating behind the eye, the other extending over the eye to the bill; sides of the neck purplish-red, changing on the front of the neck and sides of the breast to brown, and there spotted with white. Scapulars, wings, and tail exhibiting a play of duck-green, purple, blue, and velvet-black colours; interscapulars, posterior part of the back, rump, and upper tail-coverts blackish green and purple; several of the lateral coverts reddish-orange; a hair-like, splendid, reddish-purple tuft on each side of the rump; the under coverts brown. Chin, throat, a collar round the neck, a crescentic bar on the ears, the middle of the breast, and whole of the abdomen, white. Flanks yellowish-grey, finely undulated with black; the tips of the long feathers, and also those on the shoulder, broadly barred with white and black. Inner wing-coverts white, barred with brown. Almost all the coloured plumage shows a play of colours with metallic lustre. *Bill* red; a space between the nostrils, its tip, margins, and lower mandible, black. *Legs* orange-coloured.

Summer Duck. *Dendronessa sponsa*. Male

Form.—*Bill* shorter than the head; considerably narrowed towards the tip, like that of the Eider; its height at the rictus greater than its width; its frontal angles prolonged. *Mandibles* strongly toothed. *Unguis* strong, arched or hooked. *Nostrils* large, pervious, lateral. *Fore-head* sloping. *Occipital crest* long and pendent. *Wings* shorter than the tail, which consists of sixteen wide rounded feathers. Total length 21 inches.

The female wants the fine lines on the flanks and the hair-like tufts on the sides of the rump. She has a shorter crest; and the plumage is less vivid, especially about the head, where it is mostly brown. (Richardson.)

Localities.—Audubon states that this species ranges over the whole extent of the United States, and that he saw it in all parts, from Louisiana to the confines of Maine, and from the vicinity of the Atlantic coasts as far inland as his travels extended. It also occurs sparingly during the breeding season in Nova Scotia; but farther north he did not observe it. Everywhere in this immense tract he found it an almost constant resident; for some spend the winter even in Massachusetts, and far up the warm spring waters of brooks on the Missouri. It confines itself, however, entirely to fresh water, preferring at all times the secluded retreats of the ponds, bayous, or creeks, that occur so profusely in the woods. Well acquainted with man, they carefully avoid him, unless during the breeding season, when, if a convenient spot is found by them, they will even locate themselves about the miller's dam.

Habits, &c.—Our limits will not permit us to insert Audubon's interesting account of the general habits, food, &c. of the Summer Duck. (See *Ornithological Biography*, vol. iii., p. 52, &c.)

Chase.—See the same work.

Propagation.—Catesby says that the Summer Ducks breed in Virginia and Carolina, and make their nests in the holes of tall trees (made by woodpeckers) growing in water, particularly cypress trees. 'While they are young and

unable to fly, the old ones carry them on their backs from their nests into the water; and at the approach of danger, they fix with their bills on the backs of the old ones, which fly away with them.' Audubon's evidence, which we here give, differs from that of Catesby in some particulars. 'The Wood Duck breeds in the Middle States about the beginning of April, in Massachusetts a month later, and in Nova Scotia or on our Northern Lakes seldom before the first days of June. In Louisiana and Kentucky, where I have had better opportunities of studying their habits in this respect, they generally pair about the 1st of March, sometimes a fortnight earlier. I never knew one of these birds to form a nest on the ground or on the branches of a tree. They appear at all times to prefer the hollow broken portion of some large branch, the hole of our largest woodpecker (*Picus principalis*), or the deserted retreat of the fox squirrel; and I have been frequently surprised to see them go in and out of a hole of any one of these, when their bodies while on wing seemed to be nearly half as large again as the aperture within which they had deposited their eggs. Once only I found a nest (with ten eggs) in the fissure of a rock on the Kentucky River, a few miles below Frankfort. Generally, however, the holes to which they betake themselves are either over deep swamps, above cane-brakes, or broken branches of high sycamores, seldom more than 40 or 50 feet from the water. They are much attached to their breeding places, and for three successive years I found a pair near Henderson, in Kentucky, with eggs in the beginning of April, in the abandoned nest of an ivory-billed woodpecker. The eggs, which are from six to fifteen, according to the age of the bird, are placed on dry plants, feathers, and a scanty portion of down, which I believe is mostly plucked from the breast of the female. They are perfectly smooth, nearly elliptical, of a light colour between buff and pale green, two inches in length by one and a half in diameter; the shell is about equal in firmness to that of the mallard's egg, and quite smooth. No sooner has the female completed her set of eggs than she is abandoned by her mate, who now joins others, which form themselves into considerable flocks, and thus remain apart until the young are able to fly, when old and young of both sexes come together, and so remain until the commencement of the next breeding season. In all the nests which I have examined, I have been rather surprised to find a quantity of feathers belonging to birds of other species, even those of the domestic fowl, and particularly of the wild goose and wild turkey. On coming upon a nest with eggs when the bird was absent in search of food, I have always found the eggs covered over with feathers and down, although quite out of sight in the depth of a woodpecker's or squirrel's hole. On the contrary, when the nest was placed in the broken branch of a tree, it could easily be observed from the ground, on account of the feathers, dead sticks, and withered grasses about it. If the nest is placed immediately over the water, the young, the moment they are hatched, scramble to the mouth of the hole, launch into the air with their little wings and feet spread out, and drop into their favourite element; but whenever their birth-place is at some distance from it, the mother carries them to it one by one in her bill, holding them so as not to injure their yet tender frame. On several occasions, however, when the hole was thirty, forty, or more yards from a bayou or other piece of water, I observed that the mother suffered the young to fall on the grasses and dried leaves beneath the tree, and afterwards led them directly to the nearest edge of the next pool or creek.'

Dendronessa galaricucata and *D. sponsa* breed freely in captivity. Both species have produced several broods in the gardens of the Zoological Society in the Regent's Park, where most of the Anatinae here enumerated may be seen. Our limits not allowing us to describe more than one species of a genus, we must refer the reader to Edwards and others for the description of *D. galaricucata*, which he will find stuffed in most of our museums, and, generally, alive in the gardens at the Regent's Park, where he will have an opportunity of studying the oriental and occidental forms of *Dendronessa*, and their habits in a half-domesticated state.

Mr. Yarrell (*Zool. Proc.*, 1830-31) stated to the society that the *Summer Duck*, *D. sponsa*, male and female, had been shot recently near Dorking.

Lieutenant-Colonel Sykes, in his 'Catalogue of Birds observed in the Dukhun' (Deccan), enumerates the following British *Anatinae*—*Anas strepera*, Linn., males identical with specimens in the British Museum, from Kent; no

Mandarin Duck. *Dendronessa galariculata*. Male.

females for comparison; numerous in Dukhun; *Rhynchastis virescens*, Leach, MSS., *Anas clypeata*, Linn.; identical with British specimens of the common *Shoveler*, but differing from the description of that bird in Shaw; *Mareca fistularis*, Steph., *Anas Penelope*, Linn., *Wigeon*, absolutely identical with specimens from Devonshire; *Querquedula Circa*, Steph.; *Anas Circa*, Linn., *Garganey*, identical with British specimens; *Querquedula Crecca*, *Anas Crecca*, Linn., *Common Teal*, identical with male and female British specimens. (*Zool. Proc.*)

Mr. Keith Abbott (*Zool. Proc.*, 1834), in his 'List of Trebizond Birds,' enumerates *Anas Boschas*, Linn., the *Mallard*, as almost universal; and *Anas Querquedula*, Linn., which is noted as inhabiting India as well as Europe, and as common in the Himalayan range.

FOSSIL ANATINÆ.

Dr. Buckland (*Bridgewater Treatise*) mentions and figures the duck *Anas*, (the figure represents the common wild duck), among the land mammals and birds of the third period of the tertiary series, and he observes that many of the genera there enumerated occur both in the second, third, and fourth formations of the tertiary series, and also in caverns, fissures, and diluvium. Thus, among the remains found in the Kirkdale Cave (*Reliquiæ Diluvianæ*), he enumerates and figures the right coracoid process of the scapula of a small species of duck or wigeon. Dr. Buckland also observes that the eggs of aquatic birds have been preserved in the lacustrine formations of Cournon, in Auvergne. (See Croizet and Jobert, *Recherches sur les Oss. Foss. du Départ. du Puy de Dome, &c.*)

For the rest of the families or subfamilies of the great genus *Anas*, see FULIGULINÆ, GEESE, MERGANINÆ, SWANS.

DUCLOS, CHARLES PINEAU, was born in the year 1704, at Dinant, in Bretagne, whence he was sent to Paris to prosecute his studies. He soon formed a connection with the wits of the age, and published a Romance called 'Acajon et Zirphile.' This work attained only moderate celebrity; but a subsequent romance, entitled 'Confessions du Comte de * * *,' was more successful. His reputation however depends on a collection of moral essays, published under the title of 'Considérations sur les Mœurs de ce Siècle,' which have been greatly extolled by many writers, and which Louis XV. characterized as 'the work of an honest man.' In 1739 Duclos was admitted into the Academy of Inscriptions, and in 1747 into the Académie Française, of which he became perpetual secretary. The citizens of his native town, to testify their respect for him, made him their mayor in 1744, but he continued to reside at Paris, where he died in 1772.

The romances of Duclos, though less indecent than the works of Crébillon the younger, are sufficiently indelicate to offend persons of refined taste, while they lack the bitter satire and deep knowledge of human nature which characterize that acute though obscene author. With all deference to the opinions of his distinguished contemporaries, we cannot help thinking that his 'Considérations' is but an indifferent performance. They are a series of essays on

the opinions which regulate society, and though free from the misanthropic ill-nature which appears in Rochefoucauld and occasionally in La Bruyère, they are deficient in the real depth which those writers exhibit, and want that charm of novelty and originality which is necessary to make more moral essays palatable. The romances and essays have been collected into four vols., 8vo., under the title of 'Œuvres Morales et Galantes.' Duclos also wrote a history of Louis XI., and a secret history of Louis XIV. and XV., which have acquired some reputation.

DUCTILITY is the property of bodies, and more especially of the metals, which admits of their being drawn out in length, while their diameter is diminished without any actual fracture or separation of their parts; in other words, it is upon this property that the wire-drawing of metals depends. The following is nearly the order of ductility of the metals which possess the property in the highest degree; that of the first-mentioned being the greatest—gold, silver, platinum, iron, copper, zinc, tin, lead, nickel, palladium, cadmium.

Though the malleability and ductility of metals are connected, they are not always in the same proportion; iron, for example, though extremely ductile, cannot be beaten into very thin laminæ. The difference between ductility and malleability has been ascribed to the figure and arrangement of their particles; the malleable metals may be conceived to consist of small plates, and the ductile metals of minute fibres placed beside or over each other; the one slide by their flat surfaces, the other lengthen and exert an adhesion from one extremity to the other.

According to Muschenbroek, a workman of Augsburg drew a grain of gold into a wire 600 feet long; its diameter must have been only 1-4600th of an inch. In the Philosophical Transactions for 1813, Dr. Woollaston has described a method by which he succeeded in obtaining a wire only 1-30,000th of an inch in diameter.

Of a silkworm's thread 300 feet weigh one grain; the same length of a spider's web weighs only 1-35th as much, and consequently 10,500 feet weigh only a grain.

DUDLEY, originally written DUDELEI, a market-town and parish in the lower division of the hundred of Halfshire, in the county of Worcester (though locally in the hundred of Offlow, in Staffordshire), 26 miles north-north-east from Worcester, 9 north-west by north from Birmingham, and 127 north-west by north from London.

Dudley owes its origin to Dodo, a Saxon prince, who built here a strong castle, situated on a considerable eminence, about the year 700. In the reign of Henry II. it belonged to Gervase Paganell, and was demolished by that king in consequence of Gervase's taking part in the rebellion of his son, prince Henry. In 1644 the castle was gallantly defended by Colonel Beaumont against the parliament forces for three weeks, when it was relieved by a party of the royal army from Worcester. The remains, consisting of a gateway, the keep, part of the tower, the offices, &c., form a highly interesting ruin.

About half a mile from the town are the ruins of an ancient priory of Benedictine monks of the order of Cluny, founded by Gervase Paganell. A mayor and other officers are annually appointed by the lord of the manor, but the town is within the jurisdiction of the county magistrates. The houses are generally neat and well-built, and the streets clean and well paved, and lighted with gas. An extensive subscription library was established in 1805.

The principal trade of Dudley consists in the smelting and working of iron ore, with which the whole neighbourhood abounds, as well as with coal. The articles manufactured are various iron utensils, nails, and glass. In 1831 the coal-mines in the parish employed 500 men; 570 were employed as nailers, and a large number in the iron-works. There are extensive quarries of limestone in the neighbourhood. A tunnel, one mile and three-quarters in length and thirteen feet high, has been cut through the hill on which the castle stands for conveying the limestone under the castle-hill to the kilns. Fairs are held on the 8th of May and 2nd of October, for cattle, cheese, and wool; and on the 5th of August for lambs. Saturday is the market-day.

The population consists of 23,000 persons, the major part of whom are engaged in mining, manufacturing nails, and smelting iron ore. Dudley sends one member to the House of Commons, under the Reform Act.

The living is a vicarage in the diocese of Worcester. There are two churches, St Thomas and St. Edmund, and

a chapel of ease, recently erected. St. Thomas is a handsome building in the modern style of English architecture, with a lofty spire. There are places of worship for Methodists, Baptists, Independents, Unitarians, and the Society of Friends. The free grammar-school was founded by Thomas Wattewood, clothier, of Stafford, and Mark Bysmor, stillworker, of London, and endowed with land by queen Elizabeth, the annual value of which is now above 300*l*. The master receives 200*l*. a year, and the number of scholars averages about 30 or 40. A charity-school for clothing and educating 40 girls, and another charity for clothing seven poor men was established in 1819, by Mrs. Cartwright, in consequence of a legacy left for that purpose by the Rev. Henry Antrobus. A school for clothing and educating 50 boys was founded 1732, and endowed with land by Robert, Samuel, and Ann Baylis. About 200 boys are educated here, exclusively of those on the foundation. There is a blue school, where 230 boys, and a school of industry, where 220 girls are educated. The Unitarians have also a school for girls.

A fossil called the Dudley Locust is found in great quantities and variety of sizes in the limestone quarries in the neighbourhood; it is supposed to be an extinct species of *Monoculus*. Nash, in his 'History of Worcestershire,' mentions one four inches five-eighths in length, and three inches three-fourths in width.

In the vicinity of Dudley there are several chalybeate springs, as well as a spa well, held in high estimation for its efficacy in cutaneous disorders.

DUEL, a hostile meeting between two persons in consequence of an affront given by one of them to the other, and for the purpose (as is said) of *satisfaction* from the person affronting to the person affronted. Such is a general description of the duel, as now existing in England and other European nations, and in America.

The rise of the present duel, or practice of duelling, is to be referred to the trial by battle which obtained in early ages, jointly with the single combat or tournament of the age of chivalry, which again most probably owed its own existence to the early trial by battle. This trial by battle, or duel (as it was also called), was resorted to, in accordance with the superstitious notions of the time, as a sure means of determining the guilt or innocence of a person charged with a crime, or of adjudicating a disputed right. It was thought that God took care to superintend, and to see that, in every case, innocence was vindicated and justice observed. The trial by battle, or duel, thus viewed, was introduced into England by William the Conqueror, and established in three cases; viz., in the court-martial or court of chivalry, in appeals of felony, and in civil cases upon issue joined in a writ of right. Once established as a mode of trial, the duel was retained after the superstition which had given rise to it had died away, and was resorted to for the purpose of wreaking vengeance, or gaining reputation by the display of courage. Then came the age of chivalry, with its worship of punctilio and personal prowess, its tilts and tournaments; and the duel, originally a mode of trial established by law, became in time (what it now is) a practice dependent on certain conventional rules of honour, or on fashion.

We shall confine ourselves to a consideration of the duel in its present character. This duel takes place, as we have already said, in consequence of an *affront*. In order then to have a complete notion of the present practice of duelling, we must understand what an affront is, and the best way of explaining this word *affront* is the way of enumeration; for were we to content ourselves with saying that an affront is anything which (in the common phrase) hurts a man's feelings, or again, which wounds his honour, we should only be using words which themselves require to be explained as much as the word *affront*. We might as well say at once, forgetting that it is our object to explain the grounds or reasons of a duel, that an affront is anything which is at any time the ground or reason of a duel; for we should give as much and as correct information by this as by either of the preceding explanations.

An affront is considered to be given when one man charges or insinuates against another that he is guilty of a lie, of dishonesty in pecuniary transactions, of cowardice, of hypocrisy, of being actuated by one motive or set of motives when he professes to be actuated by others; when (in the common phrase, which is sufficiently vague and comprehensive), one man imputes motives to another; when he indulges in expressions of contempt, or what is styled

personal and virulent abuse; and also when one man impugns or disparages, in any of the above-mentioned ways, the character of some relative or intimate friend of another man. An insult or injury to a female relative in particular, or to a female companion, such as a partner in a ball-room, is always accounted a great affront. Sometimes even the simple fact of success in an amatory affair is construed by the unsuccessful rival as an affront, and he who has succeeded is called upon for satisfaction. Such are the principal affronts which, according to custom or fashion or (as it is also called) the law of honour, are, at different times, reasons or grounds for fighting a duel.

When any one of these affronts has been given by one man to another, it is the custom or fashion for this last to call on the affronter to retract, explain, or apologize for (as the case may be) that which constituted the affront, or else (in significant phrase) to give the usual satisfaction,—that satisfaction (as it is also sometimes circumloquized) which one gentleman expects from another. He at the same time usually names some friend, in whose keeping (to use the fashionable phrase) he places his honour, and to whom his affronter is to address any communication. This call or challenge having reached its destination, and the affronter being unable or unwilling to retract, explain, or apologize, he too singles out a friend to whom he likewise entrusts his honour; the two friends or seconds (as they are called) then make arrangements for a meeting between the affronter and the person affronted, or (varying the expression) the challenger; they fix the time and place, and get ready the weapons; the meeting takes place; the word *fire* is uttered, according to a previous agreement between the seconds; the hostilities commence, and they proceed until one of the parties either fires in the air, or is killed or wounded, or until the seconds interfere to stop them. The parties, or rather so many of them as are alive, then leave the ground, satisfied; the principals (if both are alive) sometimes shaking hands with one another, to denote either the return or the commencement of friendship. Such are most of the circumstances of a duel.

It is professed that this duel takes place for the purpose of *satisfaction*. The affronter professes to have satisfied the man whom he has affronted, and the challenger professes to have been satisfied by the man whom he has challenged, after they have fired, or have had an opportunity of firing, pistols at one another. That this satisfaction, which the one professes to give and the other to receive, is of that sort which is also expressed by the word *reparation*, is of course out of the question. Satisfaction in this its most obvious sense, or reparation for an injury, cannot be effected by the injured man firing at his injurer, and (what is more) being fired at in return.

The satisfaction furnished by a duel is of a different sort, and of a sort which, were it distinctly comprehended, would at once show the absurdity of the practice; it is a satisfaction occasioned by the knowledge that, by standing fire, the challenger has shown his courage, and that the world cannot call him coward. Now it is clear that there would be no reason for dissatisfaction on this point, previous to the fighting of the duel, and therefore no reason for seeking satisfaction of this sort, were it not that the practice of duelling existed. Were men not in the habit of fighting duels, and therefore not expected to expose themselves to fire after having received an affront, there would be no ground for calling their courage into question, and therefore no necessity for satisfying themselves that the world thinks them courageous. The practice of duelling then itself causes the evil which it is called in to remedy,—the injury for which it is required to administer satisfaction. Such being the case, we call the practice absurd. And every one who saw this would immediately see its absurdity. But the word *satisfaction* is conveniently ambiguous. When one speaks of it, or hears it spoken of, one thinks of that satisfaction which means reparation for an injury, and which is not the satisfaction furnished by the duel; and it is fancied that the practice has some reason in it. Thus are men the dupes of words.

The real object then of the duel is, in most cases, to satisfy the person who provokes it, or who sends the challenge, that the world does not suspect him of a want of courage; and it will be useful to observe, in passing, that the duel furnishes this sort of satisfaction as well to the man who gave the affront, as to him who was affronted. Its object also, in certain cases, is doubtless to gratify the vengeance of the

man who has received an affront. But in all cases that object which is professed, or which is generally understood to be professed, of satisfaction in the sense of reparation for the affront, is no more than a pretence.

Though the practice of duelling, however, cannot and does not effect the good of repairing an injury, it may very possibly effect other sorts of good. It is a question then worthy of consideration, whether this practice is, on the whole, productive of good or of evil? If it be, on the whole, productive of evil, another question arises, how is it to be got rid of?

The advantage of the practice of duelling is generally said to consist in its tendency to increase courtesy and refinement of manners. So far as this tendency exists or is supposed to exist, the manner in which it operates, or is supposed to operate, is obvious. It is, or is supposed to be, a reason for a man to abstain from giving an affront, that he will be subjected in consequence to the fire of a pistol.

Now it is clear, in the first place, that all the affronts which are constituted reasons or grounds of duels by fashion, or the law of honour, or (which is the same thing) public opinion, are so constituted because they are judged by public opinion deserving of disapprobation. If then the practice of duelling did not exist, public opinion, which now constitutes these affronts grounds of a duel, as being deserving of disapprobation, would still condemn them, and, condemning them, provide men with a reason to abstain from them. Thus there would still exist a reason to abstain, in all cases in which the practice of duelling now provides a reason. But, in the second place, the practice of duelling itself depends on public opinion alone. A man fights because public opinion judges that he who, in certain cases, refuses to challenge or to accept a challenge is deserving of disapprobation; he fights from fear of public opinion. If he abstain from giving an affront on account of the existence of the practice of duelling, it is because the fear of public opinion would oblige him to fight; he abstains then from fear of public opinion. Now we have seen that there would be the fear of public opinion to deter him from the affronts which now lead to duels, if the practice of duelling did not exist. Thus the practice of duelling does not in any case provide a reason to abstain, which public opinion would not provide without its aid. As a means then of increasing courtesy and refinement of manners, the practice of duelling is unnecessary; and inasmuch as its tendency to polish manners is the only advantage which can, with any show of probability, be ascribed to it, there will be no good effects whatever to set against the evil effects which we now proceed to enumerate. There will be no difficulty in striking the balance between good and evil.

First, the practice of duelling is disadvantageous, inasmuch as it often diminishes the motives to abstain from an affront. We have seen that the existence of this practice leads public opinion to employ itself concerning the courage of the two persons, who (the one having affronted and the other having been affronted) are in a situation in which, according to custom or fashion, a duel takes place. Public opinion then is diverted by the practice of duelling from the affront to the extraneous consideration of the courage of the two parties. It censures the man who has given the affront only if he shrinks from a duel; and even goes so far as to censure the man who has received the affront for the same reason. Thus in a case where a man, reckless of exposing his life, is disposed to give affronts, he is certain that he can avert censure for an affront by being ready to fight a duel; and in a case where a bold or reckless man is disposed to affront one who is timid, or a man expert with the pistol one who is a bad shot, he can reckon on the man whom he affronts refusing to fight, and on censure being thus diverted from himself who has given an affront to him who has shown want of courage. It is well observed in a clever article in the *Westminster Review*:—"It is difficult to conceive how the character of a bully, in all its shades and degrees, would be an object of ambition to any one, in a country where the law is too strong to suffer actual assaults to be committed with impunity, where public opinion is powerful, and duelling not permitted; but where duelling is in full vigour, it is very easy to understand that the bully may not only enjoy the delight of vulgar applause, but the advantages of real power." (vol. iv., p. 28.)

Secondly, the practice of duelling is disadvantageous, as increasing the amount of injury which one man can do to another by an affront. There is not only the injury to his

feelings occasioned by the affront, but also the fear excited by the danger to which the existence of the practice of duelling subjects him, after receiving the affront.

Thirdly, the practice of duelling affords means for the gratification of vengeance; and thus tends to hurt the characters of individuals, by the encouragement both of that feeling, and of hypocrisy in those who, thirsting for vengeance, and daring not to own it, profess (in the common ambiguous phrase) to be seeking for satisfaction.

Fourthly (which is the most important consideration), there are the evils entailed by the deaths which the practice of duelling brings about,—evils entailed both on the persons dying, and on their surviving relatives and friends. It is an evil that a man should be cut off from life, 'unhoused, disappointed, unaided.' It is an evil, that he should be taken from relatives and friends to whom his life is, in different ways and degrees, a source of happiness; from the parents who have centered in him their hopes, and to whom, in their declining years, he might be a comfort, or from the wife and children who look to him for support.

Such are the evil effects of the practice of duelling; and there being no list of good effects to set against them, it follows immediately that the tendency of the practice is, on the whole, evil. There arises then the question, how is it to be got rid of?

A mild and judicious legislation, one which takes into account, and does not set itself violently against, public opinion, may do much. The punishment assigned to the crime of duelling should (in Mr. Bentham's phrase) be *popular*. It should be a punishment which does not tend to excite sympathy for the criminal, and thus defeat its own object; for where an opinion prevails that a punishment is too severe, or where (in other words) a punishment is unpopular, witnesses, jurors, judges are provided by the punishment itself with motives to shield the criminal. It is clear that the punishment of death, which the law of England now assigns, is not popular; and it is clear further that, in consequence of this, it is almost entirely nugatory. Public opinion, which favours duelling, sets itself against the punishment of death, and renders legislation vain.

Were a man who had killed his antagonist in a duel compelled by the law to support, or assist in supporting, some of his surviving relatives, this, so far as it would go, would be a punishment popular and efficacious. Public opinion would then infallibly be against the man who, having incurred the penalty, should endeavour to avoid it. And such a punishment as this would furthermore be superior to the punishment of death, as being susceptible of gradation, as furnishing reparation to a portion of those who have been most injured, and as preserving the offender, that he may have all those opportunities, which his natural life will afford him, of improving himself and of benefiting others.

A mild and judicious legislation would tend to guide and improve public opinion; whereas such a legislation as the present tends only to confirm it in its evil ways.

And as legislation may and should assist the formation of a right public opinion, so is it possible and desirable to operate independently on public opinion, either that the absence of good legislation may, as far as is possible, be compensated for, or that the good legislation, when present, may in turn be assisted. Now this operation on public opinion must be brought about by the endeavours of individuals. It is the duty of each man to oppose this practice to the utmost extent of his power, both by precept and example; or (changing the phrase) each man will effect the greatest amount of good for himself and for his fellow men by adopting this course. It is his duty to abstain from challenging when he has received an affront, and to refuse a challenge when he is considered to have given one, making public in both cases, so far as his situation allows, his reasons for the course which he takes, and thus producing an impression against the practice as widely as he can. In the second of these two cases he must either be able to defend, or he must apologize for, that which was considered an affront. If he can defend it, or show that the evil to the person insulted was overbalanced by the good accruing to others, he refuses rightly to be fired at for having been the author of a benefit; or, if unable to defend the affront, he apologizes for it, he performs a manly and a rational part in refusing to fire at a man whose feelings he has wantonly injured.

This duty is peculiarly incumbent on public men, whose sphere of influence is larger, and whose means of producing good effects by example are therefore greater, than those of others. A public man who should at all times refuse to challenge or to accept a challenge, resting his refusal on the ground of the evil tendency of duelling, not of the infraction of some other duty which an accident has in his case connected with it (as the violation of an oath), and who should at the same time preserve himself from suspicion or reproach by circumspection in speech, by a manly defence, where it is possible, and, where it is not, by a manly apology, would be a mighty aid for the extirpation of this practice.

We have said nothing as to the objections to duelling on religious grounds, it being never denied, so far as we are aware, that the practice is incompatible with the profession of Christianity.

DUET (*Duetto*, Ital. from *Duo*), a musical composition for either two voices or two instruments. According to the Padre Martini, the *duo* is a vocal composition in the severe ecclesiastical style, without any kind of accompaniment; the *duetto*, or diminutive of *duo*, one written more freely, in a lighter manner, and admitting accompaniment. The older word is now, however, become obsolete.

DUFRESNE. [CANGE, Du.]

DUGDALE, SIR WILLIAM, was the only son of John Dugdale, Esq., of Shustoke, in the county of Warwick, where he was born September 12th, 1605. His mother was Elizabeth, daughter of Arthur Swynfen, Esq., of Staffordshire. He was in part educated in the free-school at Coventry, and subsequently with his father, with whom he also read 'Littleton's Tenures,' some other law-books, and history. In 1622 he married Margery, the second daughter of John Huntbach, Esq., of Seawall, in Staffordshire. Upon his father's death in 1624, he succeeded to a small estate in Shustoke, to which he added by purchase the manor of Blythe, in that parish, in 1625. This latter estate is still in the possession of his descendants.

Dugdale's natural inclination, which was chiefly the study of antiquities, brought him acquainted with the most eminent antiquaries of his day. Sir Symon Archer, of Tamworth, introduced him to Sir Christopher Hatton and Sir Henry Spelman, by whose joint interest with the earl of Arundel, then Earl Marshal, he was created a pursuivant-at-arms extraordinary, by the name of Blanche Lyon, in September, 1638. Afterwards he was made Rouge Croix pursuant in ordinary, by letters patent dated March 18th, 1639-40; by which means, having lodging in the Herald's College, and convenient opportunities, he made large collections from the Records in the Tower of London, as well as from other places.

In 1641, by Sir Christopher Hatton's encouragement, he superintended the making of exact drafts of all the monuments in Westminster Abbey, St. Paul's Cathedral, and in many other cathedral and parochial churches of England; particularly those at Peterborough, Ely, Norwich, Lincoln, Newark-upon-Trent, Beverley, Southwark, Kingston-upon-Hull, York, Selby, Chester, Lichfield, Tamworth, Warwick, &c. The drawings were made by one William Sedgewick, an arms-painter, then a servant of Sir Christopher Hatton; the inscriptions were copied by Dugdale. Both were deposited in Sir Christopher Hatton's library, that the memory of these monuments might at least be preserved; the state of the times threatening imminent destruction to the originals.

In June, 1642, the king, who had retired to York, summoned Mr. Dugdale to attend upon him, according to the duty of his office. Dugdale accordingly repaired to York, and was afterwards commanded to attend the earl of Northampton, who was marching into Worcestershire to oppose the forces raised by lord Brooke for the service of the Parliament. He attended upon the king at the battle of Edgehill, and afterwards at Oxford, where he continued with his Majesty till the surrender of the garrison there to the Parliament, June 22nd, 1646. He was created M.A. November 1st, 1642; and April 16th, 1644, was promoted to the office of Chester-herald. During his long residence at Oxford, he applied himself to such researches in the Bodleian, and the different college libraries, as he thought might conduce toward the furtherance of the 'Monasticon,' then designed by Roger Dodsworth and himself; as well as to the history of the antient nobility of the realm, and of which he afterwards made much use in his 'Baronage.'

After the surrender of Oxford upon Articles, Dugdale, having the benefit of them, and having compounded for his estate, went to London; where he and Dodsworth proceeded vigorously in completing their collections from the Tower Records and Cottonian library. A short absence from England in 1648, when he attended lord and lady Hatton to Paris, enabled him to improve his and Dodsworth's collections with notices and charters relating to the Alien Priors of England, from the papers of Andrew Du Chesne. When their collections were ready, the booksellers, declining to venture upon so large and hazardous a work, Dodsworth and Dugdale printed the first volume at their own charge, which was published in 1655, in folio, under the title of 'Monasticon Anglicanum,' adorned with the views of abbeys, churches, &c. The second volume was published in folio, in 1661. These two volumes were collected, and chiefly written by Dodsworth; but Dugdale took great pains in methodizing and disposing the materials, in making several indexes to them, and in correcting the press. Dodsworth died in August, 1654, before the tenth part of the first volume was printed off. A third volume was published in 1673.

From an entry in his diary, as early as 1658, Dugdale appears to have feared that a translation of the 'Monasticon' would have been published by Mr. King, probably Gregory King, at that time his clerk. That such a one was prepared, as far as the first volume was concerned, is evident, since Dugdale describes it as 'erroneously Englished in a multitude of places.' The translation, however, or rather the epitome, which was subsequently printed, did not appear till 1692, six years after Sir William Dugdale's death. The dedication to William Bromley, Esq., is signed J. W. It is ascribed to James Wright, who, in 1684, published the 'History and Antiquities of the County of Rutland.' Another epitome, by an anonymous writer, was published in 1718: but believed to have been by Captain John Stevens, who, in 1722 and 1723, published two additional volumes to the 'Monasticon,' which, besides an abundance of additional information in English, contained a very large collection of new charters, together with the History of the Friaries, to which no place had been assigned in the volumes published by Dugdale. The Rev. Samuel Peck, in 1735, promised a fourth volume of the 'Monasticon,' which was never completed. His collections for it are in the British Museum.

An improved edition of the 'Monasticon' was undertaken in 1812 by the Rev. Bulkeley Bandinel, D.D., keeper of the Bodleian library at Oxford, who soon relinquished his task to two other gentlemen who had been called in as coadjutors, John Caley, Esq., of the Augmentation Office, and Henry Ellis, Esq., keeper of the MSS. in the British Museum. An account of each religious house, in English, was prefixed to its respective series of Latin charters, and many new materials from leiger-books, rolls, and other documents were added, including all that was valuable in Stevens's volumes, with the history of several hundred religious foundations which were unknown to Dugdale. The chief of the prints, by Hollar, which ornamented the original edition, were re-engraved, and above 200 plates of churches and monasteries added, from drawings made exclusively for the work. This new edition was completed in 1830, in six volumes folio, the last volume divided into three parts.

In 1656 Dugdale published, at his own charge, 'The Antiquities of Warwickshire, illustrated from Records, Leiger-books, Manuscripts, Charters, Evidences, Tombs, and Armes, beautified with Maps, Prospects, and Portraitsures,' folio, Lond.: this is one of the very best of our county histories. A second edition was published, in two volumes folio, in 1730, revised and augmented by William Thomas, D.D.; and a third was contemplated a few years ago, and large preparations made for it, by the late William Hamper, Esq., of Birmingham. While this work was printing, Dugdale remained in London, during which time he had an opportunity of collecting materials for another work, which he published in 1658, 'The History of St. Paul's Cathedral, in London,' folio. A second edition of this work, enlarged, was published in 1716, in folio, by Edward Maynard, D.D., rector of Boddington in Northamptonshire; and a third, in 1818, by Henry Ellis, Esq. The plates of the original editions, both of the Warwickshire and the St. Paul's, were by Hollar. To the two last editions of the St. Paul's a life of Dugdale was prefixed.

Upon the restoration of King Charles II., through Lord

Chancellor Hyde's recommendation, Dugdale was advanced to the office of Norroy King of Arms. In 1662 he published 'The History of Imbanking and Drayning of divers Fenns and Marshes, both in Foreign Farts and in this Kingdom, and of the Improvements thereby,' fol. Lond. 1662: a second edition of which, revised and corrected by Chas. Nalson Cole, Esq., appeared in fol. Lond. 1772. This work was written at the desire of the Lord Gorges, Sir John Marsham, and others, who were adventurers in draining the great level which extends itself into a considerable part of the counties of Cambridge, Huntingdon, Northampton, Norfolk, and Suffolk. [BEDFORD LEVEL.] About the same time Dugdale completed the second volume of Sir Henry Spelman's 'Councils,' which was published in 1664 under the title of 'Concilia, Decreta, Leges, Constitutiones in Re Ecclesiarum Orbis Britannici, &c., ab Introitu Normannorum, A.D. 1066, ad Exutum Papam, A.D. 1531. Accesserunt etiam alia ad Rem Ecclesiasticam spectantia,' fol. Archbishop Sheldon and Lord Clarendon, who were the great encouragers of this labour, likewise employed Dugdale to publish the second part of Sir Henry Spelman's 'Glossary.' Having revised the first part, which had been published in 1626, and arranged the materials of the second, both were printed together in 1664 under the title of 'Glossarium Archaeologicum, continens Latino-barbara, Peregrina, Obsoleta, et Novæ Significationis Vocabula.' The second part, digested by Dugdale, began with the letter M. There was another edition of this work in 1687.

In 1666 he published, in folio, 'Origines Juridicales; or, Historical Memoirs of the English Laws, Courts of Justice, Forms of Trial, Punishment in Cases Criminal, Law Writers,' &c. &c., with portraits of several of the judges, and some other plates. A second edition was published in 1671, and a third in 1680. The first volume of 'The Baronage of England' appeared in 1675, and the second and third in 1676, folio. Upon this work he had spent thirty years of labour; and though the corrections to be made in it are numerous, it still remains one of the best works which exist as a foundation of English history. [BARONAGE.]

In May, 1677, Dugdale was created Garter King of Arms, and the day after received from his Majesty the honour of knighthood, much against his will, on account of the smallness of his estate. In 1681 he published 'A short View of the late Troubles in England, briefly setting forth their Rise, Growth, and Tragical Conclusion,' folio. This is the least valued of his publications. He published also, at the same time, 'The Antient Usage in bearing of such Ensigns of Honour as are commonly called Arms,' &c., 8vo., a second edition of which, with large additions, was published in the beginning of the year following; and a third edition, edited by T. C. Banks, Esq., folio, London, 1811.

The last work which Dugdale published was 'A perfect Copy of all Summons of the Nobility to the Great Councils and Parliaments of this Realm, from the 49th of king Henry III. until these present times,' folio, London, 1685. A facsimile, with the original date of this work, was printed at Birmingham between forty and fifty years ago.

This industrious man died at Blythe Hall, February 10th, 1686, in his eighty-first year, in consequence of a cold; and was interred at Shustoke. His epitaph in Latin, written by himself, is inscribed upon a tablet near the spot of his interment.

An account of Dugdale's manuscript collections remaining in the Ashmolean Museum at Oxford, and in the possession of his descendant, the late Dugdale Stratford Dugdale, Esq., at Merevale in Warwickshire, will be found appended to his *Life, Diary, and Correspondence*, edited by William Hamper, Esq., 4to., London, 1827, whence the principal particulars of the present life have been obtained. (See also the life prefixed to the last edition of the *History of St. Paul's*; and Chalmers's *Biogr. Dict.*, vol. xii., pp. 420-427.)

DUGONG. [WHALES.]

DUICKERBOK. [ANTELOPE, vol. ii., p. 81, species 30.]

DUISBURG, a circle in the northern part of the great administrative circle of Düsseldorf in Rhenish Prussia, about 252 square miles in area, and containing 8 towns, 1 market-town, 14 villages, and 3 hamlets, with a population of about 76,500 inhabitants: an increase of 17,150 since 1817. The Rhine is the western and the Lippe the northern boundary. It possesses rich coal-mines, and has 108,550 acres of fine arable land, and 27,720 of meadows and pastures: grain, tobacco, rapeseed, flax, hemp, hops, linseed, &c. are raised.

DUISBURG, the chief town, lies on the Ruhr and Angerbach, not far from the right bank of the Rhine, which once washed its walls; in 51° 26' N. lat., and 6° 46' E. long. It is said to have received its name from the Tuisconi or Teutones, who had a camp on this spot: in the time of the Romans it was denominated the *Castrum Deusonia*. The town is surrounded by walls and decayed towers on one side, and by a rampart and ditches on the other, and is situated in a fertile and agreeable country. The number of houses is about 700, and of inhabitants about 5500: in 1784 the number of the one was 682, and of the other 3531: the population has therefore increased about 1969 during the last fifty-two years, or upwards of one per cent. yearly on the average. Duisburg contains a gymnasium founded in 1599, an orphan asylum and hospital, endowed almshouses, a monastery of Minorites, and five churches, of which that of John the Baptist dates from the year 1187, and that of St. Salvator, on the tower of which once stood an observatory, from 1415; two of them are Roman Catholic, and the others Protestant. It was the site of a Protestant university, founded in 1655 and abolished in 1802. There are considerable manufactures in the town, particularly of woollen-cloth, cottons, stockings, hats, woollen coverlids, velvet, soap, starch, and leather; and an extensive traffic with the Westphalian provinces in wine and colonial produce, grain, and cattle. In the neighbourhood there are two iron-works, where large quantities of cast-iron are made. The Duisburg forest, mentioned by Tacitus (*Annal.* i. 60), under the name of the *Saltus Teutoburgensis*, is in the vicinity.

DUKE. The title given to those who are in the highest rank of nobility in England. The order is not older in England than the reign of king Edward III. Previously to that reign those whom we now call the nobility consisted of the barons, a few of whom were earls. Neither baron nor earl was in those days, as now, merely a title of honour; the barons were the great tenants in chief, the earls important officers in the community. It does not appear that in England there was ever any office or particular trust united with the other titles of nobility, viscount, marquis, and duke. They seem to have been from the beginning merely honorary distinctions. They were introduced into England in imitation of our neighbours on the continent. Abroad however the titles of duke and marquis had been used to designate persons who held no small political power, and even independent sovereignty. The czar was duke of Russia or Muscovy. There were the dukes of Saxony, Burgundy, and Aquitaine: persons with whom the earls of this country would have ranked, had they been able to maintain as much independence on the sovereign as did the dukes on the continent of the Germanic or the Gallic confederacy. An important officer during the lower empire had the title of dux, which is probably the origin of the modern duke or doge in every country of Europe. [DOGS.]

The first person created a duke in England was Edward Prince of Wales, commonly called the Black Prince. He was created duke of Cornwall in parliament, in 1335, the eleventh year of king Edward III. In 1350, Henry, the king's cousin, was created duke of Lancaster, and when he died in 1361, his daughter and heir having married John of Gaunt, the king's son, he was created duke of Lancaster, his elder brother Lionel being made at the same time duke of Clarence. The two younger sons of king Edward III. were not admitted to this high dignity in the reign of their father: but in the reign of Richard II., their nephew Edmund was made duke of York, and Thomas duke of Gloucester.

The dignity was thus at the beginning kept within the circle of those who were by blood very nearly allied to the king, and we know not whether the creation of the great favourite of king Richard II., Robert Vere earl of Oxford, duke of Ireland, and marquis of Dublin, is to be regarded as an exception. Whether, properly speaking, an English dignity or an Irish, it had but a short endurance, the earl being so created in 1385 and attainted in 1388.

The persons who were next admitted to this high dignity were of the families of Holland and Mowbray. The former of these was half-brother to king Richard II.; and the latter was the heir of Margaret, the daughter and heir of Thomas de Brotherton, a younger son of king Edward I., which Margaret was created duchess of Norfolk in 1358. This was the beginning of the dignity of duke of Norfolk, which is still existing, though there have been several for-

feitures and temporary extinctions. Next to them, not to mention sons or brothers of the reigning sovereign, the title was conferred on one of the Beauforts, an illegitimate son of John of Gaunt, who was created by king Henry V. duke of Exeter. John Beaufort, another of this family, was made duke of Somerset by king Henry VI.

In the reign of Henry VI. the title was granted more widely. There were at one time ten duchesses in his court. The families to whom the dignity was granted in this reign were the Staffords, Beauchamps, and De la Poles. In 1470, under the reign of Edward IV., George Nevil was made duke of Bedford, but he was soon deprived of the title, and Jasper Tudor was made duke of Bedford by his nephew king Henry VII. in the year of his accession.

King Henry VIII. created only two dukes, and both were persons nearly connected with himself; one being his own illegitimate son, whom he made duke of Richmond, and the other Charles Brandon, who had married the French queen, his sister, and who was made by him duke of Suffolk. King Edward VI. created three: viz., his uncle, Edward Seymour, the Protector, duke of Somerset (from whom the present duke of Somerset derives his descent, and, by reversal of an attainder, his dignity), Henry Grey, duke of Suffolk, and John Dudley, duke of Northumberland. The struggles of these three great peers proved the ruin of all and the extinction of their dignities.

Queen Elizabeth found on her accession only one duke, Thomas Howard, duke of Norfolk, attainder or failure of male issue having extinguished the others. He was an ambitious nobleman, and aspiring to marry the queen of Scotland, Elizabeth became jealous of him: he was convicted of treason, beheaded, and his dignity extinguished in 1572; and from that time there was no duke in the English peerage except the sons of king James I., till 1623, when Ludovick Stuart, the king's near relative, was made duke of Richmond, which honour soon expired. In 1627 George Villiers was created duke of Buckingham, and he and his son were the only dukes in England till the civil wars, when another of the Stuarts was made duke of Richmond, and the king's nephew, best known by the name of prince Rupert, duke of Cumberland.

We see how choice this dignity was regarded down to the reign of king Charles II. In the first year after his return from exile, that prince restored the Seymours to their rank of dukes of Somerset, and created Monk, the great instrument of his return, duke of Albemarle. In 1663 he began to introduce his illegitimate issue into the peerage under the title of duke, his son James being made in that year duke of Monmouth. In 1664 he restored to the Howards the title of duke of Norfolk, and in 1665 created a Cavendish, who had held a high military command in the civil war, duke of Newcastle. In 1682 he created the marquis of Worcester duke of Beaufort. As for the rest the dignity was granted only to issue of the king or to their mothers. The only duke created by king James II. was the duke of Berwick, his natural son.

Of the families now existing, beside those who descend of king Charles II., only the Howards, the Seymours, and the Somersets date their dukedoms from before the Revolution. The existing dukedoms originally given by Charles II. to his sons are Grafton, Richmond, and St. Albans. Under king William and queen Anne several families which had previously enjoyed the title of earls were advanced to dukedoms, as Paulet duke of Bolton, Talbot duke of Shrewsbury, Osborne duke of Leeds, Russell duke of Bedford, Cavendish duke of Devonshire, Holles duke of Newcastle, Churchill duke of Marlborough, Sheffield duke of Buckinghamshire, Manners duke of Rutland, Montagu duke of Montagu, Douglas duke of Dover, Gray duke of Kent, Hamilton duke of Brandon; besides members of the royal family and Marshal Schomberg, who was made an English peer as duke of Schomberg. This great accession gave an entirely new character to the dignity. King George I. followed in the same policy, giving us, besides the dukedoms in his own family, Bertie duke of Ancaster, Pierrepont duke of Kingston, Pelham duke of Newcastle, Bentinck duke of Portland, Wharton duke of Wharton, Brydges duke of Chandos, Campbell duke of Greenwich, Montagu duke of Manchester, Sackville duke of Dorset, and Egerton duke of Bridgewater. George II. adopted a different policy: he created no duke out of his own family, and the only addition he can be said to have made to this branch of the peerage was by enlarging the

limitation of the Pelham dukedom of Newcastle so as to comprehend the Clintons, by whom the dukedom is now possessed. From 1720 to 1766 there was no creation of an English duke except in the royal house. In that year the representative of the antient house of Percy was made duke of Northumberland, and the title of duke of Montagu, which had become extinct, was revived in the Brudenels, the heirs. The same forbearance to confer this dignity existed during the remainder of the reign, and during the reign of George IV., no dukedom being created out of the royal house, till the eminent services of the duke of Wellington marked him out as deserving the honour of the highest rank which the king has it in his power to confer. His dukedom was created in 1814, forty-seven years after the creation of a duke of Northumberland. The marquis of Buckingham was advanced to the rank of duke of Buckingham and Chandos in 1822, so that for a hundred years, namely from 1720 to 1822 only four families were admitted to this honour.

During the reign of William IV. two dukedoms have been created, Gower duke of Sutherland, and Vane duke of Cleveland.

The whole number of dukes in the English peerage is at present twenty-one, exclusive of the blood royal. There are seven Scottish dukes, two of whom are also English dukes. The only Irish duke is the duke of Leinster.

All the dukes of England have been created by letters patent in which the course of succession has been plainly pointed out. Generally the limitation is to the male heirs of the body.

DUKER, CHARLES ANDREW, a distinguished scholar, born at Unna in La Marck, in the year 1670. He studied first at Hammon, and afterwards, under Perizonius, at Franeker. About the year 1700 he became professor of history and eloquence at Herborn, in Nassau, which he exchanged, four or five years afterwards, for the place of under-master in the school at the Hague. On the death of Perizonius, in 1716, the Greek chair in the university of Leyden became vacant, and was offered to Burmann, who accepted it, and thereby vacated the professorship of history and eloquence which he held at Utrecht, and which was divided between Duker and Drakenborch, Burmann's pupil and friend. In 1734 Duker gave up his professorship and retired to the country. He died at Meydéric on the 5th of November, 1752. Duker is best known by his edition of Thucydides, published at Amsterdam 1731 (fol.), which was, till Bekker's appeared in 1821, by far the best edition of that author. The great care and labour which he bestowed upon this work made Schröder call him *Varilectionarius Thucydidæus* (*Præf. ad Senec. Tragædias*). Duker also edited Florus in 1722, and contributed to the edition of Livy published by his colleague Drakenborch, to the 'Origines Babylonice et Egyptiacæ' of his friend Perizonius, and to other works. All his notes are sensible and accurate; but it has been remarked that in his Thucydides in particular he has been rather capricious in choosing passages for illustration, and has omitted explanations in the very places where they were most necessary.

DULCIMER, a very antient musical instrument, and not yet entirely fallen into disuse. There seems to be little doubt of this being the psaltery, psalterium, or nebel, of the Hebrews. In shape it was sometimes a triangle, sometimes a trapezium, as appears from Luscinius, Kircher, and Blanchinus, a fact overlooked by Sir John Hawkins, who argues, in opposition to Kircher, that the instrument took different names according to its different forms. The Dulcimer, as now used by street-musicians, to whom it is confined, is a trapezium in shape, has many strings, two to each note, and is struck by a pair of sticks with wooden or metallic knobs. The tone much resembles that of the old spinnet, and in skilful hands the instrument is of rather an agreeable kind. [CITOLE.]

DULVERTON. [SOMERSETSHIRE.]

DULWICH. [ALLEN; BOURGEOIS.]

DUMBARTON, or **DUNBARTON**, the chief town of Dumbartonshire, in Scotland, is an antient royal burgh, and was in very early times the head town of the earldom of Lennox. It is situated at the confluence of the Leven with the Clyde, about 14 miles west-north-west from Glasgow and 52 west from Edinburgh.

The first charter granted to Dumbarton was that of Alexander II., in the beginning of the thirteenth century; this charter, as well as those of several succeeding monarchs,

was confirmed by James VI. in 1609, and ratified by Parliament in 1612. The revenue of the burgh is about 1,030*l* per annum, but the expenditure generally exceeds that sum. Two burgh courts are held weekly. Dumbarton is in schedule (E) of the Scotch Reform Act (2 & 3 Will. IV. c. 65), and returns one member to Parliament, jointly with Renfrew, Rutherglen, Kilmarnock, and Port-Glasgow. The population in 1831 was 3623. There is a school, under the patronage of the magistrates, superintended by two teachers.

The castle stands on a steep rock, rising up in two points, and inaccessible on every side, except by a very narrow passage, fortified with a strong wall or rampart. Within this wall is the guard-house, with lodgings for the officers, and from hence a long flight of stone steps leads to the upper part of the castle, where there are several batteries mounted with cannon, the wall being continued almost round the rock. There are the remains of a high gateway and wall, the top of which has a bridge of communication from one summit of the rock to the other. There is also an excellent well constantly supplied with water. The rock on which the castle stands is nearly surrounded with water, and forms a highly interesting view from the Clyde, whose waters wash its base. Considered as the key to the Western Islands, this castle was always a great object of contention, and has sustained many memorable sieges. It is now garrisoned by some invalids, under the command of a governor and some subaltern officers. In the upper part, where the rock divides, convenient barracks have been erected, as well as a small arsenal, containing Wallace's gigantic sword and many other curiosities.

DUMBARTONSHIRE, a small maritime county in the west of Scotland, between 55° 53' and 56° 20' N. lat., and 3° 50' and 4° 50' of W. long. It consists of two separate parts, having an intervening distance of six miles between their nearest approaching points. The larger and western part is bounded on the west by Loch Long, by which it is separated from the county of Argyle; the southern boundary is formed by the river Clyde, the eastern by the county of Stirling, and the northern by Perthshire. The ancient name of the county was Levenach, that is, county of the Leven, which subsequently became Levenax, and finally Lennox. It is about 36 miles in length from north-west to south-east, in a straight line, and in the middle about 15 miles in breadth from east to west. Loch Lomond is not wholly included within the county. The small detached eastern part is half enclosed by Stirlingshire on the north, and by Lanarkshire on the south, and measures 12 miles from east to west, and about 4 miles from north to south. The whole area of the county is 165,760 acres, or 259 square miles, of which 19,840 acres are water. In the western part the parishes are ten in number, namely, Dumbarton, Cardross, Roseneath, which is a peninsula formed by Loch Long and Gare Loch, Row, Arrochar, Luss, Bonhill, Kilmarnock, and West and East Kilpatrick. The eastern part is composed of two parishes, Kirkintilloch, and Cumbernauld. Two-thirds of the surface consist of mountains, partially presenting woods, mosses, and moors, and incapable of cultivation. The most remarkable are Ben Voirlich, Arrochar, Benequirach, Luss, Row, and Roseneath; the rugged and precipitous summits of which are frequently covered with snow and clouds. Ben Voirlich, in the northern extremity of the county, and near the northern extremity of Loch Lomond, is 3330 feet above the level of the sea, that is, above 100 feet higher than the adjacent Ben Lomond. There are many highly picturesque situations in this county. The contrast of sterile mountains and verdant glens is very striking. Loch Lomond, which covers about 20,000 acres, presents the richest description of lake and highland scenery. Its length is 22 miles; its surface is studded with many beautiful little islands, and its finely wooded shores are adorned with elegant villas. The climate is in general mild and very moist. Yet the lateness of the spring, the frequency of showers and cloudy weather during harvest, with blighting mountain winds in the spring and autumn, and the early commencement of winter, are insuperable disadvantages to agriculture; but for pasturage, and especially for the growth of timber, the climate is remarkably well adapted; nor is it unfavourable to health and longevity. The natural copse woods and plantations cover several thousand acres,

and consist of oak, ash, yew, holly, mountain-ash, birch, hazel, aspen, alder, crab, thorn, and willow. The comparative extent of arable land is very small; it is chiefly clay, and lies mostly on the south of Loch Lomond, and along the Clyde. The prevalent soils are clay, gravel, black loam, and a small portion of bog. Potatoes, oats, and wheat are the principal crops. The cattle are chiefly of the West Highland breed. From 12,000 to 17,000 are annually sold at the market on Carman Moor. Cows of the Ayrshire breed have been introduced into most of the dairy farms. The sheep are of the small black-faced mountain breeds. In 1811, at the time of the agricultural survey, the number was 28,000, but the general improvements in farming which have since been made in the county have greatly increased all kinds of stock and produce. Property is in few hands, and farms are of very various extent, but chiefly small. The principal mineral production is coal, of which there is a large field, but of inferior quality. About 11,000 tons are dug annually at Langfauld, in the southern extremity of the county (West division). Pyrites is procured in small quantities at the same place. In the Eastern division of the county about 3000 tons of ironstone are dug and conveyed on the Clyde and Forth canal to the great iron-foundry at Carron. Some large quarries of limestone are worked, and of white and red freestone. There are several slate quarries yielding annually about 80,000 slates, of which the greater portion is taken to Glasgow, along the rivers Leven and Clyde, and the Glasgow canal.

On the banks of the Leven are numerous and very extensive works for cotton-printing, and bleaching-fields; the pureness of the Leven water being peculiarly adapted for this process. This stream, which, with the exception of numerous mountain torrents, is the only one worthy of notice, runs rapidly a distance of about five miles from Loch Lomond to the Clyde at Dumbarton Castle, and is navigable for lighters. The value of salmon annually taken in the Clyde and Leven, and sent chiefly to Glasgow, is stated at 1000*l*. Fifty boats are employed in the herring fishery, which produces annually about 4600*l*. Some large iron works are established at Dalnotter; there are also extensive and prosperous manufactories of glass and paper. Dumbarton is the chief town, and the principal road is from thence to Glasgow. The valued rental of the county is 33,328*l*. Scotch. The population in 1831 was 33,211. The county sends one representative to parliament. (*Agricultural Survey*, by Whyte and Macfarlan, 1811; Mac Culloch's *Statistics of the British Empire*, 1837, &c.)

DUMBNESS. [DEAF AND DUMB.]

DUMFRIES, the capital of the county of Dumfries, and the seat of a presbytery and synod, is beautifully situated upon a rising ground on the east side of the river Nith, about nine miles from its influx into the Solway Frith. The river is navigable for ten or twelve miles, and vessels of 120 tons' burden can approach the town. Two bridges cross the river; one on a very ancient structure, supposed to have been begun by Devorgilla Douglas, mother of John Balliol, king of Scotland; the other was built in 1795. The town is 34 miles from Carlisle, 79 from Glasgow, and 71 from Edinburgh. The principal street is about three quarters of a mile in length, and, on an average, about 60 feet in breadth. Many of the other streets communicate with it at right angles. The public buildings and houses are chiefly of red freestone, and have a handsome appearance. The streets and shops are well lighted by gas. There are two parish churches, and eight chapels for dissenters. The ministers of the two churches have each a stipend of about 300*l*. a year. The stipends of the dissenting ministers amount to from about 100*l*. to 150*l*. each: 1000 families attend the two established churches, and about 700 the dissenting places of worship. Neither the churches nor chapels have any free sittings. A third church is about to be erected. St. Michael's church-yard contains a great number of interesting monuments; among which is an elegant mausoleum, erected by subscription to the memory of the poet Burns, whose remains are deposited in a vault beneath. A handsome piece of marble sculpture, executed by Turnelli, representing the genius of Scotland finding the poet at the plough, and throwing her inspiring mantle over him, adorns the monument.

In the middle of High Street is Mid Steeple, where the meetings of the town-council are held; and opposite to it is the Trades' Hall, for the meeting of the seven incorporated

trades. In 1706 a town-house was built. In 1807 a county gaol and court-house were erected, the latter of which is now converted into a bridewell. The present court-house is an elegant and commodious building, having a communication with the prison by a vaulted passage under the street. An academy stands in a large and spacious area. The theatre and assembly-rooms are neat and convenient buildings. On the south-east side of the town is an infirmary and lunatic asylum for this and the neighbouring county, founded in 1787: the annual expenditure is about 1200*l.*; the average number of patients about 30. There is also an hospital for aged persons and orphans, and a dispensary. A large and handsome lunatic asylum is now building by the widow of the late Dr. Crichton, of Friar's Carse. In Queensberry Square, which is in the centre of the town, a handsome Doric column was erected in 1780 to commemorate the virtues of Charles duke of Queensberry.

The prosperity of the town depends very much on the neighbouring country, there being no extensive manufactures. Hosiery, tanning, and basket-making, and also the manufacture of hats, clogs, and shoes, are carried on to a considerable extent. The only trade of importance is that of pork, of which many thousand carcases are sold annually during the season. The principal exports are wool, freestone, grain, potatoes, and live stock, particularly sheep. The imports are wood, wine, slate, lime, coals, and iron. The number of vessels belonging to the port of Dumfries, including the creek of Annan, amounts to about 84, the total burden of which is 5783 tons. About 16 or 18 of them are foreign vessels, chiefly employed in bringing timber from America. The others are coasters, plying to Liverpool and the ports of Cumberland. A steam-vessel plies weekly between this port and Liverpool. A market is held weekly on Wednesday. The town is governed by a provost, three bailies, dean and treasurer, 12 councillors, and seven deacons of trades, in all 25. The revenue of the town is about 2000*l.* annually.

Dumfries is a royal burgh, and unites with Annan, Lochmaben, Sanquhar, and Kirkcudbright, in returning a member to parliament. Besides the quarter-sessions, the circuit courts for the southern districts of Scot and are held here twice a year. The population of the burgh and parish in 1821 was 11,152; and in the census of 1831 there was an increase of 554. Since then the population is supposed to have decreased. The spasmodic cholera was very fatal here in 1832: 837 cases were officially reported, and of these 422 died. Maxwelltown, which is situated on the opposite side of the river, may very properly be said to form a part of Dumfries: together they contain about 13,000 inhabitants. The number of families in the parish of Dumfries is 2599, of which 248 are chiefly engaged in agriculture, and 1170 in trade, manufactures, and handicraft. The number of electors for the burgh in 1831 was 468. The poor are relieved on the plan recommended by the Rev. Dr. Chalmers. The funds are raised by voluntary contribution, and not by assessment. Visitors make advances to the poor, and meet once a week to receive back their advances from the treasurer and to deliberate as to applicants. In this way about 1500*l.* is expended annually. The name of Dumfries, it is supposed, was derived from the Gaelic words *dun*, a fortified hill, and *preas*, shrubs or brushwood. Although it is a town of great antiquity, there is no authentic record of an earlier date than the beginning of the thirteenth century, when a monastery was erected for Franciscan friars. In this monastery the Comyns were slain by Bruce, aided by Roger Kirkpatrick and James Lindsay, in 1305. For the convenience of this religious house, a bridge of thirteen arches was erected across the Nith: of these only seven now remain. A strong castle is said to have been founded here in the twelfth century, of which there is now not a vestige. Like most other towns, it was entered and guarded by four ports, independent of inferior gates. Some of these were constructed in the form of a portcullis, surmounted with a tower. Dumfries was twice burnt by the English; once in the middle of the thirteenth century, and again in 1536. Queen Mary and her privy council came here to ratify a peace with England in 1563. About two years afterwards, some disaffected noblemen raised a force, against which Mary advanced an army of 18,000 men. These nobles fled to England, and the castle soon surrendered.

In 1570 the town was taken and ransacked by the English

under the Earl of Essex and Lord Scrope. James V., in passing through the town in 1617, presented the trades of the burgh with a small silver gun, to be awarded from time to time to the best marksman. In 1706 the articles of union were burnt at the market cross by a party of Cameronians, who entered the town for this purpose, and were joined by many of the inhabitants. In 1745 the town suffered much from Prince Charles's army on its return from England. The view up the Nith is varied and beautiful, and the town has in its vicinity several neat villas and venerable buildings, among which Terregles, Dalswinton, Castle Dykes, Caerlaverock Castle, Lincluden Abbey, and Newabbey deserve particular mention. (*Picture of Dumfries and its Environs*, by John M'Diarmid, Esq.; *The New Statistical Account of Scotland*; *Communications from Dumfries*.)

DUMFRIESSHIRE is a southern county of Scotland, lying between 55° 2' and 55° 31' N. lat. and between 2° 39' and 3° 53' W. long. from London. It is bounded on the south by the Solway Frith and Cumberland, on the north by the counties of Lanark, Peebles, and Selkirk, on the east by Roxburgh, and on the west by Kirkcudbright and Ayr. Its form is irregularly ellipsoidal: the greater diameter, from Liddel Mount to Corsoncune Hill, measures about 50 miles; the lesser diameter, from the Solway to Loch Craig, about 32 miles. The circuit of the county, exclusive of the estuaries of the Nith, Lochar, Annan, and Sark, is about 174 miles. The superficial area measures 1263 square miles, or 808,320 English statute acres. The county was formerly divided into three districts, viz., Annandale, Eskdale, and Nithsdale, each comprehending a portion of territory which fell within the basins of the three rivers after which they are named; Esk on the east, Nith on the west, and Annan in the centre of the county. In 1831 the population was 73,770. Considerable numbers emigrate to America and other places.

Surface, Hydrography, and Communications.—The surface of the county is very irregular. About half of it is mountainous, a small part is on the sea-coast, and one-third midland, consisting of low hills, ridges, and vales.

Hartfell, the highest mountain in the county, is 3300 feet above the level of the sea; Lowther, near Leadhills, 3130; Black Larg, bordering on Ayrshire, 2890; Ettrick Pen, in Eskdale Moor, 2220; Queensberry Hill, 2140; Cairn Kinnow, near Drumlanrig, 2180; Wisp Hill, in Ewes, 1836; Holehouse Hill, 1500; Knockcraig, 1400; Langholm Hill, 1200; and Burnswark, 740 feet.

In the vicinity of Lochmaben are nine lakes or lochs, five of which are of considerable size. The ancient royal castle of that name stands upon a very narrow peninsula on the south-east side of the castle-loch, which is three miles in circumference. Some years ago a canal was projected between this lake and the Solway Frith, which, if executed, would be attended with incalculable advantages to the whole district of Annandale. It is asserted that sixteen different kinds of fish fit for the table are found in the lakes of Lochmaben, and that the Vendace, a very delicious fish, which in appearance bears some resemblance to the herring, is peculiar to the large lake. The mountain lake called Loch Skeen, situated near the head of Moffat Water, is 1300 ft. above the level of the sea, and about 2 miles in circumference. This lake feeds the well-known cascade called the Gray Mare's Tail, and is well stocked with delicate trout of a large size. There are several other lochs or lakes of less extent.

The principal rivers in the county are the Nith, Annan, and Esk. The Nith enters the county from Ayrshire, and runs in a south-east direction, in a very winding course above 40 miles, passing Sanquhar, Thornhill, and Dumfries. About nine miles below the last-mentioned place it falls into the Solway Frith. The surrounding mountains and ridges approach near each other above Drumlanrig castle, and also near Blackwood, and divide the vale of the river into three portions, which have been named the vale of Sanquhar, the vale of Closeburn, and the vale of Dumfries. The tributary streams that join the Nith are the Clouden, Scarr, Shinnel, Cample, Carron, Menoch, Euchar, Cra-wick, and Killoe. Its banks are almost everywhere beautified with gentlemen's seats and pleasure-grounds.

The Annan takes its rise near the sources of the Clyde and Tweed, among the mountains near the junction of

Lanarkshire and Peeblesshire with this county, and runs a course nearly south of about 30 miles, in which it passes Moffat, Lochmaben, and Bridekirk. It enters the Solway a little below the royal burgh of Annan, the second town in the county. The tributary streams that flow into the Annan are the Mein, Wamphray, Evan, Milk, Dryfe, Kinnel, Ae, and Moffat. A beautiful ridge crosses the vale of this river from Kirkwood by Murraythwaite to Mount Annan. In the bed of the Kinnel is a rock called Wallace's Leap, near which place Wallace concealed himself after the battle of Falkirk. In the other tributary streams are several cascades, well known for the grandeur of the scenery which surrounds them.

The Esk rises in the mountains on the borders of Selkirkshire, runs in a southern direction above 30 miles in the county, passes Langholm and Canobie, and forms near the latter place for one mile the boundary with England; after which it enters Cumberland, and turns westward through an open country by Longtown into the Solway Frith. This river receives in its course the Liddel, Tarras, Wauchope, Ewes, Meggot, and Black Esk. In the vale of Esk is some romantic and picturesque scenery, especially between Langholm and Longtown, where there is one of the most beautiful carriage-drives in the kingdom. The Kirtle is a romantic little river that enters the Solway Frith a little distance from the Sark, which is a border stream, and forms the boundary between England and Scotland for some distance before it enters the Solway. Both these rivers rise from the hills in the neighbourhood of Langholm, and pursue a southern course of about 20 miles.

The Lochar is a moss rivulet, which rises in Tinwald parish, near a small village called Jericho, runs about 13 miles in a very serpentine course, and discharges itself direct into the Solway, a few miles east of the mouth of the Nith.

The larger rivers contain salmon, herlings, parr or samlet, and sea-trout. These, and also flounders and cod, and occasionally turbot, soles, and herrings, are taken in the Solway Frith. Along the shore considerable quantities of cockles and mussels are gathered by the poor people. The smaller rivers contain pike, perch, trout, and eels. Fishing for salmon, gillse, and sea-trout, whiting or herling, commences in the Annan and Nith on the 10th of March, and closes on the 25th of September, both of which times are generally considered a month too early. The fisheries of all the rivers of Dumfriesshire are much injured by stake-nets in the Solway, and by salmon being killed in the spawning season.

Game-birds of various kinds are very plentiful, particularly pheasants, black game, grouse, and partridges. The woodcock, curlew, plover, lapwing, and snipe are also abundant. Moor-fowl and ptarmigan shooting commences August 12th; heath-fowl August 20th; both terminate December 10th. Partridge-shooting commences September 1st, and that of pheasants October 1st; both end February 1st. Hares are numerous in many places, nor is the fox a stranger to the county; but neither the red deer nor the capercaille, both of which were met with at one time in Dumfriesshire, are now in existence. In some of the mosses are found the remains of the roe, or forest-deer, which formerly abounded in the county; but none had been seen for many years until lately, when two or three were discovered at Raehills, and having been protected, they are now established in considerable numbers. They are supposed to have strayed from the hills of Lanarkshire.

Roads.—There are no public railroads or canals; but the county is intersected in almost every direction with turnpike and other roads. The Carlisle and Glasgow turnpike enters the county at Sark Bridge, passes through Gretna, Dornock, Annan, Dumfries, Thornhill, and Sanquhar. Another turnpike to Glasgow passes through Gretna, Ecclefechan, Lockerby, Dinwoodie Green, and Beattock Bridge. A line of road leads from Carlisle towards Portpatrick by Annan and Castle Douglas. A turnpike-road extends from the town of Dumfries to Edinburgh by Moffat. The roads in general have of late been much improved, and are kept in excellent order. Safe and easy communications have been opened through several parts of the mountainous districts. A continuation of the projected railway from Manchester to Lancaster through Cumberland and Dumfriesshire to Glasgow would be an immense advantage and accommodation to the populous and manufacturing towns as well as to the agricultural districts on the line.

P. C., No. 555.

Geological Character.—The southern and lower part of the county consists of reddish-coloured sandstone, which becomes of a lighter colour and harder quality towards the north. This may be considered a continuation of the red marl formation of Cumberland. Proceeding farther northward, a reddish-coloured limestone, succeeded by a coarse white sandstone and blue limestone appears, and after these mandelstone rock and primitive mountains containing metallic ores. Limestone is worked in each of the three dales of the county, particularly at Kelhead in Annandale, and Closeburn in Nithsdale. A very remarkable appearance, and one that has excited considerable interest and speculation among geologists, was observed in a sandstone quarry in the parish of Lochmaben: distinct foot-marks of animals of various sizes were discovered, some of them 45 feet below the surface. The coal-field in the west of Cumberland is supposed to stretch through the Solway Frith towards the shores of Galloway and Dumfries, and to be buried at a great depth under the red strata of the shores and valleys of Nithdale and Annandale. The coal-metals appear forced out near Ecclefechan, Kirtle-town, and Canobie. Several unsuccessful trials by boring have been made in the low country, but never to a satisfactory depth, and coals are wrought only at the two extremities of the county, Sanquhar and Canobie. The former has probably no connexion with the coals of Cumberland, but is a part of the Ayrshire coal. A great portion of the county is supplied with coal from Cumberland, and from Lanarkshire and Ayrshire. The old red sand-stone appears in the bed of the Annan, near Jardine-hall.

At Wanlockhead, near Leadhills, are extensive lead-mines. During the last fifty years, 47,420 tons of lead have been raised. From this lead silver is extracted in the proportion of six to twelve ounces in the ton. Some pieces of lead ore have been met with in the parishes of Langholm, Johnstone, Penpont, and St. Mungo, but no mines are wrought there. Gold is occasionally found in the mountains at Wanlockhead, in veins of quartz, or washed down into the sand of the rivulets. In the reign of queen Elizabeth, 300 men were employed by Sir Bevis Bulmer, for several summers, and collected gold to the value of 100,000*l*. Within the last four years two pieces have been found which weighed respectively ninety and sixty grains. The largest piece ever found there is in the British Museum, and weighs four or five ounces. An antimony mine, discovered at Glendinning in 1760, was regularly wrought in 1793. The ore was a sulphuret, which yielded about 50 per cent. The vein seldom exceeded twenty inches in thickness, and contained blende, calcareous spar, and quartz. Copper ore and manganese have been met with in small quantities; the former in the parish of Middlebie. Iron-stone exists in some places in spheroidal masses, and in beds and bogs, but no iron is worked from ores in the county. Gypsum occurs in thin veins. The rocks of many of the hills consist of greenstone and of greywacke, and greywacke slate. Floots-trap is found on the summit of some of the mountains, and generally in the shape of mountain caps. Boulders of granite and sienite are found in various places, the latter most frequently in the low part of the county. There are several basaltic or whinstone rocks, the finest of which are met with in the mountains in the vicinity of Moffat. About a mile from the last mentioned place is a celebrated mineral water similar to the sulphureous water of Harrowgate, and about five miles distant, in a deep ravine on the side of Hartfell, is a chalybeate spring. There are also mineral waters in the neighbourhood of Langholm, Annan, and Lochmaben, and in some other parts of the county.

Climate.—That part of the county which adjoins the Solway Frith is low and warm. The mountainous district is cold and bleak, but seldom remains long covered with snow. The whole is supposed to be moist, and in general mild and salubrious. In summer and autumn the prevailing winds are from the west and south, and in the winter and spring from the east and north. In winter the cold is sometimes moderate, at other times severe. The spring is generally late. In summer the thermometer often stands above 70° of Fahrenheit, and has been observed as high as 92° in the shade. About 45° is considered the average annual temperature. The most dreadful snow storm on record occurred in 1794, on the 25th January; upwards of 4000 sheep, besides a number of black cattle, were destroyed by it. As much of the land is wet and destitute of

Vol. IX.—a C

shelter, the climate would be greatly improved by draining and planting. Wood is much wanted in the county, particularly on the higher ridges, both for use and ornament; and draining would be a most important improvement. At a moderate expense not only Lochar moss, but several other extensive tracts of wet and mossy ground might be drained and converted into valuable meadows and corn-fields. There are a few belts and clumps of trees, and young plantations which are thriving well, but their extent is very limited.

Agriculture.—The soil in the lower parts of the county is generally light and sandy. Along the margins of the great rivers are considerable tracts of rich alluvial soil. Between Tinwald and Torthorwald, and from the Hook to Lockerby are fine fields of loam; peat-moss prevails on many of the hills, and in some of the vales: the most extensive moss is that of Lochar, near Dumfries, which is eleven or twelve miles long, and between two and three broad. Clay is found extensively as a sub-soil, and in a few places as a soil mixed with other substances. In Annandale and Nithsdale the dry soil prevails. On many of the hills the soil is naturally wet. Many of the estates are freehold, and are held immediately of the crown. A considerable number are held of a subject superior. Lands of both tenures may be laid under entail for an unlimited period, and in favour of heirs yet unborn. As the right of superiority may be conveyed without property, some gentlemen hold superiorities who have no property in the county. In the vicinity of the castle of Lochmaben small parcels of rich and fertile land called Four Towns are held by a very ancient and peculiar mode of kindly tenure, and are transferred simply by possession. The proprietors pay a small fixed sum annually to the earl of Mansfield. Feu-holding, which enables the owner to alienate at pleasure, and subjects him to an annual payment equal and sometimes superior to rack-rent, is mostly confined to houses and gardens. Near the royal burghs certain tracts of land are held under burghage tenure. The owners of these pay every year a certain sum as rent or duty to the magistrates of the burghs. Tithes, or teinds, as they are called, are very light. By an act of the Scottish parliament, dated 1663, a fifth part of the rent was directed to be returned as the tithe, and fixed as a money payment; the valuations to be made at the request of the landowners. In consequence of the depreciation of money and the increase of the value of land, the tithes are considered exceedingly moderate. The rental of a great portion of land has been more than doubled within the last forty years. Though several landlords have lately made considerable reductions, many farms, on account of the reduced price of produce, are over-rented, and for want of capital the farmers are unable to make improvements. Long leases of small portions of land for building are very common in villages. Farms of arable land are generally let on leases of 15, 19, or 21 years. On sheep farms the ordinary leases are from 9 to 13 years. Various forms of leases are in use. Some landowners have printed conditions, which are seldom read or attended to by the tenants, except so far as regards the rent and term of the lease. There is a kind of rule that not more than one third part of the arable land shall be under white crops, yet some adopt the four-field and others the six-field course of husbandry. A variety of crops are now cultivated, and the practice of farmers with respect to rotation is various. Some very judiciously endeavour to suit their rotation and course of management to the different soils; others, by altering the rotation or by varying the genera or species of the crops, adopt a double rotation. The following is a frequent order of husbandry: 1st year, oats; 2nd, potatoes and turnips, the latter fed off by sheep; 3rd, wheat or barley, and sown with grass seeds; 4th, hay; 5th, grass. Oats and potatoes are cultivated more extensively than any other crop, both for home consumption and for exportation. Potatoes are much used in fattening cattle and pigs. A great quantity of hams and bacon of the very best quality are cured in this county, and sent off to the Liverpool, London, and Newcastle markets. The very general adoption of the culture of turnips has lately been one of the greatest improvements in agriculture. Bone manure is used with advantage upon high ground of difficult access. The farm implements in use are very similar to those in Cumberland, with the exception of the sickle, the use of which is in some places much laid aside, and the scythe substituted for it. The horses in general are of a middle size, and are the result of many crossings of different

breeds. The quality of the cattle and sheep stocks has been lately much improved. The Galloway breed of cattle mostly prevails, except for the dairy, for which business many intelligent farmers prefer cows of the Ayrshire breed. The sheep are of the Cheviot and black-faced breeds, but there are not many of them perfectly pure and unmixed. Latterly they have been crossed by the Leicesters, and where the land has been drained, which is usually by open cuts, the offspring are found to answer exceedingly well, and make more profitable returns to the farmer. The native breed of dun-faced small sheep does not now appear in the county. A great number of pigs are kept by the farmers and cottars, and bacon may be considered a staple commodity of the county. Grass lands are generally entered upon at Whitsuntide; and corn lands in August, after the removal of the crop. The rent is payable at Whitsuntide and Martinmas in equal portions. Sheep farms vary in size from 300 to 3000 acres, and two sheep for three acres may be considered an average number of stock. The management of these is by far the least expensive branch of farming, though a good deal more is necessary than the shepherd and his dog. Arable farms extend from 50 to 600 acres; many are about 100 or 150 acres. Some farms contain both sheep-walk and arable lands, and these are considered the most convenient and productive. Arable farms, and those of small size, prevail on the low grounds and near the market towns and villages. Those of larger extent, where pasture greatly preponderates, are more distant, and more highly situated. The rent of land varies according to quality and situation. Arable land in a good situation lets from 2*l.* to 5*l.* per acre, but about 1*l.* per acre may be considered an average of the county for arable lands, and 4*s.* for sheep-walk. The annual value of real property, as assessed in 1815, was 295,621*l.*

Most of the modern farm buildings are commodious and well arranged; they are constructed of stone and lime, and generally covered with slate. Very few are now thatched with straw or built of clay as formerly. Great improvements have been also made in the churches, schools, roads and fences. There are two or three district farming societies, but no general agricultural association for the county. These societies have been very useful by stimulating attention to the improvement of stock. The present depressed state of agriculture bears hard on the peasantry, who are intelligent, frugal, and industrious people. A remarkable difference exists in the food provided by the farmers in England and in Dumfriesshire for their labourers. In Dumfriesshire the haymakers, reapers, &c. have oatmeal porridge, milk, potatoes, and broth, but no meat except a piece of bacon boiled in the broth to give it a relish. The gray plaid thrown round the body is very common. The popular games are curling in winter, and quoits in summer. Married servants generally reside in a cottage near the farmer's house, and are furnished with a quantity of oatmeal, potatoes, and peats. They have also a cow's grass each, and supplies of money, the whole supposed to be worth about 35*l.* a year. House servants are engaged at hiring fairs at a fixed wage, for six months, for which period men have about 6*l.*, and women 3*l.* The people are very sensible of the benefits of education, and can almost all read and write. In the country parishes, as well as in burghs and larger villages, there are parish schools, in which not only the ordinary branches of education, but also the classics and French are generally taught. A few of them are well endowed, but the emoluments on an average do not perhaps exceed 50*l.* each. The poor in the country are relieved by the ministers and elders from funds collected in alms at the church doors, voluntary donations, and small fines. In many parishes sums of money have been bequeathed, or mortified, as it is termed, for the use of the poor. The great evil of this system is constant and uninterrupted public begging, the only remedy for which would be to enforce residence in the parishes where the poor are known. In a few parishes on the border a rate is levied, and paid in equal proportions by the landlords and tenants. The independent disposition which induced the poor to refrain from seeking parochial relief, it is feared, is fast wearing out. The practice of making salt by filtering the sea-sand, or sleetch, for which the inhabitants had a right of exemption, has altogether ceased along the coast since the removal of the salt duty.

Fairs.—The county town has three annually, for horses and black cattle, February 18th and September 24th, if

these days fall on Wednesday; if not, the Wednesday after; and Martinmas Wednesday. The last is chiefly for fat cattle, and for hiring servants. There are markets here also for cattle on Wednesdays, from the beginning of April to the end of December. For lambs: Langholm, July 26th; Lockerbie, August 16th and October 16th, excepting Saturday, Sunday, or Monday, and in that case on the Tuesday following. For sheep: Langholm, September 18th. For tups, sheep, lambs and wool: Sanquhar, July 17th, if Friday; if not, on Friday after. For tups: at Moffat in the latter end of June; at Annan in May and October; at Moffat in March and October; and at Lockerbie in April; and fourteen days after Michaelmas are fairs for hiring servants.

Formerly a very singular custom was observed at a fair held at the meeting of the White and Black Esks. At that fair, it was the custom for unmarried persons of both sexes to choose a companion according to their liking, with whom they were to live till that time next year: this was called *hand-fasting*. If they were pleased with each other at that time, they continued together for life; if not, they separated, and were free to make another choice as at first.

Divisions, Towns, &c.—There is no division of the county for political purposes, but within its limits are four royal burghs, Dumfries, Annan, Lochmaben, and Sanquhar. The natural division is into the districts or dales of the three principal rivers; Nithsdale, Annandale, and Eskdale.

Langholm is a well built town delightfully situated in the bosom of some picturesque woodland and mountain scenery on the banks of the Esk. It consists of one principal street, in which is a town-hall and jail in the market-place; and the village of New Langholm on the opposite side of the river. The castle, which is now in ruins, has only been a square tower. There is an old church, two dissenting meeting-houses, an endowed school, and a savings'-bank. The late Mr. Telford, civil engineer, left 1000*l.* to the Langholm library, and as there are two libraries, the legacy is in dispute between them. There are also two woollen manufactories and a small whiskey distillery. Wednesday is the market day. Parish population 2676. A handsome monument has lately been erected by subscription on Langholm Hill to the memory of the late Sir John Malcolm. The principal mansion-houses in the vicinity are Langholm-lodge, Broomholm, Burnfoot, and Westerhall. Near the old castle is a place where several reputed witches were burnt in the last century, some of whom, it is said, acted as midwives, and had the power of transferring the pains of labour from the mother to the father.

Moffat, a celebrated watering-place, stands on very dry and gravelly ground, which gently declines towards the south, near the river Annan, 20 miles north by east of Dumfries. It is protected on the north-east by a noble screen of lofty mountains. Here are elegant baths, assembly-rooms, a church and burgher meeting-house, a subscription and a circulating library. Parish population in 1831, 2221. A weekly market is held on Friday. The seat of Rae-hills is about eight miles distant. Among the places in the vicinity noted for fine scenery, and much visited by strangers for the purpose of recreation, are the old caves at Newton; Earl Randolph's tower; Craigie wood; Bellcraig rock and lin, and Gray Mare's Tail. The sulphureous water of Moffat, according to the analysis of Dr. Garnet, contains 4 cubic inches of nitrogen gas in the wine gallon, 5 cubic inches of carbonic acid gas; 10 cubic inches of sulphureted hydrogen gas; and 36 grains of sulphate of soda. The chalybeate water of Hartfell, according to the analysis of the same chemist, contains 5 cubic inches of azotic gas in a wine gallon; 84 grains of sulphate of soda, 12 grains of sulphate of alumina, and 15 grains of oxide of iron. The sulphureous water is found of great service in scrofula, cutaneous eruptions, and bilious complaints; the chalybeate in disorders of the stomach and bowels, and in those connected with local and general debility.

Lochmaben is a very antient burgh and market town seated on the west side of the Annan. It was several times plundered and burnt by the English. It consists chiefly of one broad street, and is governed by a provost, three bailies, a dean of guild, a treasurer, and nine ordinary councillors. The revenues are very small. The town-hall, under which is the jail and lockup-house, was built in 1745. A handsome and substantial new church was erected in 1819. It possesses also a burgher chapel, a subscription library, and an endowed school. Population 1000; 39 of whom are elec-

tors under the Reform Act. During the winter there is a weekly market for pork, in which business is done to a large amount. The castle, now in ruins, has been a place of great strength, the fortification covering nearly 16 acres.

Lockerbie is a market-town situated between the rivers Annan and Milk, 19 miles east of Dumfries. The number of inhabitants is 1414. There is a good parish church, and also an antiburgher meeting-house, a library, and a public reading-room. The old tower was lately converted into a temporary lockup-house. Thursday is the market day. The winter weekly markets are principally for pork.

Sanquhar, a royal burgh, is seated on the Nith, 27 miles south-west of Dumfries. It has a handsome church, erected in 1820, and three dissenting places of worship; a prison, savings'-bank, and a subscription library. The castle is a very picturesque ruin. The town is governed by a provost, three bailies, a dean of guild, a treasurer, and eleven ordinary councillors. Revenue about 40*l.* yearly. The only manufacture, except weaving and sewing of muslin to a certain extent, is a carpet manufactory at Crawick-mill. Parish population in 1831, 3268. The town about 1400. The number of electors of the burgh was 50. At Elicock-house, in this parish, was born the Admirable Crichton.

Ecclefechan is a neat village on the Glasgow and London road, on which a market is held every month on a Friday, and a pork market weekly. In its vicinity are Hoddam-castle, and the Tower of Repentance.

Graitney or Greta Green, a neat small village long celebrated for the clandestine marriages of fugitive lovers, is situated within a mile of the English border; on which border is also Solway-moss, remarkable for a disastrous battle in the time of Henry VIII., and for a sudden and overwhelming eruption that took place in 1771.

Divisions for Ecclesiastical and Legal purposes. The synod of Dumfries extends over the whole county, and also over a part of some other counties. It comprehends fifty-three parishes, forty-two of which are in this county. The next court in authority is a provincial synod, which consists of all the clergy of the established church, and one elder from each parish. The synod of Dumfries comprehends five presbyteries, viz. Dumfries, Lochmaben, Annan, Penpont, and Langholm. The number of clergymen within its limits is fifty-four, and of these forty-three are in this county. Prior to the year 1756, there were three jurisdictions in the county, viz. the sheriffship of Nithsdale, the stewardry of Annandale, and the regality of Eskdale. Since then one sheriff, whose authority extends over the whole county, has been deputed by the crown. He appoints a deputy; and holds office during life and good conduct. The sheriff-court for the county and the commissary court are held every Tuesday during the session; the sheriff small debt court every second Thursday throughout the year; and the justice of peace small debt court every second Monday.

The county sends one member to parliament, and the burghs of Dumfries, Annan, Lochmaben, and Sanquhar join with Kirkcudbright in electing another representative. Three newspapers are published weekly at Dumfries, the county town.

Antiquities, History, &c. The remains of Druidical temples exist in the parishes of Holywood, Graitney, Eskdalemuir, and Wamphray. Near Moffat are vestiges of a British encampment and also of a Druidical temple. A Roman way has extended from Carlisle by Graitney through the procestrium of the station at Burnswark. This way afterwards divided into two branches; one of which took the route of Nithsdale, and the other of Annandale. They united again at or near Crawford castle. Another Roman way led from Carlisle by the station at Netherby and Liddel-strength through Canobie into Teviotdale. Several fortifications, both of a circular and square form, and some large Roman encampments can be distinctly traced in various parts of the county. At Castleo'er or Overby is a very complete encampment of an oval form supposed to be of Saxon origin, and at Raeburn-foot is a Roman camp which probably communicated with those of Middlebie and Netherby. There are ruins of many old towers, vestiges of forts, and a great number of cairns or burials in different places. The most remarkable towers are at Achincass, Lag, Amisfield, Robgill, and Lochwood. At Dryfesdale is the most entire British fort, and at Burnswark-hill near Ecclefechan are very distinct remains of Roman encampments. There are many moats or artificial mounts on which the people are supposed to have met to

make laws and administer justice. Of these Rockhall moat near Lochmaben is one of the largest and most beautiful. Among the antiquities, the cross of Markland, which is an octagon of solid stone, and a very curious antient obelisk, supposed to be of Anglo-Saxon origin, found in the churchyard of Ruthwell, are deserving of notice. The latter is ornamented with figures in relief descriptive of sacred history, and inscribed partly with Runic and partly with Roman characters. The antient buildings in Nithsdale are the castles of Caerlaverock, Morton, Closeburn, Torthorwold, and Sanquhar. In Annandale are the castles of Comlongan, Hoddam, Lochwood, and Achincass. In Eskdale there are some remains and vestiges of the castles of Langholm and Wauchope. Gilnochie in the parish of Canobie was the residence of Johnny Armstrong, a celebrated and powerful border-chieftain. In this parish there are also some vestiges of a monastery, which was pillaged, and laid in ruins by the English soldiers after the battle of Solway-moss in 1542. Vast quantities of antique pieces of armour, medals, and coins have been found in the county.

The Selgovæ were the most antient inhabitants of this county. In the time of the Romans, Dumfriesshire formed a part of the Roman province of Valentia [BRITANNIA]; and after the Romans had relinquished Britain it constituted a portion of a new kingdom founded by Ida and the Angles. In the eighth century it was under the dominion of the Picts, who dismembered Galloway and Dumfriesshire from the Northumbrian monarchy. Until the reign of James VI. this county was the scene of many battles and of many a feud and foray, which were often occasioned by the jealousies of the rival chieftains. Being seated on the borders it was also liable to the incursions of the English and to frequent predatory warfare. It was likewise the birth-place and residence as well as the scene of the heroic actions of many warriors distinguished in Scottish history. For a long time many of the inhabitants subsisted entirely by spoil and pillage, and the rapine of those freebooters was as intolerable to their own countrymen as to the English. This life of predatory warfare was afterwards exchanged for vicious idleness and lawless independence. The contraband trade with the Isle of Man prevailed to a great extent, and the borders were for a considerable time infested with daring bands of smugglers. In the rebellions of 1715 and 1745, but particularly in the latter, the country districts endured various outrages, and the county town sustained damage to the amount of 4000*l.*, but in 1750 the crown granted a dividend of 2800*l.* on the above sum out of the forfeited estate of Lord Elcho.

(Dr. Singer's *General View of the Agriculture, &c. of the County of Dumfries*; *New Statistical Account of Scotland*; Jameson's *Mineralogical Survey of Dumfriesshire*; Chalmers's *Caledonia*; *Beauties of Scotland*; *Communications from Dumfriesshire*.)

DUMONT, ETIENNE, was born at Geneva in July, 1759. His father died when he was very young, leaving a widow, three daughters, and a son (the subject of the present article), with very small means of support. The mother, however, was a woman of strong mind, and struggled against the difficulties arising from her straightened circumstances, that she might give her son a good education. At college Dumont assisted to support himself by giving private lessons. In his twenty-second year he was ordained minister of the Protestant church in Geneva; and we are told by M. Sismondi that his preaching was greatly admired. He left Geneva in the spring of 1783, owing to the triumph then achieved by the aristocratical party in that state through foreign interference; and he betook himself, a voluntary exile, to St. Petersburg, where he assumed the charge of the French Protestant church. He stayed in that city eighteen months, acquiring fame by his preaching; when he was invited to London by Lord Shelburne, afterwards the Marquis of Lansdowne, to undertake the education of his sons. In Lord Shelburne's house he made the acquaintance of Fox, of Sir Samuel Romilly, of Lord Holland, and most of the other distinguished members of the Whig party; and with Sir Samuel Romilly in particular he formed a strong friendship. In 1788, Dumont and Sir Samuel Romilly visited Paris together, and it was on the occasion of this visit, which lasted only two months, that Dumont first became acquainted with Mirabeau.

In 1789 Dumont made a second visit to Paris, accompanied by M. Duroverai, in order to negotiate with M. Necker,

who was then minister, for the liberty of Geneva and the return of her exiles. He stayed in Paris until the beginning of 1791, and during this second visit the acquaintance previously formed with Mirabeau ripened into intimacy. We learn from Dumont's posthumous work, entitled '*Souvenirs sur Mirabeau*,' (a work which has thrown great light on Mirabeau's character, and which is further interesting as giving Dumont's views concerning the French Revolution,) that Mirabeau frequently during this period availed himself of the assistance of Dumont and Duroverai, especially the former, in the preparation of speeches and reports. These three also set on foot conjointly a paper called the '*Courier de Provence*;' though Mirabeau's share in the composition of it was not very great.

It was not until Dumont's return to England in 1791 that his intimacy and co-operation with Mr. Bentham commenced. [BENTHAM]. Admiring Mr. Bentham's talents, and impressed with the importance of his pursuits, he craved leave to arrange and edit those writings on legislation which their author would not himself publish. The task was one comparatively humble, yet useful. Further, it was a task of some difficulty. 'I have had,' says Dumont himself, in his preface to the '*Traité de Legislation*,' 'to select from among a large number of various readings, to suppress repetitions, to clear up obscurities, and to fill up *lacunæ* which the author had left that he might not slacken in his work. I have had to do much more in the way of curtailment than of addition, of abridgment than of extension. The mass of manuscripts which has passed through my hands, and which I have had to decipher and compare, is considerable. I have had to do much to attain uniformity of style, and in the way of correction; nothing or next to nothing as regards the fundamental ideas. The profuseness of their wealth was such as to need only the care of an economist, and being appointed steward of this large fortune, I have neglected nothing which could improve its value or help to put it into circulation.' (p. 2.)

The following are those of Mr. Bentham's works which were edited by Dumont. 1. The '*Traité de Legislation*,' 3 vols., published in 1802. 2. The '*Théorie des Peines et des Recompenses*,' 2 vols., in 1811. 3. The '*Tactique des Assemblées Législatives*,' in 1815. 4. The '*Preuves Judiciaires*,' 2 vols., in 1823. The '*Organisation Judiciaire et Codification*,' in 1828.

In 1814 Dumont had returned to Geneva, his native state having then recovered her independence. He was elected a member of the representative council of Geneva, and, having been appointed on a committee that was to draw up laws and regulations for the council, he was the author of the plan that was ultimately adopted. He afterwards directed his efforts to a reform of the penal system and the prison system existing at Geneva. Under his auspices, a penitentiary establishment was erected at Geneva in 1824, on the Panopticon plan of Mr. Bentham. Dividing his time between his senatorial duties and the publication of those of Mr. Bentham's works which have been named, he lived a useful and a happy life to the age of sixty. He died suddenly in the autumn of 1825, while travelling in the north of Italy.

There is a brief memoir of Dumont by M. de Sismondi in the *Revue Encyclopédique*, tom. 44, p. 258; and another by M. de Candolle in the *Bibliothèque Universelle* for November 1829. M. Duroverai has also prefixed a short notice of his life to the '*Souvenirs sur Mirabeau*.'

DUMOURIEZ, CHARLES FRANCOIS, was born at Cambrai in 1739. His father was commissary in the army, and was also an author and a poet. Dumouriez entered the army at an early age, and served in Germany during the seven years' war. After the peace of Paris, 1763, he travelled about Europe, offering his services to several states: he visited Corsica, and afterwards Spain and Portugal, and wrote an essay on the military situation and resources of the latter kingdom. Having returned to France, he was appointed quarter-master-general to the French expedition for the conquest of Corsica, 1768-9. He was afterwards sent to Poland on a mission to the confederates of Bar, with whom he made the campaign of 1771 against Russia. He was afterwards sent by Louis XV. on a confidential mission to Sweden, in the same manner as the Chevalier D'Eon, count Broglie, and others, who were sent to England and other countries, and who corresponded directly with the king without the intervention of his ministers. The ministers however became jealous of Dumouriez, and found means to arrest him at Hamburg;

whence he was brought back to Paris under a lettre de cachet, and lodged in the Bastille.

He was released by Louis XVI. on his coming to the throne, and restored to his rank of colonel. In 1778 he was sent to Cherbourg to form there a great naval establishment connected with the proposed invasion of England, and he furnished the ministry with plans for the conquest of the islands of Jersey, Guernsey, and Wight. At the beginning of the revolution he took the popular side, and became connected with the Girondins, by whose interest he was appointed minister of foreign affairs, in which capacity he prevailed upon the king to declare war against Austria in April, 1792. Soon after he left office, upon the dismissal of the other Girondin ministers, Roland, Servan, Claviere, &c. Dumouriez had now become afraid of the violence of the revolutionary movement, the Jacobins hated him, and even the Girondins grew cool towards him. Like La Fayette, he professed his attachment to the constitutional monarchy of 1791, which the others had given up. He withdrew himself however from internal politics and went to serve under General Luckner on the northern frontiers. After the 10th of August he was appointed to replace La Fayette in the command of the army which was opposed to the Duke of Brunswick. The army was disorganised, but Dumouriez soon re-established order and confidence; he obtained a series of partial but brilliant successes, which checked the advance of the Prussians; and, lastly, he made a determined stand in the forest of Argonne, which he styled the Thermopylæ of France, by which means he gave time to Kellerman and other generals to come up with fresh divisions, and give battle to the Prussians at Valmy, 20th September, 1792, an engagement which was won by Kellerman. It is generally allowed that Dumouriez' stand at Argonne was the means of saving France from a successful invasion.

At the end of October Dumouriez began his campaign of Flanders; gained the battle of Jemmapes against the Austrians, 5th and 6th November; took Liege, Antwerp, and a great part of Flanders, but, on account of some disagreement with Pache the minister at war, he was obliged to return to Paris during the trial of Louis XVI. After the execution of the king, Dumouriez returned to his headquarters, determined to support, on the first opportunity, the re-establishment of the constitutional monarchy under the son of Louis. Meantime he pushed on with his army, entered Holland, and took Breda and other places, but being obliged, by the advance of Prince Cobourg, to retire, he experienced a partial defeat at Neerwinde, and again at Louvain. Meantime he had displeased the convention by opposing its oppressive decrees concerning the Belgians, and he wrote a strong letter on the subject to that assembly on the 12th of March, which, however, was not publicly read. Danton, Lacroix, and other commissioners of the convention came successively to his head-quarters to watch and remonstrate with him, but he openly told them that a republic in France was only another name for anarchy, and that the only means of saving the country was to re-establish the constitutional monarchy of 1791. Dumouriez entered into secret negotiations with Prince Cobourg, by which he was allowed to withdraw his army unmolested to the frontiers of France, and also his garrisons and artillery which he had left in Holland, and which were cut off by the advance of the enemy. These favourable conditions were granted by Cobourg on the understanding that Dumouriez should exert himself to re-establish the constitutional monarchy in France. Dumouriez retired quietly to Tournay, and evacuating Belgium withdrew within the French frontiers, where he placed his head-quarters at St. Amand, 30th March, 1793. He was now accused of treason at Paris: the convention passed a decree summoning him to their bar, and four commissioners, with Camus at their head, came to St. Amand to announce to him the summons. Dumouriez replied that he was ready to resign the command, if the troops consented, but he would not go to Paris to be butchered. After a violent altercation he gave the commissioners in charge to some hussars, and sent them over to the Austrian general Clairfait, at Tournay, to be detained as hostages.

His design was now to march upon Paris, but his troops, and especially the volunteers, refusing, he was obliged to take refuge himself, with a few officers, at the Austrian head-quarters, April, 1793. He there found out that his plan of a constitutional monarchy was disavowed by the allies, and in consequence he refused to serve in the Austrian army against his country. He wandered about various

towns of Germany, treated with suspicion, and annoyed by the royalist emigrants, who hated him as a constitutionalist while in France the Convention offered a reward of 300,000 francs for his head. Having crossed over to England, he was obliged to depart under the alien act, and took refuge at Hamburg, where he remained for several years, and wrote his memoirs and several political pamphlets. In 1804 or 1805 he obtained permission to come to England, where he afterwards chiefly resided. He is said to have furnished plans to the British and Portuguese governments for the operations of the peninsular war; and he received a pension from the British government, upon which he lived to a very advanced age. It is remarkable that after the restoration he was not recalled to France by Louis XVIII. In 1821 he wrote a plan of defence for the Neapolitan constitutionalists. He died in March, 1823, at Turville Park, near Henley-upon-Thames, at the age of eighty-four. (*Mémoires du Général Dumouriez*, written by himself; and an article in the Supplement to the 6th volume of the *Bio-graphie des Contemporains*, which seems fairly and soberly written.)

DUN-LE-ROI. [CHER.]

DÜNA, the, or in Livonian the DA-UGAVA, and in Russian the ZAPADULA, a considerable river in Western Russia, rises from several springs not far from the source of the Volga, which flow out of marshy ground in the neighbourhood of the Volkonsky forest, near the south-western confines of the government of Tver. It winds in a west-south-westerly direction, nearly parallel with the Dnieper, until it has passed Vitepsk, having become navigable for flat-bottomed craft at Valisch, or Velige, above Vitepsk. Thence, forming the boundary between the governments of Polotsk and Minsk, as well as those of Livonia and Vilna, it turns to the north-west, and near Dünsburg flows almost due north until it reaches the point where it begins to constitute the frontier between Livonia and Courland; from that point it continues its course west-north-west to Dünamünde, below Riga, where it falls into that arm of the Baltic called the Gulf of Riga, in 57° N. lat. The entire course of the Düna, inclusive of its windings, is about 655 miles; its length in a straight line from the source to the mouth is about 325 miles. Güldenstädt states that the fall of its waters is, in the upper part of its course, one foot in every 2000 fathoms, and in its passage through the lower part, where the land is more level, six inches in every 2000 fathoms, its average fall being six inches in every four versts (about 2½ miles). The navigable portion of the Düna, namely, from Velige to Dünamünde is about 405 miles in length, but the navigation, owing to the variableness of its depth, which ranges from two to four fathoms, to its shallows, and to a stratum of rock, which runs across its bed just above Riga, and the sandbanks at its mouth, is extremely difficult, and even dangerous, for vessels of any size. Its course above Riga, indeed, is not practicable for any but the flat-bottomed craft called Strusen. At Riga its breadth is about 3000 feet. In the spring the surface is covered with rafts, logs, and planks, which are thus floated down from the forests of Livonia, Lithuania, and Semigallia, as well as the more westerly provinces which it passes through. It contains several islands, and abounds in fish. The tributaries of the Düna greatly augment its waters, though they are not of any great length: the chief of these are the Töreptsa, which is navigable from Töropetz to its mouth, a distance of about 60 miles; the Ulla, which flows out of lake Beloye, and is navigable for about 56 miles; the Kasplia, which is navigable from Poritsch, about 110 miles from its mouth; the Ewst, Meshna, and Disna, the last of which rises in the government of Vilna; and the Bolder-Aa, which flows past Mittau, then skirts the southern shore of the gulf of Riga, and ultimately falls into the Düna just above its mouth. The Narofna, which joins the Düna on its right bank, can be regarded only as an outlet for lake Peipus, and is from 37 to 42 miles in length. The basin of the Düna comprehends an area of about 28,350 square miles.

DÜNABURG, the chief town of a circle in the north-western part of the government of Witepsk in Western Russia, and formerly the capital of Polish Livonia. It lies on the right bank of the Düna, and on both sides of the Shunitzee, which flows into it; in 55° 53' N. lat., and 26° 24' E. long. It was founded in 1277 by the Knights of the Sword, and while attached to the Polish crown was the residence of a bishop, voyvode, and castellan. At the pre-

sent day it is become of great military importance, from the strength which has been given to its fortifications. Dünaburg contains a Greek and two Roman Catholic churches, and a synagogue, a suppressed Jesuits' college, and a population of about 4200. It has three fairs in the course of the year, and carries on considerable trade.

DUNBAR. [HADDINGTON.]

DUNBAR, WILLIAM, is supposed to have been a grandson of Sir Patrick Dunbar, of Beil, in the shire of Haddington. This Sir Patrick Dunbar was a younger son of George, tenth earl of March. He was thus also a younger brother of George, eleventh earl, who was attainted in an arbitrary manner, and had his possessions forfeited by King James I. in the parliament held at Perth on the 10th of January, 1434-5; and it appears that Dunbar, being involved in the common ruin of the house, lived in a state of great dependence without any patrimonial inheritance.

The path of ambition in those days, and the road to wealth and honours, was the church, to which Dunbar was destined from his earliest years. In 1475 he was sent to the university of St. Andrews, where he passed bachelor of arts, in St. Salvator's college there, in 1477; and in 1479 master of arts.

He afterwards entered the monastic order of St. Francis; and in the habit of a friar travelled not only throughout the south of Scotland, but also into England and on the continent. From his writings we learn that he was frequently employed abroad in the king's service, but in what capacity does not precisely appear. It was in all likelihood as a *clerk* in some of the numerous missions despatched by King James IV. to foreign courts. Of his own fidelity to his royal master on these occasions he entertained a tolerably high opinion; and few opportunities escaped of his reminding the king of the nature and extent of his services, with not merely distant hints, but direct intimations of the propriety of a recompense. It was no doubt with a view to this, but partly also, and perhaps mainly, to remunerate his higher labours of the intellect and fancy, to reward his literary merit, and to attach him to the person of the king, that, on the 13th of August, 1500, he had a grant from his majesty of an annual provision of 10*l.* during his life, or until he should be promoted to a benefice of the value of 40*l.* or more yearly.

In the year 1501 he was again in England, probably in the train of the ambassadors who were sent thither to conclude the negotiations for the king's marriage. The preparations for this marriage began on the 4th of May, 1503; and upon the 9th of that month Dunbar composed his poem of 'The Thistle and the Rose,' a rich and elegant allegory in celebration of the union. On the 7th of March following he said mass for the first time in the royal presence, and received a liberal gift as the king's offering on the occasion. In the year 1505 he also received a sum from the king in addition to his stated pension; and both that year and the next a sum equal each time to his half-yearly allowance in lieu of his 'vule-gown.' In 1507 his pension was doubled; and besides occasional marks of the royal bounty, he had a letter under the privy seal in August, 1510, increasing the sum to fourscore pounds a year, and until he should be promoted to a benefice of 100*l.* or upwards. This allowance he continued to receive, with other gifts, till the time of the king's death at Flodden in September, 1513, after which we find no farther mention of Dunbar's name in the treasurer's account, or other like records. He is supposed to have died about the year 1520.

Whether he at last obtained the great object of his desires does not appear. His remaining works do not show that he ever did. On the contrary, they contain many supplications for a benefice, and many lamentations for the want of one; and the various forms and character of these pieces display not a little of that fertility of invention by which Dunbar is distinguished. He seizes every occasion and seems to exhaust every expedient to rouse the king to bestow upon him the long-cherished wish of his heart. A singular one is the poetical address to the king by Dunbar in the person of 'an auld grey horse' worn out in the royal service, and to the petition is appended the king's reply, written, as it seems, by Dunbar himself, in the hope, no doubt, that the king would adopt it as his own. In modern orthography the reply runs thus:—

'After our writings, treasurer,
Take in this grey horse, old Dunbar,
Which in my *acht* with service true
To lyart changed is his hue.

Ger house him now against this yule,
And busk him like a bishop's mule;
For with my hand I have indost
To pay whate'er his trappings cost.'

Dunbar's writings now extant are not numerous, but they exhibit an amazing versatility of genius, from grave to gay, from witty to severe. At one time we find him the sober moralist supporting the weak, instructing the ignorant, warning the rash; at another, indulging in all the immodesty of licentiousness. But it is in description that he shows his various powers most conspicuously. Thus, in his 'Golden Terge,' as in 'The Thistle and the Rose,' we have imagery brilliant and dazzling. In the 'Dance of the Deadly Sins in Hell,' the same creative hand appears. 'The Feigned Friar of Tungland' and 'The Justs between the Taylor and the Souter' display the same power of vividly portraying character, mingled with bitter sarcasm and biting satire. And in the doggerel lines 'On James Doig' we see the burly wardrobe-keeper pass before us, and feel

'His gang gars all the chalmers schog.'

The existence of Dunbar's works is a signal proof of the immortality of real merit. We know not at what precise time he was born, nor when he died; his very name, it has been remarked, is, with one solitary exception, not to be met with in the whole compass of our literature for 200 years, and it is only after the lapse of three centuries that his poems have been collected and published; and yet he now once more stands forth as one of the very greatest of Scotland's poets.

DUNBLANE. [PERTHSHIRE.]

DUNCAN, ADAM, was born July 1, 1731, at Dundee, of which his father was provost in 1745. By the mother's side he was descended, through the Haldanes of Gleneagles, from the earls of Lennox and Menteith. He entered the navy in 1746, was made post-captain in 1761, and distinguished himself in several actions, especially at that of Cape St. Vincent. In 1787 he became a rear-admiral, and seven years afterwards was appointed to command in the North Seas. In this service he watched the mouth of the Texel, where a large Dutch fleet lay at the time of the mutiny at the Nore. By skilful manœuvring, although deserted by every ship except one (*Adamant*, 30), he detained them until he was joined by the rest of the fleet, and, on their leaving port, cut off their retreat and brought them to action at Camperdown, where he captured nine sail of the line and two frigates. For this service Admiral Duncan was created a viscount and received the thanks of parliament. He died suddenly, August 4th, 1804. By his lady, the daughter of Lord President Dundas, he left two sons and several daughters. His eldest son was created earl of Camperdown, at the coronation of William IV. His youngest, Sir Henry Duncan, was principal storekeeper to the Board of Ordnance, and died in 1835.

DUNDALK. [LOUTH.]

DUNDEE, a large seaport town and parish of Scotland, on the north shore of the Frith of Tay, in the shire of Forfar. The parish extends 6 miles along the shore, and is from 1 to 4 miles in breadth. The town is in 56° 27' N. lat. and 3° 3' W. long., 42 miles north-north-west from Edinburgh. It stands on a gentle acclivity rising from the water-edge towards a high hill at the back, called the Law.

The antient Gaelic name, still used by the Highlanders, is *Ail-tec* (beautiful). In the Latin annals of Hector Boethius it is *Alectum*. Buchanan names it *Taodunum* (hill of the Tay), and in several antient records it is variously called *Dondé*, *Dondie*, and *Donum Dei*. The place, from a fishing village, became a fortress with walls, gates, and castle, and was the residence of several kings of Scotland. In various civil wars it suffered severely, and was repeatedly plundered and burned: however, it always speedily recovered from these disasters, and has long been noted as a place of commercial opulence and prosperity. When, in 1645, it was sacked and burned, it was one of the richest towns in Scotland; and when, after a siege of six weeks, it was taken by Cromwell's officer, General Monk, sixty vessels in the harbour were laden with the spoil, and each soldier's share was 60*l.* The commerce of Dundee has been remarkable for its successive adoption of different speculations. About forty years ago leather was a principal article, and 7000*l.* worth of shoes were annually exported. This trade is now extinct. At one time seven companies successfully prosecuted the cotton manufacture, which was succeeded by woollens; but the permanently prosperous commerce and trade of this town have been

produced by the importation and manufacture of Russian hemp and flax. Of late years the business in this branch of trade has greatly increased. The fabrics are chiefly of a coarse description, as sacking, sail-cloth, &c., of which large quantities are made for exportation; but finer and bleached linens are also extensively manufactured. Thirty large spinning-mills are driven by steam, and employ a great number of persons, principally children. There is an iron-foundry, machine-factories, several sugar-refineries, candle-manufactories, and much rope-making and ship-building. In 1830, the total tonnage of vessels which entered the harbour amounted to 182,512; and the exports of linen and hempen goods were to the amount of 464,752 tons. In 1832 the tonnage of vessels belonging to the port was 32,868, and the number of seamen employed, 3500. Nine vessels are employed in the whale-fishery of Greenland.

Dundee is the chief seat of the Scotch and indeed of the British linen manufacture. The business commenced about the middle of the last century. In 1745 the importation of flax was only 74 tons. From that period to the present the amount of imports and exports has annually increased in a most astonishing ratio. The increase is mainly attributed to the introduction of spinning machinery, by which the whole price of the thread is now reduced to less than the mere cost of spinning by the old hand-wheel.

In 1831 the number of spinning-mills worked by steam in the town was 31, exclusive of many in the suburbs. The present number exceeds 50. In the last census of the county of Forfar, the number of males of the age of 20 and upwards engaged in the linen manufacture in Dundee is stated to have been 3300. In 1835 there were 25,169 tons of hemp and flax imported, and the number of pieces of sheetings, bagging, sailcloth, sacking, and dowlas exported was 618,707, containing about 70,000,000 yards, and worth about 1,600,000*l.*, being considerably greater than the entire exports from Ireland. To show the amazing progress of the trade of Dundee, it may be mentioned that persons now living once farmed the harbour dues at 400*l.* a-year, which now bring about 10,500*l.* (MacCulloch's *Statistics of the British Empire*, vol. ii. p. 90.) The Frith, opposite the town, is two miles in width, and is crossed every half hour by an enormous double steam-boat of a peculiar and very commodious construction. The dangerous and numerous sand-banks in the estuary are avoided by excellent charts of the soundings, two lighthouses, and several beacons. The present docks and quays have cost 200,000*l.*, and further improvements are suggested. Besides a number of smacks, steamers sail regularly to London, two of which have engines each of 125 horse power.

A railway communicates with Newtyle, in Strathmore, and passes through the Law by a tunnel.

The town consists of a spacious market-place and six principal streets diverging from it. In the older parts the houses are closely packed together, but many, especially in the western extremity, are large airy mansions with ornamental gardens. Numerous improvements are going on in the appearance and conveniences of this highly prosperous place. It is lighted with gas, is well paved, is abundantly supplied with spring-water, and has several well attended markets. The finest public buildings are the Exchange, the Trades' Hall, and the Town House.

Besides a good parochial school, there is a public academy conducted by superior masters, a royal infirmary, a dispensary, lunatic asylum, and several incorporated benevolent institutions. The lofty square Gothic tower of the spacious old church is a conspicuous object at a great distance. There are three other churches, or chapels of ease, a Gaelic church, and several dissenting chapels.

Dundee has produced many eminent ministers. At the Reformation it was distinguished for its Protestant enthusiasm; though before that event, when the population was comparatively very small, there were ten Catholic churches, four monasteries of friars, gray, black, and red, and a nunnery. Among the distinguished persons born and educated here may be named, Hector Boethius, Fletcher of Saltoun, Dempster, Admiral Duncan, Sir William Wallace, the Earl of Mar, and the poet Ferguson.

Dundee was made a royal burgh by William I., in 1165. It returns one member to parliament. Population in 1831, 45,355; at present it is probably 50,000.

DUNFERMLINE (pronounced Dumferline, and signifying fort of the crooked river), a town and parish of Scot-

land, in the shire of Fife, 15 miles north-west of Edinburgh, and 2½ miles north of the Frith of Forth. It is 3 miles from the sea, and 270 feet above its level, commanding magnificent and extensive views of the windings of the Forth and of the principal hills of the south of Scotland. It is a place of great antiquity. King Malcolm Canmore founded here a very spacious and superb Benedictine monastery, of which the extant ruins, with those of his palace and castle, are objects of much interest to the antiquarian. After the celebrated Iona, or Icolmkill, the abbey church of Dunfermline was the common cemetery of the kings of Scotland. In 1818 the skeleton of King Robert Bruce, measuring above six feet in length, was disinterred, and a cast was taken of the cranium. This Abbey was the most eminent in Scotland, and was very richly endowed, and possessed of peculiar privileges. The Fraternity with its fine Gothic window still indicates the grandeur of the original buildings. (Grose's *'Antiquities of Scotland,'* fol., vol. ii.) The Guildhall is a fine building with a lofty spire.

The town was made a royal burgh by James VI. An extensive business is carried on in the manufacture of diaper and fine table-linen; the value of the quantity annually manufactured is about 200,000*l.* The parish contains a large coal-field and collieries, the property of the Earl of Elgin, and in the town are several breweries, an iron-foundry, and candle and tobacco manufactories.

Dunfermline is the principal seat of the manufacture of the finer sorts of linen fabrics, as shirting, damasks, and table-linen. The thread is spun by machinery. Of late years the beauty of the patterns and the fineness of the goods have been much improved, and the manufacture has greatly increased. In the census of 1831 it is stated that 2700 males of the age of 20 and upwards were then employed in the linen manufacture in this town.

The situation is picturesque, and the houses are intermingled with luxuriant trees, over which the spire of the Abbey church rises to the height of 155 feet. The western suburb is composed of superior houses. An enormous meeting-house, built for the celebrated minister, Ralph Erskine, is a conspicuous object in approaching the town. There are several beneficent institutions and schools, and two public subscription libraries. The streets are paved and lighted with gas. Population in 1831, 27,692

DUNG. [MANURE.]

DUNGANNON. [TYRONE.]

DUNGARVAN. [WATERFORD.]

DUNKELD. [PERTSHIRE.]

DUNKERQUE, or as it is not unfrequently written by the English, **DUNKIRK**, a town in France, capital of an arrondissement in the department of Nord. It is on the sea, about 150 miles in a straight line north of Paris, or 165 miles by the road through Clermont, Amiens, Doullens, St. Pol, Aire, Hazebrouck, Cassel, and Bergues: in 51° 3' N. lat. and 2° 22' E. long.

This place is said to owe its origin to a chapel founded by St. Eloi, which, from its situation among the sandy downs of the coast, took the name of Dun-kirk, i. e. the church of the downs. In the 10th century, by the favour of Baudouin or Baldwin III., called Le Jeune, Count of Flanders, it was raised from a mere village to the rank of a town. In the records of the 12th century it is mentioned by the names Dunkerea, Dunekerca, and Dunikerca. In the 14th century a castle was built here by Robert count of Flanders, but it was demolished in a revolt of the Flemings, or perhaps by their supporters the English, who burnt the town in 1388. Another castle, built in 1538, to defend the port, by Charles V., to whom it had come with the rest of Flanders by inheritance, has also been demolished. In 1658 the English, who had rendered themselves masters of the town, were driven from it by the French under the Marshal de Thermes but in the following year it was given up to the Spaniards by the treaty of Le Château-Cambresis. In 1646 it was taken after a short siege by the French under the duke of Enghien (better known by his subsequent designation of the Great Condé), in spite of the vigorous defence of the Marquis de Leeds, the Spanish governor; but it fell again shortly after into the hands of the Spaniards. In 1658 Turenne, having defeated the Spaniards at the battle of the Downs (bataille des Dunes), took Dunkerque, which, according to a treaty previously concluded with Cromwell, was put into the hands of the English: four years afterwards (in 1668) Charles II. restored it to France on condition of receiving for it a considerable sum of money. Louis XIV.,

then king of France, made extraordinary exertions to fortify it, and to repair the harbour; in 1671 thirty thousand men were employed on the works, and its strength enabled the town to repel an attempt made by the English to bombard it 1695. By virtue of the peace of Utrecht, the fortifications were rased and the port filled up. The maritime activity of the people of Dunkerque, and the number of privateers and ships of war which they sent out were probably the inducement to the English and Dutch to require these hard conditions. By the peace of Aix-la-Chapelle the port and fortifications, which had been partially restored in the previous war, were again demolished; but by the peace of 1783 they were allowed to be restored. In 1793 the town was besieged by the allies under the Duke of York; but the victory obtained by the French under General Houchard at Hondscotte obliged the duke to raise the siege and retire, with the loss of 52 pieces of cannon and a large quantity of ammunition.

Dunkerque is separated from the sea by a range of downs: on the land side the town is surrounded by canals. The canal of Bourbourg runs westward to the river Aa: the canal of Furnes runs eastward to Furnes, and so to Nieuport and Bruges, uniting with several of the canals which intersect Belgium. The town of Dunkerque is nearly three miles in circuit. The streets are generally broad, and the houses well built of brick, and whitened or coloured. The place du Champ de Mars is a large and fine square: the place Dauphine is an oblong square planted with trees and adorned with a bust of Jean Bart. [BART.] The fortifications consist of the ramparts, surrounded by ditches, of Fort Louis, and the Citadel.

The principal building is the church of St. Eloi, which has been ornamented by a fine portico of ten Corinthian columns. The great tower which belonged to the church has been separated from it by continuing the line of the Rue de l'Eglise through the church, which is consequently much smaller than it once was: the new front is formed by the portico just mentioned. The hôtel de ville (town-hall) is an insignificant building. There is a range of barracks and naval storehouses.

The population of Dunkerque in 1832 was 24,937. The inhabitants are engaged in the manufacture of soap, starch, beet-root sugar, cordage, and leather: there are metal foundries, gin distilleries, and salt-works. Snuff was formerly manufactured to a great extent. There are two fairs in the year for linens, woollen cloth, jewellery, hardware, and pottery. The trade by sea is very considerable, especially since it was declared in 1816 a free port. The harbour is large and convenient; but there is a dangerous bar at its mouth. The Newfoundland and Iceland cod fishery, and the herring fishery, are prosecuted with considerable spirit; and the town has a considerable trade in Bordeaux wines and brandies.

Dunkerque has a *tribunal de première instance*, or subordinate law court, and a *tribunal de commerce* for the decision of commercial disputes. There are a high school, schools of navigation, drawing, and architecture, an agricultural society, a learned society under the designation of 'conseil polytechnique,' and a public library of 4000 volumes. There are also a theatre, an hospital, a foundling hospital, and two prisons, one of them military.

The language commonly spoken by the poorer inhabitants is Flemish, but most of them are also acquainted with French, which is the ordinary language of the place.

The arrondissement of Dunkerque is divided into seven cantons, and comprehends sixty communes. It had in 1832 a population of 95,571.

DUNMOW BACON. A custom prevailed at Dunmow, in Essex, and was observed there even as late as the middle of the last century, of giving a fitch of bacon to any married man or woman who would swear that neither of them, in a year and a day, either sleeping or waking, repented of their marriage. Brand, in his 'Popular Antiquities,' vol. ii. pp. 98, 99, has given the rhyming oath which was administered to them upon the occasion. The parties were to take it before the prior and convent of Dunmow and the whole town, kneeling in the churchyard upon two hard pointed stones. They were afterwards carried in procession through the town upon men's shoulders, with the bacon borne before them. The register of Dunmow priory attributes the institution of this ceremony to Robert Fitzwalter, a descendant from Juga, the foundress of the priory, some time in the reign of Henry III., and preserves memoranda of three claims made for the bacon prior to the dissolution of reli-

gious houses; namely, in the 7th Edw. IV., in the 23rd Hen. VI., and in 1510, 2nd Hen. VIII. This ceremony is alluded to in the 'Visions of Piers Plowman,' and also by Chaucer in the 'Wife of Bath's Prologue.' (See Brand, ut supr.; Morant's *Hist. of Essex*, vol. ii. p. 429; Blount's *Jocular Tenures*, 8vo., York, 1784, p. 276; Dugdale's *Monasticon*, last edit., vol. vi. p. 149.) The Dunmow Bacon was claimed in 1701, and again in 1751, when a large print was engraved of the ceremonial which took place on the occasion.

DUNN, SAMUEL, was a native of Crediton, Devonshire, where he kept a mathematical school for several years; but he afterwards removed to Chelsea, and occupied himself in the same manner. He was well skilled in nautical astronomy, and was a good practical observer, which led to his being appointed mathematical examiner of the candidates for the East India Company's service.

He was the author of several useful and ingenious papers in the 'Philosophical Transactions,' as well as of some separate works on the practical branches of science. He also published a folio Atlas, which has been held in some estimation.

Mr. Dunn bequeathed an estate of about 30*l.* a year to found a mathematical school in his native town, the first master to which was appointed in 1793.

DUNNING, JOHN, Lord Ashburton, the son of an attorney at Ashburton in Devonshire, was born 18th October, 1731. He was removed from the free-school at Ashburton, and articled to his father as a clerk in the thirteenth year of his age. Sir Thomas Clarke, the then master of the rolls, who employed old Mr. Dunning as his attorney, having observed the young man's capabilities for active business, induced him to study for the bar. He entered of the Middle Temple, May 8th, 1752, and was called to the bar, according to the Temple books, July 2, 1756.

Dunning travelled the western circuit for some years without any success; but in 1761, through the good offices of Mr. Hussey, a king's counsel, being appointed to draw up the reply of the East India Company to the Dutch memorial, he acquired some connexions, which were considerably increased by his argument in the case of *Combe v. Pitt* (Trin. Term, 1763), which he was called upon to make in consequence of the illness of his leader. In the course of the same year the question as to the legality of general warrants arose, in consequence of the arrest of the publishers of the *North Briton*. Dunning throughout the whole litigation was employed as the advocate of his friend Wilkes; and the argument on the Bill of Exceptions (June, 1765) afforded him an opportunity of establishing his reputation. After this his business rapidly increased: he was shortly chosen recorder of Bristol, and in December, 1767, appointed solicitor-general.

In the following year he entered parliament as one of the nominees of Lord Shelburne for the borough of Calne. A Whig in his politics, and an accomplished constitutional lawyer, Dunning throughout his parliamentary career unflinchingly opposed the Tories. He laboured strenuously to reduce the pension list, but unfortunately for his own fame, himself became a pensioner to the amount of 4000*l.* a year, when, in the spring of 1782, he was raised to the peerage by the title of Baron Ashburton, of Ashburton in the county of Devon. Possessing the most lucrative practice of the day, which had already enabled him to purchase considerable landed property, and to save a sum little short of 180,000*l.*, and having besides within a week after this promotion possessed himself of a lucrative sinecure, the chancellorship of the duchy of Lancaster, Dunning had not even the poor excuse of poverty for this political profligacy. This venality and want of principle, which so often unfortunately obscure the fair fame of individuals, are not wholly without profit to the public; they afford an example which acts as a warning to them against placing implicit confidence in the unbounded professions of ambitious and unprincipled men; for however popular, however distinguished may be the name of such a man in his own day, a few short years are sure to consign him to well merited neglect, if not contempt. Such, as a politician, has been the lot of Dunning. As a lawyer none of his contemporaries enjoyed a higher reputation, or more lucrative practice: his wit appears to have been of that brilliant nature which defies description. In person Dunning was small, and singularly weak and awkward; his action in speaking clumsy and uncouth, but the awkward-

ness of his gesticulation was soon lost sight of in the interest aroused by his eloquence. Notwithstanding his disadvantages, he was himself extremely vain of his personal appearance, and wished to encourage the belief that his face and figure had irresistible charms in the eyes of the fair sex.

Dunning married in 1780 Miss Elizabeth Baring, the daughter of a retail tradesman at Exeter, by whom he had two sons. The death of the eldest in April, 1783, is supposed to have given so great a shock to the already enervated frame of Lord Ashburton as to have hastened his death, which took place at Exmouth in the August following. When on his journey to Exmouth he is said to have met Wallace, the attorney-general, at Bagshot, who was proceeding to London for medical advice, where he died in the following November. These equally celebrated lawyers, who had been competitors in Westminster Hall, and opponents in parliament, having expressed a strong wish to have a last interview, passed some time in conversation, resting on two sofas, and parted to meet no more.

The title of Baron Ashburton having become extinct, was revived in the year 1834, in the person of the present lord (formerly Mr. Baring), who is a descendant of the Miss Elizabeth Baring mentioned above.

There are notices of Dunning in the 7th vol. of the *Law Mag.*; and in Roscoe's *Lives of Eminent Lawyers*, from which this account is taken.

DUNOIS, a district of Orléanois, in the old territorial division of France. It was bounded on the north by Perche and Chartrain, on the east by Orléanois Proper, on the south by Blaisois, and on the west by Vendômois. Its capital was Châteaudun, which had in 1832 a population of 6461. It is now comprehended in the departments of Eure et Loir, Loir et Cher, and Loiret. In the middle ages this district was a county united with that of Blois, without giving to its owner any separate title; but about the commencement of the fourteenth century Hugues, count of Blois, added to his title that of count of Dunois. Guy, count of Blois and Dunois, sold his counties to Louis, duke of Orléans (brother of Charles VI. of France), whose son Charles bestowed the county of Dunois upon his natural brother Jean, who took so eminent a part in the expulsion of the English from France, under the designation of the Bastard of Orléans, and through whom alone any historical interest attaches to the district.

DUNS SCOTUS, JOHN, was born most probably about the year 1265. The English, the Scotch, and the Irish, have all claimed him as a countryman. According to one of the Irish accounts, he was born at Thathmon or Taghmon in Wexford; according to another, in the town of Down or Downpatrick. The Scotch say he was a native of Dunse in Berwickshire, and in that village they still pretend to show the house where he was born. The English story is, that he was born at a hamlet called Dunston or Dunsance, in the parish of Emildon or Embleton, not far from Alnwick in Northumberland. Camden (*Britannia*, 1096, Gibson's translation, 2nd edit.) affirms this on the authority of an inscription at the end of a manuscript copy of the works of Duns in the library of Merton College, Oxford. But Lord Hailes remarks (*Annals of Scotland*, ii. 324, edit. of 1819), 'This testimony is not sufficient to confute the received opinion; for, in its utmost latitude, it only implies, that an unknown and illiterate transcriber of the works of John Duns chose to make him a native of a place in Emildon in Northumberland called Dunstan, and by a fanciful abbreviation Duns.' In an English translation of one of his treatises ('Idiota's, or Duns' Contemplations of Divine Love,' 12mo., Paris, 1662), the translator, W. B., in a dedication 'to the Right Worshipful Edmund Duns, Esq.,' whom he affirms to be a descendant of the same family that produced Scotus, contends that Duns Scot is merely Dunscoot, formed from cot, a cottage, in the same manner with Westcot, Southcot, &c. Mackenzie (*Lives of Scottish Writers*, i. 215) says that he was descended from the family of the Dunses in the Merse. Camden conceives he was called Scotus because descended from Scottish parents. Those who have written of Duns have delighted in allusions to this controversy about the place of his nativity. One of his biographers (Wadding) conceives that it places him above Homer, for the honour of having given birth to whom only cities contended, whereas kingdoms put in their several claims to Scotus. He observes also that the subtlety of the great Doctor may be said to have com-

menced even before his birth, since no one has yet been able to track him to his first appearance in our world.

It seems, however, to be agreed on all hands that he was chiefly educated in England. He is said to have been found when a boy tending his father's cows by two Francis cans who were greatly struck with his intelligence; and by the monks of this order he was first instructed in the elements of learning, and then sent to Merton College, Oxford, of which in due course he became a fellow. Passing over various stories that are told of him of a legendary cast, we may enumerate in a few lines the authentic events of his life. While yet a student, he is said to have become greatly distinguished for his proficiency in theology, in logic and metaphysics, in civil and canon-law, in mathematics, in natural philosophy, and in astronomy. In 1301, on the removal of William Varron to Paris, he was appointed to the theological chair. His prelections were attended by crowds of auditors, the number of students at Oxford at this time, it is affirmed, exceeding 30,000; 'but among these,' says Anthony Wood, 'a company of varlets, who pretended to be scholars, shuffled themselves in, and did act much villainy in the university by thieving, whoring, quarrelling, &c. They lived under no discipline, neither had any tutors; but only for fashion sake would sometimes thrust themselves into the schools at ordinary lectures; and when they went to perform any mischief, then would they be accounted scholars, that so they might free themselves from the jurisdiction of the burghers.' In 1307 Duns removed from Oxford to Paris, in which city he had on a visit some time before distinguished himself in an extraordinary manner by his defence, in a public disputation, of the doctrine of the immaculate conception of the Virgin Mary. He began, we are told, by demolishing two hundred objections to the doctrine, and concluded by establishing it with a cloud of arguments. A writer who was present, Pelbartus à Temeswar, says that he resolved the knottiest syllogisms of his adversaries as Samson did the bands of Dalilah. The result was the conversion of the whole university to the doctrine thus demonstrated, and the passing of a regulation that no person should afterwards be admitted to a degree without swearing to defend the immaculate conception. On this occasion, it is said, there was formally conferred on Scotus the title of the Subtle Doctor (Doctor vel Magister Subtilis), by which he is commonly distinguished among the schoolmen. He taught in his new chair with as much applause as at Oxford; but he was not allowed to remain long at Paris. In 1308 he was ordered by the general of his order to remove to Cologne to found a new university there. On reaching Cologne he was met by nearly the whole body of the citizens, and drawn into the city in a triumphal car. But his splendid career was now near its close. On the 8th of November, in this same year, he was carried off by a fit of apoplexy. Some accounts make him to have died in his 43rd, others in his 34th year. Paulus Jovius relates that he was buried before he was dead, and that it was afterwards found, upon inspection of the grave, that in his misery he had knocked out his brains against his coffin. Another version of the story is, that he was found to have gnawed the flesh from his arms. This termination of his life has furnished a point for several epigrammatic epitaphs. One by Jacobus Latomus has been thus translated by Dr. Kennet, in Gibson's Camden:

'What sacred writings or profane can show,
All truths were, Scotus, call'd in doubt by you.
Your fate was doubtful too: Death boasts to be
The first that choused you with a fallacy;
Who, lest your subtle arts your life should save,
Before he struck, secured you in the grave.'

Various separate treatises of Duns Scotus were sent to the press soon after the invention of printing, and several of them have been repeatedly printed. At length, in 1639, his collected works appeared at Lyon, in 12 volumes folio, under the title of 'R. P. F. Joannis Duns Scoti, Doctoris Subtilis, Ordinis Minorum, Opera omnia quæ hucusque reperiri potuerunt, collecta, recognita, notis, scholiis, et commentariis illustrata; à PP. Hibernis Collegii Romani S. Isidori Professoribus, Jussu et Auspiciis Rmi. T. F. Joannis Baptistæ à Campana, Ministri Generalis.' A complete copy of this collection is exceedingly rare. It is dedicated to Philip IV. of Spain, and the editor is Luke Wadding, an Irishman by birth. It does not however, as has been often stated, contain all the works of Scotus, but only those designated his 'Opera Speculativa,' the 'Positiva,' if they should be completely recovered, having been

intended to form a future publication. The principal pieces of which it is composed are Questions or Commentaries on the Sentences of Peter Lombard, and on the physical, logical, and metaphysical writings of Aristotle. There are also a treatise on Grammar; four books (forming a volume) entitled 'Reportorium Parisiensium'; and a volume of 'Questiones Quodlibetales,' the authenticity of which, however, is doubted by Wadding. The following are enumerated by Wadding as the 'Opera Positiva' of Scotus: 'Tractatus de Perfectione Statuum' (of doubtful authenticity); 'Lectura in Genesim'; 'Commentarii in Evangelia'; 'Commentarii in Epistolas Pauli'; 'Sermones de Tempore'; and 'Sermones de Sanctis.' We are not aware that any of these treatises have ever been printed.

The admirers of Scotus extol his acuteness and subtlety as unrivalled, and he has always been accounted the chief glory of the Franciscans, as Thomas Aquinas has been of their rivals the Dominicans. If in his short life he actually wrote all the works that are commonly attributed to him, his industry at least must have been prodigious. His fame during his lifetime, and long after his death, was not exceeded by that of any other of the scholastic doctors. From him and Aquinas two opposing sects in theology took the names of Scotists and Thomists, and divided the schools down almost to the last age. The leading tenet of the Scotists was the immaculate conception of the Virgin; and they also differed from the Thomists on the subjects of free will and the efficacy of divine grace. In philosophy the Scotists are opposed to the Occamists, or followers of William Occam, who was himself a pupil of Scotus, but differed from his master on the subject of Universals or general terms, which the Scotists maintained to be expressive of real existences, while the Occamists held them to be nothing more than names. Hence the Scotists are called Realists, the Occamists Nominalists. It is a favourite opinion of Bayle's, that this doctrine of the Scotists was nothing less than an undeveloped Spinozism. (*Dict. Crit.*, art. 'Abelard,' note C, and 'André Cispalin,' note B.) It may be added that the English term *dunce* has been commonly considered to be derived from the name of the subtle doctor;—'perhaps,' says Johnson, 'a word of reproach first used by the Thomists, from *Duns* Scotus, their antagonist.' It is worth noting however that a dolt or blockhead appears to be a very modern meaning of the word Duns or Duns. It does not seem to have been known in this sense, for instance, to Richard Stanishurst, the compiler of the Description of Ireland in Holinshed, who speaks of the name of Scotus being a term 'so trivial and common in all schools, that whose surpaseth others either in cavilling sophistry or subtle philosophy is forthwith nicknamed a Duns.' This was no doubt the kind of reproach originally intended to be conveyed by the epithet.

Wadding has prefixed to his edition of the works of Scotus an elaborate Life of the author, which was reprinted at Mons in 12mo. in 1644. There is also a 'Tractatus de Joannis Scoti Vita, &c. Auctore R. F. Joanne Colgano, ordinis Fratrum Minorum Hibernorum Padua,' 12mo. Antwerp, 1655. Both these works, the latter especially, are full of legendary matter, detailed with the most confiding gravity.

DUNSTABLE, or **DUNSTAPLE**, a market town in the hundred of Manshead in the county of Bedford, eighteen miles south-by-west from Bedford, and thirty-three miles north-west-by-north from London, situated at the point of contact of the Iknield and Watling Streets. It was in very early times a place of considerable importance. Its modern name is supposed by many etymologists to be derived from Dun or Dunning, a famous robber in the time of Henry I., who with his band became so formidable in the neighbourhood that Henry cut down a large forest in order to destroy their haunts, and built a royal mansion called Kingsbury on part of its site. He also founded a priory of black canons, on whom he bestowed the town of Dunstable and all its privileges in 1131. The priors had a gaol, possessed power of life and death, and sat as judges with the king's justices in Eyre. In 1290 the corpse of Queen Eleanor rested at the market-place, and a handsome cross was erected to commemorate the event; but it was pulled down in the reign of Charles I. as a relic of popery.

Dunstable is situated at the southern extremity of the county, in the centre of the Dunstable chalk downs. It is chiefly celebrated for the manufacture of straw hats, called 'Dunstable hats,' and for its whitening manufactory. The

market is on Wednesday, and fairs are held on Ash Wednesday, May 22nd, August 12th, and November 12th. The king is lord of the manor, and the duke of Bedford, as his lessee, holds courts leet and baron. The living is a rectory in the archdeaconry of Bedford and diocese of Lincoln. The parish church is now all that remains of the ancient priory; the inside is chiefly Norman, and richly ornamented: over the altar is a large painting of the Lord's Supper, by Sir James Thornhill. There are two places of worship for Baptists, and one for Wesleyan Methodists.

A charity school was founded by Mr. William Chew in 1727, and has since been endowed by various benefactors; forty boys and fifteen girls are clothed, educated, and apprenticed: the boys are admitted at seven, and apprenticed at fourteen. Six almshouses were founded by Mrs. Cart for the residence of six poor widows; and six others were subsequently founded and endowed by Mrs. Ashton for a similar purpose. Near the church are six houses called the 'Maidens' Lodge,' founded in 1713 by Mrs. Blandina Marsh for six unmarried gentlewomen; their income now amounts to 120*l.* per annum. A number of coins of Antoninus and Constantine, as well as other Roman antiquities, have been dug up in the downs in the vicinity of Dunstable.

DUNSTAN, SAINT, was born of noble parents at or near Glastonbury in Somersetshire, in the first year of the reign of Athelstan, A.D. 925. His father's name was Heorstan, his mother's Cynedryda. His earliest instruction in the learning of his time was received in the neighbouring monastery; but afterwards, under the patronage of his uncle, Aldhelm, archbishop of Canterbury, he was introduced at Athelstan's court, where he passed some years. Upon some disgust, he returned to Glastonbury, and having in early youth received the tonsure there, he built for himself a sort of cell or hermitage, with an oratory, employing his time partly in devotional austerities, and partly in the exercise of such manual arts as were useful to the service of the church, in the formation of crosses, vials, censers, vestments, &c. He is also reputed to have painted, and to have copied manuscripts.

Glastonbury having by the successive incursions of the Danes been reduced nearly to ruin, Edmund, the successor of Athelstan, appointed Dunstan to be the abbot of that house, with full power to draw funds from the royal treasury for its restoration. This was in 942, and from a charter granted in 944 the work appears to have been soon accomplished.

In his retreat at Glastonbury, Chalmers supposes that Dunstan's mind was somewhat deranged, and that he indulged chimeras, which being believed by himself and announced to the credulous multitude, established a universal character of sanctity for him among the people. He is said to have fancied that the devil, among frequent visits which he paid him, was one day more earnest than usual in his temptations; till Dunstan, provoked by his importunity, seized him by the nose with a pair of red-hot pincers, as he put his head into the cell, and held him there till the malignant spirit made the whole neighbourhood resound with his bellowings. The people credited and extolled this great exploit, which gained Dunstan so great a degree of reputation that he was called again into the world. Edred, the successor of Edmund, in 948, surrendered his conscience, his treasures, and his authority into the hands of Dunstan. Taking advantage of the implicit confidence reposed in him by the king, Dunstan imported into England a new order of monks, the Benedictines, who, by changing the state of ecclesiastical affairs, excited, on their first establishment, the most violent commotions. Finding also that his advancement had been owing to the opinion of his austerity, he professed himself a partisan of the rigid monastic rules; and he introduced that reformation into the monasteries of Glastonbury and Abingdon. This conduct, however, incurred the resentment of the secular clergy, who, joining with such of the courtiers as had become indignant at the haughty demeanor of Dunstan, formed a powerful party against him. Upon the death of Edred, and succession of Edwy, Dunstan was accused of malversation in his office, was deprived of his abbacy, and banished the kingdom in 955. Edgar, however, who succeeded in the following year, restored him to Glastonbury, having promoted him first to the see of Worcester; he then made him bishop of London; and in 959 advanced him to the archiepiscopal see of Canterbury. Dunstan repaired to Rome to receive the papal

sanction to his appointment, and not only obtained that, but the pope's own appointment of him to be the papal legate in England. Upon his return, so absolute did his influence over the king become that he was enabled to give the Romish see an authority and jurisdiction of which the English clergy had been before, in a considerable degree, independent. In order more effectually and completely to accomplish this object, the secular clergy were excluded from their livings and disgraced; and the monks were appointed to supply their places. The scandalous lives of the secular clergy furnished one plea for this measure, and it was not altogether groundless; but the principal motive was that of rendering the papal power absolute in the English church; for at this period the English clergy had not yielded implicit submission to the pretended successors of St. Peter, as they refused to comply with the decrees of the popes which enjoined celibacy on them. Dunstan, supported by Edgar's authority, overpowered the resistance which the country had long maintained against papal dominion, and gave to the monks an influence, the baneful effects of which were experienced in England till the Reformation. Dunstan has accordingly been highly extolled by the monks and partisans of the Romish church. During the whole reign of Edgar, Dunstan maintained his interest at court; and upon Edgar's death in 975 his influence served to raise Edward, Edgar's eldest son, to the throne, though the succession of Ethelred, the younger son, was much pressed by Elfrida. Whilst Edward was in his minority Dunstan ruled with absolute sway both in church and state; but upon the murder of that prince in 979, and the accession of Ethelred, his credit and influence declined; and the contempt with which his threatenings of divine vengeance were regarded by the king is said to have mortified him to such a degree, that, on his return to his archbishopric, he died of grief and vexation, May 19th, 988. A volume of St. Dunstan's works was published at Douay in 1626. His ambition has given him a considerable place in ecclesiastical and civil history; and he appears to have been a man of extraordinary talents. (William of Malmesbury's *History*; Henry's *Hist. of Britain*, edit. 8vo., vols. iii. and iv.; the *Lives of St. Dunstan in the Acta Sanctorum* of the Bollandists, month of May, tom. iv., p. 344 to 384; and Chalmers's *Biogr. Diet.*, vol. xii., p. 487-490.) Dunstan's Concord of Monastic Rules is printed at large in Reyner's *Apostolatus Benedictinorum in Anglia*, fol. Duac. 1626, at the beginning of the third part of the Appendix, p. 77.

DUNWICH. [SUFFOLK.]

DUODECIMALS, a term applied to an arithmetical method of ascertaining the number of square feet and square inches in a rectangular space whose sides are given in feet and inches. For instance, to find the content of 6 feet 7 inches by 2 feet 5 inches, proceed as follows:—

| Feet. | Inches. | |
|-------|---------|----|
| 6 | 7 | |
| 2 | 5 | |
| <hr/> | | |
| 13 | 2 | |
| 2 | 8 | 11 |
| <hr/> | | |
| 18 | 10 | 11 |

In the answer, 15 means 15 square feet; 10 means 10 strips of one foot by one inch, or 10-twelfths of a square foot; 11 means 11 square inches, or 11-144ths of a square foot. This result is obtained as follows:—

2 feet by 6 feet gives 12 square feet.
2 feet by 7 inches gives 1 foot, 2-twelfths,
or 14-12ths of a square foot.

13 square feet, 2-twelfths.
6 feet by 5 inches gives 2 square feet, 6-twelfths,
or 30-12ths of a square foot.
7 inches by 5 inches gives 2-12ths, 11 sq. in.
or 35 square inches.

2 sq. ft. 8-12ths, 11 sq. in.

The following instances are perfectly similar:—

| Feet | Inches. | Feet. | Inches. |
|-------|---------|-------|---------|
| 11 | 10 | 3 | 4 |
| 12 | 7 | 8 | 6 |
| <hr/> | | | |
| 142 | 0 | 26 | 8 |
| 6 | 10 | 1 | 8 |
| <hr/> | | | |
| 148 | 10 | 28 | 4 |

DUODENUM (from a Latin word signifying twelve, because it is twelve inches in length), the first of the small intestines in immediate connexion with the stomach. It commences at the pyloric end of the stomach, and terminates at the distance of twelve inches in the second portion of the small intestines called the jejunum. Though it is the straightest of the small intestines, yet the duodenum describes in its course various turns. From the pylorus it turns backwards and upwards by the neck of the gall-bladder, with which it is in contact; it then passes obliquely downwards on the right side, immediately before the great vessels which enter the liver. Opposite to the under part of the kidney it makes a turn to the left side, across the lumbar vertebrae, and is lodged in the common root of the mesocolon and mesentery, below the pancreas, and behind the superior mesenteric vessels; it now makes a turn forwards and obtains the name of jejunum.

The duodenum is much more capacious than the jejunum or ilium, and is indeed so large that it has been regarded as a second stomach; and obtained the name of ventriculus succenturiatus. It is fixed much more closely to the spinal column than the other intestines, and does not, like them, float loosely in the abdomen. It is of a redder colour than the rest, has a thicker muscular coat, and a greater number of valvulae conniventes.

At the distance of from three to four fingers breadth from the pylorus, the duodenum is perforated by the biliary and pancreatic ducts, by which tubes the bile and the pancreatic juice flow into the intestine.

The duodenum is probably an organ accessory to the stomach. There is evidence that it carries on the digestion commenced in the stomach. It is certain that alimentary substances which have escaped solution in the stomach are dissolved in the duodenum.

The chyme formed from the food in the stomach and received by the duodenum, retains the name of chyme until it reaches that portion of the duodenum where the biliary and pancreatic ducts pierce the intestine. At this point, and by the admixture of the biliary and pancreatic juices, the chyme is changed into two portions, into a nutritive portion, which receives the name of chyle, and which flows into the blood [CHYLE], and into an excrementitious portion, which is carried along the small into the large intestines, where it receives the name of faeces, and is expelled from the body.

On the surface of the duodenum the lacteal vessels begin to make their appearance for the absorption of the chyle. [LACTEALS.] The duodenum is likewise provided with a great number of mucous glands, which more especially abound near the pylorus. (*Philosophy of Health*.)

DUPLEX QUERE'LA (double querelle or complaint), a process in ecclesiastical causes, in the nature of an appeal from the ordinary to his next immediate superior, as from a bishop to an archbishop, or from the archbishop to the king in council. [DELEGATES, COURT OF.] It seems to have been called double querelle because in its form it is a complaint both against the judge and against the party at whose suit justice is delayed. (Burn, *Eccles. Lar.*)

DUPLICATE RATIO (λόγος διπλασίων), a term used by Euclid, and defined as follows: If A be to B in the same proportion as B to C, then the ratio of A to C is called the duplicate ratio of A to B. When A, B, and C are lines the duplicate ratio of A to B is that of the square on A to the square on B: when numbers, that of A times A to B times B. [RATIO, EXPONENT.]

DUPPLICATION OF THE CUBE, the solution of the following problem: to find the side of a cube which shall be double that of another cube. This question, which is insoluble with perfect exactness by the methods of ordinary geometry, attained such a degree of notoriety among the Greek geometers that its origin was the subject of a mythologic fable. Eutocius, in his commentary on the sphere and cylinder of Archimedes, has preserved a letter of Eratosthenes to Ptolemy (Euergetes) in which it is said that one of the tragedians (Euripides, according to Valckenaer, cited by Montucla's editor) had introduced Minos erecting a sepulchre to Glaucus. The architect proposed one hundred palms every way, on which Minos declared that such a size would be too small for a royal sepulchre, and required that it should be doubled in size; and thereupon arose the difficulty. Eratosthenes also states another fable, namely, that the Delians, during a pestilence, had been ordered by the oracle to produce a cubical altar double of one which

then existed. They applied to the school of Plato at Athens, who found that the problem eluded all their efforts. Other writers make mention of the latter story, and Valerius Maximus, in particular, adds that Plato referred the querists to Euclid; which must be an anachronism. However this may be, the problem continued to furnish an unceasing object of research; and such was the importance of its solution in the eyes of Eratosthenes, that he hung up his own solution in a temple as an offering, and composed an epigram, of which the principal value now is the proof which it affords that he considered Menæchmus as the first inventor of the conic sections.

Hippocrates of Chios (known as the first who could find the area of a curvilinear figure) perceived, according to Eratosthenes, that this problem could be solved as soon as two mean proportionals could be found between the side of the given cube and twice its length: that is, A being the length of the given cube, and X and Y two lines such that

$$A : X :: X : Y \text{ and } X : Y :: Y : 2A,$$

this geometer saw that X was the side of the cube double of that on A. But the new problem presented exactly the same difficulty as before: various mechanical curves (as they were called) were invented for the purpose it was found that the conic sections were sufficient, but no solution appeared consistent with the restrictions implied in the postulates of Euclid.

Eutocius has mentioned the solution of Eudoxus, and has preserved those of Plato, Hero, Philo, Apollonius, Diocles, Pappus, Sporus, Menæchmus, Archytas, Eratosthenes, and Nicomedes. Pappus himself (in the third book, the first of those which remain entire) has preserved the solutions of Eratosthenes, Nicomedes, and Hero. In several instances these notices are the only clue which we have to the dates of the investigators, as there is strong presumption that those who are named by Eutocius and not by Pappus lived between the two.

The trisection of the angle [TRISECTION] offered difficulties of a similar kind, and engaged the attention of several of the individuals above mentioned. That of the quadrature of the circle is altogether of another kind. For the various solutions of the problem of the duplication, see Montucla, *Histoire des Recherches sur la Quadrature du Cercle*, 2nd edition, Paris, 1831; or Reimer, *Historia Problematis de Cubi Duplicatione*, Göttingen, 1798; or the works of Eutocius and Pappus already cited.

The importance of this problem declined with the rise of the decimal arithmetic. Many different attempts were made, some avowedly mechanical (as opposed to geometrical), others by those who imagined they could overcome the original difficulty. Any process for the solution was called *mesolabum* (a term as old as Vitruvius). One of the last was that of the celebrated Vieta, containing an error, which is the more remarkable, that little, if any, notice has ever been taken of it. (See his works, Schooten's edition, page 273.)

DUPUIS, THOMAS SAUNDERS, Mus. D., the composer of much good music for the chapels-royal, and a very distinguished organist, was born in London in 1733, and received his education in the royal chapel, of which he became organist and composer on the death of Dr. Boyce in 1779. In 1790 he was admitted to the degree of doctor in music by the university of Oxford, and died in 1796. After his death a selection from his works was published in two volumes, by his pupil, John Spencer, Esq., nephew and son-in-law of the late duke of Marlborough; but many of his best productions still continue in manuscript, and remain buried in the books of the king's chapel, among several other compositions of the most undisputed merit.

DUPUIS, CHARLES-FRANÇOIS, was born of poor parents, at Fryé-Château, between Gisors and Chaumont, on the 26th of October, 1742. His early instructions were due to his father, who, though in very humble circumstances, appears to have been a man of some learning and considerable intelligence; and the early turn of mind in young Dupuis was very decidedly to mathematics and astronomy. It was his good fortune to become known while yet a boy to the Duc de Rochefoucault, who procured him an exhibition to the college of Harcourt. His studies here took a new direction, and he made such rapid progress in them as to secure the highest opinion of the professors of the college, and gave promise of distinction in future life.

Before the age of twenty-four, he was appointed professor of rhetoric in the college of Lisieux; and having sufficient leisure allowed him by his duties, he completed his course of law studies, and in 1770 was admitted an advocate of the parliament. Being directed by the rector of his university to pronounce the discourse on the distribution of the prizes, this led also to his being nominated to deliver the funeral oration, in the name of the university, on the queen Marie-Thérèse. With these his literary reputation commenced, and they are considered good specimens of purity and elegance in Latin composition.

The nature of his literary pursuits again led him into contact with the subjects of his early study; and profiting by the lessons and the friendship of Lalande, he entered upon the study of astronomical history with a zeal which never abated to the close of his life. His attention was especially directed in the first place to the probable signification of the astronomical symbols which constituted the signs of the zodiac; and thence to all the other ancient constellations. His active mind, however, even in the midst of these deeply interesting speculations, was alive to other objects; and among his amusements was the construction of a telescope, founded on the suggestions of Amontons, by means of which, from 1778 to the commencement of the Revolution, he carried on a correspondence with his friend M. Fortin, who was resident at Bagneux, he himself being located at Belleville. This mode of correspondence he however very prudently laid aside, lest it should lay him open to suspicion from the factions that then governed France.

In 1777 and 1778 he published in the 'Journal des Savans' the first sketches of the theory at which he had arrived; and shortly after, both in the astronomy of his friend Lalande, and in a separate 4to. volume under the title of 'Mémoire sur l'Origine des Constellations et sur l'explication de la Fable par l'Astronomie,' 1781. The sceptical tendency of the views entertained by Dupuis led Condorcet to recommend him to Frederick the Great, as professor of literature in the College of Berlin, and successor to Thiébauld; and the offer was accepted by Dupuis. The death of Frederick, however, prevented the arrangement from being carried into effect; but the chair of Latin eloquence in the College of France becoming then vacant by the death of Bejot, he was appointed to fill it. In the same year (1778) he was named a member of the Academy of Inscriptions, and was appointed one of the four commissioners of public instruction for the department of Paris. The danger of his residence in the capital now induced him to seek a retreat at Evreux. He was, notwithstanding his retirement, named member of the Convention for the department of Seine-et-Oise; and was remarkable for the moderation of his views. Caution was the characteristic of his political career. In the year II. he was elected secretary of the Assembly; and in the following year a member of the Council of Five Hundred. He was elected one of the forty-eight members of the French Institute, though after much determined and discreditable opposition from the ultra-revolution party. On the 18th Brumaire, year IV., he was elected by the department of Seine-et-Oise their member of the legislative body, and soon after president of that assembly, and ultimately was nominated a candidate for the senate. Hopeless of the regeneration of France, he retired at once from public life, and devoted the remainder of his days to the investigations of the questions which arose out of his early speculations. We have hence to trace his progress only as a man of letters and a man of science, and to give some general idea of the views which are contained in his several works.

On the publication of the 'Mémoire sur les Constellations' a new course of erudite inquiry was opened; and though the arguments and conclusions were contested by Bailly, he gave Dupuis full credit for the ability and learning displayed in the work. He afterwards renewed his researches, and made them the subject of a course of lectures delivered from his chair in the college of Lisieux. In 1794 he published his great work entitled 'Origine de tous les Cultes, ou la Religion Universelle,' 3 vols. 4to. with an Atlas; and also, slightly abridged in one of its parts (the 'Justification'), in 12 vols. 8vo. This work gave rise to much discussion, often conducted with a sectarian bitterness little creditable to philosophical or theological investigation. In 1798 he published an abridgment of the 'Origine' in one vol. 8vo., or rather a series of extracts from his large work, under the

same title; but a much more methodical abridgment was shortly after given to the world by Destutt-de-Tracy.

The wildly-displayed hatred towards Christianity which so strongly developed itself during the eventful period of the French revolution was well calculated to create deep interest in the work of Dupuis. He had been led to conclude that the earliest traces of the general mythology of the southern climates would be found in Upper Egypt, if indeed they had not their origin there. In this celebrated work, therefore, originated the 'Commission' to explore the ruins of that country, which was undertaken by Napoleon after his return from Italy. Nothing indeed can show so clearly the influence which this work had exercised over the 'regenerated nation,' as that the most ambitious of all the men of his time should leave the scene of the most glittering hopes to a daring spirit like his, to lead an expedition such as this. Out of that expedition what new and unexpected results have arisen! The very phraseology of history has been changed; and the sacred rites and domestic manners of antient Egypt are now scarcely, if at all, less understood than those of Greece and Rome.

The Zodiac of Tentyra (or Denderah) engaged much of the attention of Dupuis, upon which he published a *mémoire* and an *explication*, in the 'Revue Philosophique' for May 1806, which he afterwards published in an enlarged and separate form in one volume 4to, under the title of 'Mémoire explicatif du Zodiac Chronologique et Mythologique.' In this curious dissertation he compares the Greek and Egyptian Zodiacs with those of the Chinese, the Persians, the Arabs, and all the others of which he could obtain any distinct notices. He afterwards read to his class of the Institute a 'Mémoire sur le Phénix,' which, as he contended, signified the reproduction of the cycle of 1461 common (vague) Egyptian years. In the 'Nouvel Almanach des Muses' for 1805 he also published a fragment of the poem of Nonnius; it is indeed said that his astronomical system was suggested by this poem originally, and it is certain that his 'Origine des Cultes' is but a voluminous commentary on the ideas contained in that poem.

Dupuis died at Is-sur-Tille, on September 29, 1809, aged 67. He was a member of the Legion of Honour. He was a man of strict probity, and much esteemed by his friends for his personal qualities. He amassed no fortune, being satisfied to expend his income upon the materials for his researches.

He left in MS. a work on cosmogonies and theogonies, intended as a defence and illustration of the doctrines of the *Origine des Cultes*. In this work Leblond considered that Dupuis had at last discovered the interpretation of the Egyptian hieroglyphics—a conclusion that few, since the researches of Dr. Young and Champollion, will feel disposed to admit, even though they may not adopt the views of Champollion to any great extent. There is also reason to believe that it was in consequence of conversations with Dupuis that Volney composed his celebrated work on the Ruins of Empires.

Dupuis has been often stigmatized as a paradoxical writer. Bold and speculative he was, but there is certainly little cause to call him paradoxical. His conjectures are often plausible, though his deductions from them are frequently inconsequential. Whatever might have been the immediate effect of his scepticism, there can be little doubt that the ultimate effect has been alike favourable to early history and to the Christian religion. He was a sincere and candid man, and always appeared to be fully impressed with the truth of the conclusions at which he had arrived. It was indeed that earnestness of character that gave so much weight to his opinions and so much influence to his suggestions. Had this feature been wanting in the character of Dupuis, the expedition to Egypt had never been undertaken, nor, consequently, would the brilliant discoveries to which it finally led have been made.

DURA MATER. [BRAIN.]

DURAMEN, the name given by physiologists to the central wood or heart-wood in the trunk of an exogenous tree. It is the oldest part of the wood, and is filled by the secretions of the tree, so that fluid can no longer ascend through its tubes, which are choked up by the deposition of solid matter; otherwise it is of the same nature as the alburnum. It is only where plants form solid hard secretions that heart-wood is distinguishable from sap-wood: in the poplar, willow, lime, &c., no secretions of this kind are formed; the two parts of the wood are both nearly alike,

and consequently the timber of such trees is uniformly perishable. Ship carpenters call the duramen the spine: it is always distinguishable from sap-wood by its deeper colour, and sometimes, as in the yew, the sandarach, and certain kinds of deal, the limits of the two are clearly defined. But in most cases the heart-wood and sap-wood gradually pass into each other, so that no certain line can be drawn between them.

DURANCE, a river in the south of France, belonging to the basin of the Rhône. The source of the Durance is marked in the maps near Briançon; but the sources of the Guisane and the Claret, which flow from the ridge of the Alps that separates the department of Hautes Alpes from Savoy, have each a better title to be considered the true head of the Durance. These streams unite at Briançon, about 20 miles from their respective sources, and just after their junction receive the Servièrres, another small stream. From Briançon the Durance flows south-south-west above 25 miles to Embrun, receiving by the way the Gyronde (which receives the Gy and the Boude) and the Guil (which receives the Aigue-blanche, the Melesen, and the Rioubé), and several small mountain streams, as the Crevoux, the Vachère, &c. The Ubaye, from Barcelonette (which receives the Ubayete, and the Bachelard), joins the Durance 10 miles below Embrun. From the junction of the Ubaye the Durance flows first south-west, then south, and then west by north 135 miles, into the Rhône below Avignon, receiving a great number of tributaries, of which the principal are the Buech (which joins it at Sisteron), the united streams of the Bes and the Bleone from Digne, the Asse, the Verdon from Castellane, and the Calavon from Apt. In the lower part of its course the bed of the Durance is full of islands. The stream is very rapid, and its inundations frequent. It is not navigable, but is used for floating timber. Many of its tributaries are used for floating. It was known to the Romans by the name Druentia.

DURANGO, a town in the Mexican United States, the capital of the state of the same name, is situated in about 24° 28' N. lat. and near 105° W. long. in a wide plain, 6848 feet above the sea, and at no great distance from the Sierra Madre, which rises to the west of the town. Its population amounts to upwards of 22,000 souls, and it carries on a considerable commerce in the agricultural produce of the country lying about it, and in that of the numerous and rich mines, partly situated in the Sierra Madre and partly east of the town. Iron ore is found within a quarter of a league from the town, but the attempts to turn it to advantage have, so far as we know, not succeeded to any extent. Not far from Durango is the Breña, a tract more than 30 miles in length and about half that width, which is occupied by hills composed of basalt and covered with scoria; among them is a crater of considerable dimensions. (Humboldt; Ward.)

DURANTE, FRANCESCO, a celebrated Italian composer, was born in Naples, in 1693, and educated under Alessandro Scarlatti. His works are not numerous, and chiefly of the sacred kind. The duets, on which his reputation now mainly rests, are, Dr. Burney states, the cantatas of his master, arranged for two voices! Hence the fame of this much-vaunted composer will hereafter depend on that of his disciples, Pergolesi, Piccini, Sacchini, Paisiello, &c., who received instruction from him at the Neapolitan Conservatories of *St. Onofrio*, and the *Poveri di Gesù Cristo*, of both of which Durante was the principal.

DURA'ZZO, DURA'S, the antient Epidamnus, afterwards called Dyrrachium, is a town on the coast of Albania, in 41° 22' N. lat., and 19° 27' E. long., situated on the south coast of a peninsula which projects into the Adriatic, and forms the south boundary of the gulf of Drin. Epidamnus was a colony of Coreyra [COLONY], but it afterwards changed its name into Dyrrachium. It fell under the Romans at the time of the conquest of Macedonia, and its harbour became the principal means of communication between Italy and the north parts of Greece, Macedonia, and Thrace. The Romans embarking at Brundisium, which is nearly opposite, landed at Dyrrachium, and thence by the Via Egnatia they reached Thessalonica, on the *Ægean* sea. Pompey defended Dyrrachium with success against Cæsar before the battle of Pharsalia. After the fall of the Roman empire Dyrrachium came successively into the hands of the Goths, Bulgarians, and the Normans from Sicily, who made it their stronghold in their wars with the Byzantine emperors. It afterwards fell into the hands of

the Venetians, from whom it was taken by sultan Bayazid II. Durazzo is now included in the pachalik of Skutari, near the borders of that of Berat. It carries on some trade by sea, and exports the surplus corn which grows abundantly in the neighbouring plains. Its population is reckoned at between 4000 and 5000, and it has a Greek bishop. It is a place little visited by travellers: the scanty remains of Apollonia, which are two short days' journey to the south of it, near the banks of the Apsus, have been described by Colonel Leake and Dr. Holland. (Leake's *Travels through Northern Greece*.) Leake was prevented by illness from proceeding to Durazzo.

John, the eighth son of Charles II. of Anjou, king of Naples, assumed, with the consent of the Byzantine emperor, the title of duke of Durazzo and lord of Albania; and from him sprung the Durazzo branch of the Anjous, who reigned a while over Naples and Hungary. Charles III., king of Naples, was a grandson of John; he died in Hungary, and left two children, Ladislaus and Joanna, who reigned in succession at Naples, but died both without issue.

Coins of Dyrachium.

British Museum. Actual size. Silver. Weight, 409 grains.

DÜREN, a minor circle of the administrative circle of Aachen (Aix la Chapelle), in the Prussian province of the Rhine. Its area is about 215 square miles, and it contains 1 town, 1 market village, 106 villages, and 16 hamlets, with a population of about 45,600 (1816, 37,186). The Roer traverses it from south to north-west: it is hilly in parts, and has about 128,000 acres of arable land, 18,330 of meadows and pastures, and 51,700 of woods and forests. It produces much grain and fruit, rears cattle, contains iron, lead, alum, and coal mines, and manufactures woollens, ironware, paper, vegetable oil, &c.

DÜREN, the chief town, called by the Romans *Marcodurum*, whence its former name of *Mark-Düren*, lies near the banks of the Roer, 50° 46' N. lat. and 6° 36' E. long. It is a walled town, the seat of a public mining-direction, possesses a Roman Catholic gymnasium or high school, three nunneries, five Catholic and two Protestant churches, and a synagogue, and contains about 6800 inhabitants: in 1818 their numbers were 4909; and in 1825, 5610. Düren has considerable manufactures of fine and ordinary woollen cloths, stuffs, and coverlids, which employ between 1200 and 1300 hands, as well as of screws and nails. There are also manufactures of iron and steel ware, paper, coarse cottons, soap, leather, oil, trinkets, &c. It has an extensive trade in grain, a horse market, and three large fairs in the course of the year. On this spot several cohorts of the Ubii, who had assumed the Roman name of *Agrippinenses*, were surprized and cut to pieces by Civilis, the Batavian leader, in the year 70 A.D. (Tacit. *Hist.* iv. 28.)

DÜRER, ALBRECHT, or ALBERT, born at Nürnberg the 20th of May, 1441, was the son of a skilful goldsmith, and received that sound education which the wealthy burghers of the free towns of Germany were accustomed to give to their children. In all branches of instruction Albrecht made great progress, and showed also much ingenuity in the profession for which he was intended; but his genius being bent towards a nobler art, he gave up at once, to the great vexation of his father, the working of gold, and placed himself under the most able painter of his native country, Michael Wohlgemuth (1486). After finishing his apprenticeship he set out on his travels, and in 1490 went through Germany. On his journey he painted portraits and other pictures which were highly admired. Improved by experience and with increased reputation, he returned home in 1494, and soon after executed his master-piece, a drawing of Orpheus. It was the custom of those times for a painter, in order to be received and acknowledged as a master, to exhibit a piece which merited the approbation of his teacher and of the other masters of his craft. When this was accomplished, the candidate received a kind of diploma, and was entitled to the honours and rights of a master.

After obtaining the mastership Dürer visited Holland and Italy, where he executed some of his best pictures such as the *Martyrdom of St. Bartholomew* for the church of St. Mark, and *Adam and Eve* for the German church in Venice, which was afterwards bought for the Gallery of Prague. In Bologna he became acquainted with Raphael, who esteemed him highly. In token of their friendship, each presented the other with his portrait. He returned home in 1507, with the reputation of being the first painter of his country.

'Certainly,' says Vassari (*Vite de' Pittori*), 'if this diligent, industrious, universal man had been a native of Tuscany, and if he could have studied as we have done in Rome, he would have been the best painter in our country, as he was the most celebrated that Germany ever had.'

His productions were so highly valued as to attract the notice of the most powerful sovereigns of his time, Maximilian the First and Charles the Fifth, who appointed him their painter, and bestowed upon him riches and honours.

To please his father Dürer had married, against his inclination, the daughter of a wealthy neighbour; but the match turned out so unfortunate that it embittered his life, and his countrymen attributed his premature death to his domestic misfortune. It is said that his wife was not deficient in personal attractions, but peevish and jealous to the utmost degree. He died broken-hearted in 1528, in the 58th year of his age. The senate of Nürnberg, to honour the memory of their illustrious citizen, decreed him a public funeral, which was celebrated with great pomp and solemnity. This circumstance has led some of his biographers to suppose that Dürer died in poverty, which however was not the case. In spite of his liberality, he left a tolerably good fortune to his surviving Xantippe.

Dürer's paintings are admired for the vivid and fertile imagination, the sublime conception, and the wonderful union of boldness and correctness of design which they display. He was the first man in Germany who taught the rules of perspective and the proportions of the human body according to mathematical and anatomical principles. In fact, his works were in this respect so classical, that even his prints and wood-cuts were purchased by the Italian painters for their improvement in those branches.

Some critics have found fault with the unnecessary correctness of drawing and the exuberance of his imagination; but the only fault that can be really objected to him is his total neglect of costume. Yet this fault is more conventional than real. His pictures, in spite of this violation of the rules of taste, produce lasting impressions of the sublime and beautiful; and impartial judges must always honour in him the greatest master of the German school.

Besides his great historical paintings, the best of which are in the collections of Vienna, Prague, Munich, and Dresden, Dürer has left some landscapes that are highly valued. Some of his paintings were in England in the collection of Lord Arundel. Dürer was also an excellent engraver in copper and wood; his woodcuts are masterpieces of the art, and considered equal to those of Hugo da Carpi.

The best among his woodcuts, both in respect of invention and execution, are his greater *Passion* and his *Revelation of St. John*. So much were they sought after, even during his lifetime, that a Venetian artist was induced to counterfeit them. When Dürer heard of this forgery, he went to Venice, and commenced a suit against the man, whose name was Marc Antonio Franci. The senate of Venice would have punished the offender severely, if Dürer had not obtained his pardon. There is a volume containing more than 200 original drawings by Albert Dürer in the print-room of the British Museum, which formerly belonged to the collection of Sir Hans Sloane, and was probably part of the celebrated collection of Dürer's friend W. Pirkhamer. In the same room is preserved an exquisite carving by him, in hone-stone, of the *Birth of St. John*, bequeathed to the Museum by Mr. R. P. Knight, who had purchased it at the price of 500*l.* It is dated 1510.

An extensive collection of Albert Dürer's engravings was bequeathed to the British Museum by the late Mr. Nallekens.

Dürer's portraits were also highly esteemed: it was said of him that he not only possessed the talent of catching the exact expression of the features, but also of delineating the different characters and passions.

Two inventions are attributed to him; that of printing woodcuts in two colours, and that of etching. Some, how-

ever dispute his claim to the invention of the art of etching, though it is not denied that he was the first who excelled in it.

In his private life he was amiable, upright, and benevolent. He was a strong supporter of the Protestant religion, without making any pretensions to superior piety.

Dürer wrote several valuable works on geometry, perspective, and fortification. He bestowed such labour on the purity of his native tongue, that his writings even now are well worth the study of the German scholar.

While the French corruption of taste was exercising a baneful influence over the fine arts, Dürer was looked upon as a barbarian; but opinion is now changed, and the modern school of German painters and critics view him as one of their great masters, and as a model by following which the art of painting may be brought back to its former dignity.

His life has been written by Arend and Roth, and lately by Heller, who has given the most critical and complete catalogue of all his works. Goëthe, Tieck, Wackenrode, and other distinguished writers have vindicated his claims.

D'URFEY, THOMAS, was born in Devonshire, but the exact time of his birth is uncertain. He was designed for the law, but quitted that profession for poetry. His dramas had remarkable success in the days of Charles II., but were soon afterwards banished from the stage on account of their outrageous indecency, and at present scarcely their names are known, except to the students of English dramatic history. Much of his fame was owing to his songs and satirical odes, which he is said to have himself sung in a lively and agreeable manner. He is represented in the 'Guardian' as being on such terms of intimacy with Charles II., that the king would sometimes lean on his shoulder and hum tunes with him: he was also a favourite at most convivial parties, and was so much celebrated for his qualities as a good companion, that it was considered a kind of honour to have been in his company. He was reduced to great distress in the latter part of his life, and applied to the managers of the theatre, who performed for his benefit one of his comedies. The profits which were acquired seem to have been sufficient to render his last days comparatively easy, if any judgment is to be founded on his poems of this period, which are written with liveliness. He died in 1723, and was buried at St. James's, Westminster.

A collection of D'Urfe's poems, entitled 'Pills to purge Melancholy,' is extremely rare, and sells for a high price. It is much esteemed by those bibliographers who think licentious works valuable if they are but scarce.

DURHAM, an English county, consisting of the main part, between the rivers Tyne and Tees, and of three detached portions, which are separated from the main portion by the intervening county of Northumberland, or by that of York. 1. The main portion is bounded on the north and north-west by Northumberland, from which it is for the most part separated by the river Tyne and its tributaries, the Stanley Burn and the river Derwent; on the west it is bounded by Cumberland and Westmoreland, from the former of which it is partly separated by the Crook Burn, a feeder of the Tees, and from the latter by the Tees itself; on the south it is bounded by Yorkshire, from which it is separated throughout by the river Tees; and on the east it is bounded by the German Ocean. Its greatest length is from east to west, from Seaton Snook, a headland at the mouth of the Tees, to the junction of the Crook Burn and the Tees, on the boundary of the three counties of Cumberland, Westmoreland, and Durham, 48 miles; its greatest breadth, at right angles to the length, is from the fort at the mouth of the Tyne, at South Shields, to Stockburn, or Sookburn, on the Tees, 39 miles. 2. The principal detached part, consisting of Northamshire and Islandshire, which latter includes Holy Island and the Farne Isles, is bounded on the north by Berwick bounds, from which it is separated by the Tweed; on the north-west and west by Berwickshire in Scotland, from which also it is separated by the Tweed; on the south by Northumberland, and on the east and north-east by the German Ocean. The form of this portion of the county approaches that of a triangle, of which one side faces the north and north-west, and is nearly 11 miles long in a straight line; another, the north-east, and is 14 miles long in a straight line; and the third, the south, and is 17 miles long in a straight line. 3. The second detached portion, comprehending the parish of Bedlington, sometimes called Bedlingtonshire, is bounded on the north, west,

and south by Northumberland, from which it is separated on the north by the river Wensbeck, on the south by the river Blyth, and on the east by the German Ocean. It is 7 miles long from east to west, and 4½ miles broad from north to south. 4. The third detached portion, the parish of Craike, is near Easingwold, in Yorkshire, and is surrounded by that county: it is 3 miles long from north to south, and about 2½ miles broad. The areas of the several portions, as found by taking the areas of the several parishes, are as follows:—

| | Statute Acres. |
|--|----------------|
| Main portion | 621,696 |
| Northamshire and Islandshire | 45,630 |
| Bedlington parish | 8,910 |
| Craike parish | 3,300 |
| | <hr/> 679,530 |

The area of the whole is about 1097 square miles. The population in 1831 was 253,910, giving 231 to a square mile in size and in absolute and relative population Durham is below the average of the English counties. Durham, the capital of the county, is on the Wear, 235 miles in a straight line north by west of London; 259 miles by the road through Baldock, Stamford, Doncaster, Boroughbridge, and Bishop Auckland; or by that through Boroughbridge, Northallerton, and Darlington; or 263 miles by the road used by the Thurso, Edinburgh, and York mail, through Ware, Huntingdon, Stamford, Doncaster, York, Easingwold, Thirsk, Northallerton, and Darlington. The main portion of the county is comprehended between 54° 27' and 55° 1' N. latitude, and 1° 8' and 2° 21' of W. longitude.

Coast, Islands, &c.—The coast of the county of Durham is for the most part low, especially in the detached portions of the county. Islandshire has no cliffs, neither has Bedlingtonshire. From Islandshire sand banks (Fenham flats) run out and connect Holy Island with the main land, so as to render the island accessible at low water to vehicles of all kinds; though the sands are dangerous to persons not acquainted with them. In the main portion of the county there are several ranges of cliffs, as at Suter Point, between the Tyne and the Wear; along the coast from the Wear southward to Hawthorn Dean; again along the coast for three miles south from Horden Point, at the headland on which Hartlepool stands; and again at Seaton Bents. All these cliffs are of magnesian limestone, except those at Seaton Bents, which are formed by rocks of the red marl or new red sandstone formation.

Holy Island is of an irregular form, nearly 4 miles long from east by south to west by north, and nearly 2 broad from north to south. It contains 3320 acres, and had in 1831 a population of 836 persons. This island was called by the Britons *Inis Medieante*, and was afterwards known by the name of *Lindisfarne*: its name of Holy Island was given to it from its having been the residence of several of the fathers of the Saxon church. It was antiently the seat of a bishoprick, and had a monastery under the government of the bishops, which was subsequently reduced to be a cell of the Benedictine monastery of Durham. The church of the monastery is now in ruins. The soil of the island is rich, but before the inclosure of the common in 1792 there were only forty acres under tillage, and that portion was subject to intercommonage as soon as the crops were reaped. There is a small village or town on the west side, formerly much more extensive: the inhabitants are chiefly engaged in fishing. There is a small harbour and an old castle, which during the last war was occupied by a garrison sent from Berwick. This castle is upon a lofty rock of whinstone, in the south-east corner of the isle. On the north-east side of the island is a projecting tongue of land a mile long, and in some parts only sixty yards broad, occupied by rabbits; on one side of this tongue the tide may be seen ebbing while it is flowing on the other.

The Farne Islands lie to the south-east of Holy Island. The group consists of several small islets or rocks, some of which are visible only at low water. They produce kelp, and some of them a little grass. There are two lighthouses on two islets of the group.

Surface, Hydrography, Communications.—Durham may be characterized as a hilly county. The western part is overspread by the branches of the great Pennine Chain, from the eastern slope of which the chief rivers of the county flow. The two principal branches of this chain,

which belong to Durham, are separated from each other by Weardale, the valley of the Wear; from the Yorkshire hills by Teesdale, or Teasdale, the valley of the Tees; and from those of Northumberland by the valley in which the Derwent, a feeder of the Tyne, flows. Large portions of the mountain district consist of moor-lands covered with heath, or, as it is here termed, 'ling.' The hills north of Weardale have the name of Weardale Forest, and those north of Teasdale are called Teasdale Forest; but they are bare of wood.

The principal elevations in the county are Kilhope Law (2196 ft.), Cross Ridge, Bolts Law, Baron Hope, Collier Law (1678 ft.), and FATHERLY FELL, in Weardale Forest; Pike Law, West Pike, Manner Gill Fells, and Eglestone Bank, in Teasdale Forest; Pontop Pike, on Lanchester Common, south-east of the valley of the Derwent (1018 ft.); Down Hill, Lizard, Fulwell Hill, and Boldon Hill, near the sea, between the Tyne and the Wear; Maiden's Paps, Warden Law, or Wordeslow (632 ft.), Low Hills, Hare Hill, and Hartmoor, near the sea, between the Wear and Hartlepool; Wheatley Hill, north-east of Durham; and Brandon Mount, south-west of the same city, but on the north side of the valley of the Wear (875 ft.).

The moors are chiefly occupied as pasturage for sheep of the black-faced or heath kind, and for a few young cattle and horses. The best wooded part of the county is the vale of Derwent, which is especially adapted to the growth of oak; but it produces also ash, elm, birch, and alder, and a quantity of underwood, especially hazels.

The chief rivers are the Tyne, the Wear, and the Tees, with their tributaries. The Tyne drains the northern parts, the Wear the middle, and the Tees the southern.

The Tyne [NORTHUMBERLAND] forms the northern boundary of the county for about 18 miles, from the junction of the Stanley Burn at Wylam to the sea, and its navigation extends from above Newcastle to the sea, a distance of about 15 miles. Its Durham affluents are the Derwent and Team rivers and the Stanley and Hedworth Burns.

The Derwent rises in Northumberland, and flowing east, reaches, about 3 miles from its source, the border of Durham, along which it flows, first east and then north-east, then south-east, and then north-east again for 16 or 17 miles, receiving on its right (or Durham) bank the Nuckton, Boltshope, Baronhope, Hysop, and Herselop Burns, or Becks (i. e. small streams; the last two unite before entering the Derwent); and on its left (or Northumberland) bank many others. At the junction of the Milk or Milch Burn it leaves the border (which here turns off to the north), and flows through the county for about 9 miles north-east, till it again meets the border, and falls into the Tyne 3 miles above Newcastle. Its whole course is 28 to 30 miles.

The river Team rises on the side of Pontop Pike, and flows first east-by-north and then north-by-west about 13 miles into the Tyne, about a mile above Newcastle. The Stanley Burn and the Hedworth Burn are only four or five miles long.

The Wear rises near Kilhope Law, and flows east and south-east above 4 miles to Burtree or Bowertree Ford. In this part of its course it is known as the Kilhope Burn, and is joined by the Welhope and Burnhope, and some other burns. From Bowertree Ford the Wear flows east-by-south 18 miles to the junction of the Bedburn river, passing the towns of Stanhope and Wolsingham, and receiving on the right bank the Irshope, Harthope, Dadree, Swinhope, Westenhope, Snowhope, and Bollihope Burns (the last of which receives the Harehope); and on the left bank the Middlehope, Rookhope, Stanhope, Shittlehope, Wescrow, Houslip, and Eals Burns, all of which are small. The Wescrow receives the Tunstall and the Thornhope. The Bedburn river is formed by the junction of the Euden and Sharnberry Becks, and subsequently of the North Grain Beck, and another to which the maps give no name. This upper part of the course of the Wear is through the wild and romantic district of Weardale, bounded on each side by high hills. From the junction of the Bedburn the Wear flows still east-by-south 6 miles to Bishop Auckland. In its way it is joined on the right by the Lin Burn, on the left by the Bitch Burn, and at Bishop Auckland by the Gaunless, which rises on Eglestone Common, and has a course of 15 miles. The Gaunless, near its source, is called the Hyndon Beck: it is joined in its course by the Humber Beck. From Bishop Auckland the Wear turns to the

north-east, and flows in a very winding course about 36 or 37 miles past Durham and Chester-le-Street into the German Ocean at Sunderland. Between Bishop Auckland and Durham it receives the Croxdale Beck and the Shinkly river on the right bank, and the Stockley Beck and the Browney river on the left. The Browney river is the largest of these; it rises on Satley Common, and flows first east and then south-by-east 17 miles, receiving the Pan, the Smallhope, and the Derness (which is joined by the Hedley) Becks. Below Durham the Wear receives the Stanley Burn, united with the Cock Burn on the left bank, and the Lumley Burn on the right bank, all at or near Chester-le-Street. The whole course of the Wear may be estimated at about 65 miles, for about 18 or 20 of which, viz. up to the city of Durham, it is navigable. It is crossed at Sunderland, near its mouth, by an iron bridge of one arch, of 236 feet span and 100 feet above high water-mark. The importance of its navigation arises from the export of coals from the neighbouring mines, for the produce of which it furnishes an outlet. London and many towns upon the Thames and on the eastern coast receive a considerable portion of their supply of coals from the Wear.

The Tees rises in Cumberland, on the slope of Cross Fell (2901 feet high), and for the first few miles of its course forms the boundary between Cumberland and Westmoreland. It is joined by the Trout and Crook Becks, and upon its junction with the latter forms the boundary of the county of Durham, separating it for a very few miles from Westmoreland, and throughout the remainder of its course from Yorkshire. The general direction of the Tees till it reaches Sockburn, nearly 55 miles from its source, is east-south-east; from thence it flows nearly 30 miles north-east into the German ocean, its total course being between 80 and 90 miles. The first part of the course of the Tees to Barnard Castle is pretty direct; it flows through a narrow valley in a hilly country, and is swelled on the right or Westmoreland and Yorkshire bank by several becks, or small rivers, of which the chief are the Maize or Marys, the Lune, and the Balder or Baulder: on the left or Durham bank it receives the Harwood joined with the Langdon Beck, the Ettersgill, the Bowles, the Hadshope or Hudshope, the Eglestone, and one or two others. The valleys watered by these several affluents of the Tees open laterally into the valley of the Tees, and are many of them remarkable for picturesque beauty. A ridge of trap rocks across which the river flows at Caldron Snout, at the junction of the Maize or Marys Beck, forms a series of falls in a distance of 596 yards which offer a fine contrast to the still water of The Wheel, a pool or lake into which the river expands just above. At High Force, or Mickle Force, a few miles lower down, another ridge of coarse-grained grey columnar basalt crosses the river, and causes another fall of 56 feet. A few miles below this fall and three above the village of Middleton in Teasdale, basaltic rocks form the bank of the river, and serve to support Winch Bridge, which consists of a plank two feet wide, with low handrails, suspended by iron chains across the river, here 63 feet wide, at an elevation of 56 feet above the water. Below Barnard Castle the course of the river is still tolerably direct till it reaches the neighbourhood of Darlington. It receives in this part of its course, on the right bank, the Greta from Yorkshire, and on its left bank, the Grand River, or Staindrop Beck, 10 or 12 miles long, which flows through Raby Park and past the town of Staindrop, receiving the Forth or Sut Beck. From the neighbourhood of Darlington the channel winds very much. At Croft near Darlington it receives a considerable stream on its right bank, and on the left the river Skerne, which, rising between Durham and Hartlepool, has a very winding course to the south-south-west, of more than 25 miles, receiving several streams by the way, and passing the town of Darlington just before its junction with the Tees. The Tees does not receive any considerable affluent after the Skerne, except the Leven from Yorkshire. It passes the town of Stockton, below which it receives the Hartburn and Billingham Becks, and at Greatham Fleet, near its mouth, the Elmdon Beck united with another from Greatham. The wide estuary of the Tees is navigable for colliers and other large vessels up to Stockton, and for small craft several miles higher up, above Yarm in Yorkshire: the navigation has been shortened by a cut, by which a considerable bend in the river is avoided.

There are several small streams which flow into the sea between the Wear and the Tees. They are called *Deans*.

as Ryhope Dean, Seaham Dean, Dalton Dean, Hawthorn Dean, Castle Eden Dean, and Hasledon Dean.

The river navigation of Durham, comprehending only the lower waters of the Wear and of the border rivers Tyne and Tees, is confined to the eastern side of the county. There are no canals or artificial cuts, except one, already noticed, made to shorten the winding course of the Tees.

The mail-road to Edinburgh, Aberdeen, Inverness, and the north of Scotland, crosses this county from south into north. It enters it at Croft Bridge over the Tees, and passes through Darlington, 241 miles from town, Durham (259 miles), Chester-le-Street (265 miles), and Gateshead (272 miles), where it quits the county, crossing the Tyne to Northumberland. There are two other roads from London to Durham city: they branch off from the Glasgow and Carlisle mail-road at Scotch Corner in Yorkshire, and enter the county by Pierce Bridge over the Tees (239 miles from London). Here they divide, the right-hand road passing through the villages of Heighington and Eldon, and the left-hand road through Bishop Auckland (248½ miles from London). They reunite a few miles beyond Bishop Auckland and fall in with the Edinburgh mail-road near Sunderland Bridge, over the Wear, about four miles before reaching Durham (259 miles).

The road from London to Sunderland branches off from the Edinburgh mail-road at Thirsk in Yorkshire, and proceeding by Yarm, upon leaving that town crosses the Tees into the county of Durham, and proceeds forward to Stockton (241½ miles from London), and from thence to Sunderland, 268½ miles. At Bishop Wearmouth, which is a suburb of Sunderland, where the road turns off to enter that town, a branch proceeding forward runs to South Shields at the mouth of the Tyne (275 miles). From this branch road another branch to the left leads to Gateshead, forming a communication (13 miles) between Sunderland and Newcastle.

From Durham roads lead to Sunderland (distant 13 miles), through Bishop Wearmouth; and by Bishop Auckland (distant 10 miles), and Staindrop (19 miles), to Barnard Castle (24 miles). From Barnard Castle (245 or 246 miles from London) a road leads along the valley of the Tees, by Middleton in Teasdale (distant 9½ miles) to Aldstone Moor in Cumberland; and from Darlington, one by West Auckland (distant 9 miles), Wolsingham (20 miles), and Stanhope (26 miles), along the valley of the Wear to the same town. From Wolsingham a road runs northward to Hexham in Northumberland and another to Gateshead. From Gateshead a road runs along the south side of the Tyne valley to Hexham. Other roads do not require notice.

Durham has numerous rail-roads, most of which have been constructed by the coal owners for the conveyance of coals from the pits to the rivers Tyne and Wear, where they are shipped. Acts of parliament have been obtained for two more extensive rail-ways; one, the Stockton and Darlington, extending from Wilton Park colliery, west of Bishop Auckland, by a circuitous line past Darlington to Stockton, and from thence across the Tees by a suspension bridge, and by the side of the navigable cut made in the Tees to Middlesbrough and Cleveland Port on that river; with various branches: the other, the Clarence rail-road, from the Stockton and Darlington rail-road, a few miles north of Darlington, by a more direct course to the northern bank of the Tees below Stockton, with a branch to the city of Durham, and some subordinate branches. The various acts for the Stockton and Darlington rail-road were obtained in 1821-1828; those for the Clarence rail-road in 1828-1829. The estimated length of the former, including its branches, is about 38 miles; of the latter, nearly 46.

Geological character.—The lower part of the valley of the Tees, from the junction of the Skerne, and the coast from the mouth of the Tees to Hartlepool, are occupied by the red marl or new red sandstone, the uppermost of the formations which are found in the county. Among the strata of the formation a fine-grained sandstone of a brick-red colour predominates. Some attempts have been made to find coal by boring through the red marl, but without success, though the pits were sunk to the depth of more than 700 feet. At Dinsdale, near Croft Bridge, where one of these attempts was made, the strata were found to be numerous, and to consist, as far as could be judged from the miners' language, of white, grey or red sandstone, with occasional partings of a more compact nature, red or blue shale, coaly matter in thin layers, and gypsum in nodules or in beds, which in one case were three feet thick: the

lowest bed in the two deepest workings was found to be a strong white rock of a calcareous nature. Sulphureted springs are found in this strata: one of them arose from a perforation made in boring for coal. (Mr. Winch, *Geol. Trans.*) The newer magnesian or conglomerate limestone crops out from beneath the north-western limit of the red marl: it extends along the coast to the mouth of the Tyne, and along the valley of the Tees to the junction of Staindrop Beck with the Tees, between Darlington and Barnard Castle: its inland boundary is a line drawn southward from the mouth of the Tyne, gradually diverging from the coast-line to the village of Coxhoe, between Durham and Stockton; and from thence south-west to the Tees. This limestone forms a range of round-topped hills along the coast, of small elevation, the highest (Painshaw, near the Wear) being estimated at only 400 feet. The upper stratum of the limestone here is a species of breccia, with which wide chasms or interruptions in the cliff are filled: the next strata are thin and slaty, of a white colour inclining to buff; but lower down the stratification becomes indistinct, the rock is of a crystalline and cellular texture, and of a light-brown colour. The brown variety is quarried near Sunderland: it partakes of the nature of limestone, and from containing some inflammable matter requires only a small quantity of coal to be reduced to lime. Some of it, which takes a tolerably good polish, is sold as marble. The thickness of the limestone formation varies. At Pallion, near Sunderland, it is only about seventy feet thick; but this is near the north-western or under boundary: near Hartlepool it has been bored to the depth of more than 300 feet without penetrating through it. Along the coast the strata dip to the south-east. Galena is the only ore that Mr Winch observed in this limestone, and few organic remains are found in it. Botryoidal masses (*i. e.* masses like a cluster of grapes) of fetid limestone, devoid of magnesia, in balls varying from the size of a pea to two feet in diameter, imbedded in a soft, marly, magnesian limestone, are found near Hartlepool. There are caverns and perforated rocks in this formation along the coast, which appear to have been formed by the action of the sea.

Under the article COAL-FIELDS the reader will find a general description of the coal-field of Northumberland and Durham. The following remarks apply more particularly to the county of Durham.

Of the dykes of basalt or greenstone which intersect the coal measures, one crosses the Tyne into Durham county, near the Walker colliery, and another crosses the bed of the Wear at Butterby, near Durham. In the south part of the county is a remarkable basaltic dyke, extending several miles from Cockfield to Bolam, where the coal measures dip beneath the newer magnesian limestone: a dyke of similar kind and in just the same line intersects the new red sandstone or red marl, and crosses the bed of the Tees near Yarm into Yorkshire. 'I have never been able,' says Mr. Winch, 'to trace any of these basaltic veins into the magnesian limestone, and am almost certain that, together with other members of the coal formation, they are covered by it.' In Mr. Greenough's Geological Map of England and Wales the Cockfield dyke and that which crosses the Tees are represented as parts of one vast dyke, extending from the upper valley of the Tees near Eglestone, through the millstone grit and limestone shale (or, as it is laid down in Mr. Winch's map, the mountain limestone), the coal measures, the newer conglomerate or magnesian limestone, the red sandstone, the lias, and the inferior colite, in all sixty-five miles in an east-south-east direction, to the Yorkshire coast, between Scarborough and Whitby. The coal in contact with the dyke is charred and reduced to cinder; and the sulphur is sublimed from the pyrites near. A belt of trap rocks is marked in Mr. Greenough's map as extending across the coal measures in Bedlingtonshire. Besides the fissures filled with basalt, others of a different nature intersect the coal-field: these, if large, are also called dykes; but, if small, 'troubles,' 'slips,' or 'hitches,' and by some geologists 'faults': by these 'faults' the strata are thrown, *i. e.* raised on one side or depressed on the other, many feet. Other irregularities are observed in the coal measures, such as the depression below their proper level of large wedge-shaped portions of the strata; fissures which divide the strata, but do not alter their level; basin-formed depressions in the floors of the seams, called 'swellies' by the miners, by which the coal is materially thickened, the roof of the seam preserving its regularity; and 'nips,' where the

coal nearly disappears, the roof and the floor of the seam coming almost into contact. Mineral springs are found in various parts of the coal-field, and chalybeate springs occur in every part of it.

The coal-field of Durham is bounded on the west by the district occupied by the millstone grit. This district extends westward up the valley of the Tees to Eglestone, and is bounded by a line drawn from thence northward to Bolihope Beck, along that stream to the Wear above Wolsingham, and from thence north-west to the Derwent at Blanchland. The millstone grit extends northward into Northumberland, skirting the west side of the coal-field; and southward into Yorkshire, where it extends between the districts occupied by the newer magnesian or conglomerate limestone and the carboniferous or mountain limestone. The beds of this formation may be estimated at 900 feet thick; and this is probably short of the truth. 'The prevailing rock of this series is shale, known by the provincial name of "plate," with which various beds of sandstone, differing in hardness and texture, and, according to these differences, distinguished as freestone, hazle, whetstone, grindstone, and millstone, occur: of the latter only one bed is worked, the thickness of which is about thirty feet. This is one of the uppermost strata on the Derwent, where it crops out, and does not occur farther west.' (Phillips and Conybeare, *Outlines of the Geol. of England and Wales*.) The millstone bed is quarried on Muggleswick Fell, and between Wolsingham and Stanhope in Weardale. The grey millstones of Muggleswick are employed for grinding rye. Towards the lower part of this formation two thin beds of limestone occur, alternating with some occasional seams of coal. These coal measures are distinguished by their thus alternating with limestone from those of the principal coal formation.

The remainder of the county, west of the district occupied by the millstone grit, is occupied by the carboniferous or mountain limestone. The limestone beds in this formation repeatedly alternate with beds of siliceous grit and slate-clay, to which they bear not so great a proportion as one to three, so that it is not very easy to draw the line of demarcation between the beds of this formation and those of the millstone grit. Mr. Winch, from whose account we have largely borrowed, classes both formations under the common designation of the lead-mine measures. He estimates their joint thickness at from about 2700 ft. to 2750 ft., and the aggregate thickness of the limestone beds at 576 ft.: deducting the thickness of the millstone grit as given above, that of the mountain limestone will be about 1800 ft. or 1850 ft., of which the limestone beds amount to 570 ft.: this includes about 250 ft. of sandstone and slate-clay, lying immediately above the old red sandstone, which is the formation subjacent to the mountain limestone. The limestone beds are the most characteristic of this formation, and the most important to the miner. The bed called 'the great limestone' is from sixty to nearly seventy feet thick, and consists of three strata, divided by indurated clay. It is the uppermost bed in this formation, and crops out at Frosterly, in Weardale, between Wolsingham and Stanhope, where it is quarried in large quantities for agricultural uses and building cement, or for ornamental purposes: it is a brownish-black or dark bluish-grey marble, in which bivalve shells are imbedded. 'The scar limestone,' a lower bed, thirty feet thick, is divided into three strata like the great limestone, which it also resembles both in colour and organic remains. 'The Tyne-bottom limestone,' above twenty feet thick, is also divided into three strata: 'Robinson's great limestone' is above eighty feet thick. All the limestones of this formation appear to contain the *enocrinus*, and most of them also bivalve shells: one of them (the *cockleshell* limestone) contains oyster shells of four or five inches diameter. They seem to agree in every essential character, as well as in their extraneous and native fossils. The beds of sandstone which occur in this formation are thicker than those in the millstone grit: they are thickest towards the bottom of the series. The beds of shale, or, as it is called, 'plate,' are very numerous: they are seldom so much as forty feet in thickness, but one bed is sixty feet. Iron pyrites, imbedded in shale, is found in abundance; but owing to the high price of fuel and the great distance from any seaport, cannot be manufactured into green vitriol with any advantage. Clay ironstone is found in Teasdale; but there are no iron works in this county.

The carboniferous limestone is the great depository of the

metallic veins of the district which comprehends the great Northumberland and Durham coal-field. Lead mines abound in Weardale and in Teasdale Forest, and there are a few in the valley of the Derwent. Of the fissures which contain the lead ore, such as range from north to south are called 'cross veins,' or sometimes 'dykes'; they are generally of great magnitude, but yield very little ore: those fissures which run from south-east to north-west are most productive; they are from three to six feet wide. These cut through the cross veins, which are frequently rendered productive to some distance from the points of intersection. The hade of the veins is variable in direction and in degree where those in Weardale point east and west, they hade to the south: the strata are elevated on the side to which the veins dip. The same vein is productive in different degrees according to the bed which it traverses: the limestones are the chief depositories of ore, particularly 'the great limestone,' which is considered to contain as much as all the other beds put together: next to the limestones, the strata of sandstones called 'hazels' are to be ranked in point of productiveness, but the lead-bearing veins appear to be compressed between these hard beds. Galena is the only lead ore procured in abundance from this formation; but white and steel-grained ore are occasionally found: silver is contained in the ore in different proportions, varying from two to forty-two ounces in the ton of 21 cwt.: twelve ounces may be considered as the general average, and if eight can be obtained, the lead is worth refining. Newcastle and Stockton are the ports at which lead is shipped. (*Geological Transactions*, vol. iv.; Conybeare and Phillips, *Outlines of the Geol. of England and Wales*.)

Agriculture.—The climate of the county of Durham is mild for its northern situation. The sea, which bounds it on the east, moderates the cold in winter; and the surface, being hilly without any considerable mountains, presents many sheltered valleys, the climate of which nearly resembles that of the more southern parts of the island. The soil varies in different parts; its general nature is that of a rather strong loam. In the south-eastern part of the county northward from the mouth of the Tees, is a tract several miles in breadth, stretching along the coast towards Hartlepool, where the stiff loam is rich and productive. Next to this, to the east and north, to within a few miles of Sunderland, is a very poor thin clay, with a very hard and impervious subsoil, on which neither corn nor grass will thrive without great labour and expense. Westward of this lies a strip of excellent loam on a limestone rock, which affords the soundest pastures and the best grass, and is fit for any kind of crop. In the centre of the county there is a moist clay loam, of moderate quality, on an ochre subsoil, which gradually becomes peaty, and joins the western portion of the county towards Cumberland and Westmoreland, the whole of which last-mentioned part of the county is a poor peat or moor, chiefly covered with heath. From Barnard Castle to Darlington there is a strip bounded by the Tees on the south, which consists of a dry loam intermixed with clay. In this there are some good pastures and productive farms. In the valleys of the Tees, Skerne, Tyne, and their tributary streams, the soil is in general above the average of the district around, and consists of a good friable loam, which is cultivated at a small expense, and under good management is sufficiently profitable to the occupier.

A great part of the county lay at one time in open commons and common fields, most of which are now divided and enclosed. The moors and heaths that remain are chiefly in the poor district to the westward, and even there cultivation has spread very generally; and the wastes are profitable, in some degree, by rearing a hardy breed of sheep and cattle. The general state of cultivation throughout the county is above mediocrity; and improvements have been more readily adopted than in some more southern parts of the island. Fallows are found indispensable on the cold wet clays; but wherever turnips can be raised this useful root supersedes the old summer fallow. The fallows are usually dressed with lime, which is no doubt a proper application on cold clay soils; but the use of it has become so customary (being inserted as a condition in many leases), and is so erroneously considered as a substitute for dung, that it is often applied injudiciously, and with little or no advantage. In many old leases there was a clause to oblige the tenant to lay all his farm-yard manure on the old grass land, which effectually prevented the improvement of the arable part of the farm.

Lime being thought a sufficient manure for the arable land, the consequence was the gradual deterioration of the latter, without a proportional improvement of the meadows. But a better system has been introduced. The lime is now usually put on when old grass land is broken up or converted; and where arable land has been repeatedly limed, good rich dung is found to be more profitably employed, when ploughed in, than when used as a top-dressing for grass. There is little or no marl found in the county.

The rotation usually adopted on the better soils includes two or three years of grass, and begins invariably with turnips, well manured, and drilled according to the Northumberland method. [DRILLING.] The convertible husbandry described in the account of the agriculture of BERKSHIRE is very generally adopted by the best farmers, and found most profitable in the end.

The occupations are not, in general, very large. There are some few extensive farms; but the average size is from 150 to 200 acres of inclosed land. There are many small occupations of 40 and 50 acres, which is as small a farm as can be cultivated with profit, unless the spade husbandry be adopted, which is not yet done to any extent in this county.

The implements of husbandry have nothing peculiar in them. The ploughs are chiefly of the improved kind: the old heavy clumsy ploughs are scarcely ever seen in use. Horses are almost exclusively used for agricultural purposes; and an ox team is a rarity. It is found that oxen are more profitable when fatted at a young age for the butcher, than when used to work on the farm. Threshing-mills are common, and there is not in the northern counties that foolish prejudice of the ignorant labourers, which made many of them rise to destroy threshing-machines in more southern counties, and which still prevents the use of them where they would be highly advantageous, not only to the farmer, but also to the labourer, who would then not so often suffer the pains of rheumatism in his old age, the consequence of the continued exertions of his limbs on the threshing-floor.

Corn is sown by the drilling-machine wherever the soil is sufficiently friable, or is made so by good tillage. In heavy soils the broadcast method of sowing still prevails.

There are many rich upland meadows and permanent pastures, where cattle and horses are bred to great advantage, and where oxen and sheep are fattened by grazing; but there are very few water-meadows, although there are many situations where they might very easily be established. The quantity of hay on the upland meadows is on an average $1\frac{1}{2}$ tons per acre: 2 tons is considered a heavy crop. They have a method of drawing together the cocks of hay, when it is fit to be stacked, which saves the loading on waggons. This is done by means of a wooden frame drawn by two horses. This frame is held in an oblique position, and partly drawn under the cock so as to scrape the surface and force the hay upwards. It slides on the mown grass, and is drawn to the stack, which is made to contain ten or twenty tons. It is but slightly thatched when completed: several small stacks used formerly to be placed in various parts of a large piece of grass land, and in winter the cattle were left in the fields, and pulled the hay out of the stacks all around, sheltering themselves near them. This was a great waste of hay, and a very unequal distribution of the manure. A better system prevails now, and the cattle are kept in yards, where the dung is more carefully collected and increased with straw, and where the hay is brought as it is cut out of the stack, by which means none of it is wasted. The best meadows are mown every year, and manured every third or fourth year. Some prefer mowing and feeding alternately, which keeps the land in good heart and the herbage fine. Horses are generally considered as detrimental to the pasture; their manure is too hot, and brings coarse weeds forward. Sheep greatly improve the pastures, and are in consequence preferred.

When grass land is ploughed up and converted into arable, the practice of paring and burning the surface is very generally adopted. The first crop after this is generally turnips, which seldom fail when sown with fresh-burnt ashes. The next crop is wheat or oats; after which, if the soil is very stiff, a clean fallow succeeds; if it is lighter, another crop of turnips, which brings the land in a proper state for a regular course. This appears to be a most excellent practice, and far superior to the old Devonshire plan of taking as many crops of corn, after burning the sod, as can be made to grow. When the surface is not

burnt, the usual course is to plough the grass up in autumn, and let it lie all the winter to rot: it is then ploughed again in spring, and sown with oats: the next year it is fallowed, and prepared for the course which is thought to suit the nature of the soil.

This county is not remarkable for its gardens or orchards. The soil and climate are not very favourable to fruit-trees, and, except in the gardens of gentlemen of fortune, they are not much attended to.

There are some good oak woods, and many new plantations, where the tenure is freehold. Where it is copyhold, under the bishop of Durham, one-third of the timber, above what is required for repairs of buildings, belongs to the bishop, which is an insurmountable obstacle to planting—and where the land is held on lease, renewable every seven years on an uncertain fine, every improvement increases the sum demanded. Many of these lands have been enfranchised by Act of Parliament, with the consent of the bishop; but many still remain on the old tenure.

The cattle bred in the county of Durham are in great repute all over England and Scotland, and a great number are annually purchased at the different fairs in this county, and driven northward and southward. The Teeswater or Holderness breed is the finest of the short-horns. The cows are remarkable for the quantity of milk which they give, as well as their aptitude to fatten. The oxen are considered as the most profitable breed for stall-feeding, as they become fit for the butcher at an earlier age than most other breeds. The milkmen near London and other large towns scarcely ever have any but Durham cows, some of which will give twenty-five to thirty quarts of milk per day for several months. When they become dry they increase so fast in flesh and fat, that they are soon very advantageously disposed of. They are of a quiet disposition, and bear to be kept continually tied up in stalls; and they accommodate themselves readily to every kind of food, whether it be grass or hay, roots, grains, or distillers' wash. This breed came originally from Holland, as is asserted, and this appears probable: but it has been much improved by a careful selection of bulls to breed with. This may be attributed to a few skilful and zealous breeders. The famous Durham ox at ten years old weighed alive 34 cwt. He was slaughtered at eleven years old, in consequence of an accident by which he dislocated his hip joint; and although wasted by being eight weeks in great pain, his carcase produced 165 stones 12 lbs. net meat (14 lbs. to the stone), and above 21 stones of hide and tallow. In June, 1801, when he was five years old, the proprietor refused 2000*l.* for him, and made a great deal of money by showing him all over the kingdom for six years. (*Bailey's Agricultural View of the County of Durham.*)

The milk of the Holderness cows, although abundant, is not so rich in cream as that of some of the smaller breeds. But quantity and quality are seldom united, and the dairymen who make butter or cheese prefer cows of different breeds, which give rich milk, but do not get fat so readily.

The horses bred in this county are of a superior description, both for draught and for the saddle. The Cleveland bays are preferred for their vigour and activity. For farming work and drawing loads of coal or lime few horses surpass them. A good horse will draw in a cart nearly a ton of coals from the distance of thirty, and even thirty-five miles, over hilly and rough roads; going and returning in the twenty-four hours, without any considerable rest, and often without being out of harness the whole time: he will do this three times in the week, and do light jobs the other days. Horses can take longer journeys in hilly countries than in flat, without being distressed, as is well known. Hunters of superior power are produced by crossing strong active mares with blood horses which have great bone as well as spirit; or better, by having a breed produced by selected half-bred stallions and mares. A good hunter is a more valuable horse for the breeder than a race-horse, which may prove a prize hereafter, but seldom remunerates the breeder for his risk and trouble.

The young stock are kept in rich and extensive pastures, where they have plenty of food and good water. The dry pastures on the limestone rock are peculiarly adapted to rear horses, the sound soil being very advantageous to the proper hardness of the hoof.

There was once a very large breed of sheep in the south-eastern part of the county, which bore heavy fleeces, and

when killed often weighed from 50 lbs. to 60 lbs. the quarter. But the improved Leicester breed has nearly superseded them, as being more profitable, and fattening at an earlier age. There is a small and hardy species of sheep on the heaths and moors, which is similar to those found in other counties on the same description of land. They cost little to maintain, and produce little, but when fattened at four or five years old, the flesh is rich and delicate.

There are some very large fairs held in the county: the following are the chief:—

Durham fair, on the 21st of March; a great fair for horses, which continues a week; one of the principal horse-fairs in the north. On the Saturday before the 12th of May, cattle and horses, and hiring servants; Whitsun-eve, cattle, horses, sheep; 15th of September, horses and cattle; Darlington, first Monday in March, a great fair for cattle, horses, sheep; Whitsun Monday, ditto; Monday fortnight after Whit Sunday, cattle, sheep; Barnard Castle, Easter Monday, Whitsun Monday, Maudlin-day (2nd of August), cattle, horses; Bishop Auckland, Thursday before Ascension day; Corpus Christi day, Thursday before 10th of October; South Shields, 24th of June, 1st of September, holiday fair; Sunderland, May 13th, October 11th, ditto; Hartlepool, May 14th, November 27th; Stockton, July 18th, Monday after October 13th; Wolsingham, May 18th, September 21st.

There are weekly markets at Durham, Wolsingham, South Shields, Barnard Castle, Stockton, Bishop Auckland, Sunderland, and Staindrop.

Divisions, Towns, &c.—The county of Durham is a county palatine, *i. e.*, a county within which some lord had a jurisdiction 'as fully as the king had in his palace;' but a late Act of Parliament having transferred the palatinate jurisdiction from the bishop of Durham, by whom it was long held, to the crown, the distinction has been for most practical purposes abolished. Like the other three northern counties, Durham is divided, not into hundreds, but into wards: of these wards there are four, as follows:—

I. Chester ward, which occupies the northern part of the county: it is bounded on the north by the Tyne and Derwent rivers, on the east by the sea, on the south-east and south by the Wear, the Derness Beck, and a line drawn from the junction of the Hedley and Derness Becks to Shorngate Cross, on Cross Ridge. Above a fourth of the land in this ward is heath. II. Darlington ward, which extends from the boundary of Chester ward to the boundary of the county on the west and south: it is bounded on the east by an irregular line drawn from the junction of the Croxdale Beck with the Wear, to the junction of the Skerne and the Tees: a large proportion (four-ninths) of the land in this ward is heath. III. Easington ward, which is bounded on the north by Chester ward, on the west by Darlington ward, on the east by the sea, and on the south by a line drawn from Croxdale Beck eastward to the sea. IV. Stockton ward, which occupies the remaining portion of the county. Islandshire, Norhamshire, and Bedlingtonshire, which are usually termed 'the north bishopric,' are included in Chester ward: Craike is included in Stockton ward. Chester and Darlington wards are further subdivided into three divisions each, beside the outlying portions of the county which the former comprehends; Easington and Stockton into two divisions each. The area and population of these divisions are given in the population returns for 1831 as follows:—

| | | Statute acres. | Inhabit- ants. |
|---------------------------------------|----------------------------|-------------------|-------------------|
| Chester ward. | Islandshire . . . | 26,820 | 8,183 |
| | „ Norhamshire . . . | 18,810 | 3,744 |
| | „ The remaining part . . . | 158,060 | 88,878 |
| | | 203,690 | 100,805 |
| Darlington ward | | 282,480 | 55,904 |
| Easington ward. | Durham city . . . | 10,260 | 10,135 |
| „ | Sunderland town . . . | 120 | 17,060 |
| „ | The remaining part . . . | 77,120 | 47,321 |
| | | 87,500 | 74,516 |
| Stockton ward, including Craike . . . | | 105,860 | 22,685 |
| Total of the county | | 679,530 | 253,910 |

The county includes one city, Durham on the Wear seven borough towns, *viz.*—Auckland (Bishop), on the Wear in Darlington ward, pop. 2859: Barnard Castle, on the Tees, in Darlington ward, pop. 4430: Darlington on the Skerne, in Darlington ward, pop. 9417: Gateshead on the Tyne, in Chester ward, pop. 15177: Hartlepool on the Sea, in Stockton ward, pop. 1330: Stockton on the Tees, in Stockton ward, pop. 7763: and Sunderland, at the mouth of the Wear, in Easington ward. To these we may add the new parliamentary borough of South Shields on the Tyne, in Chester ward, pop. 18,756. Some of these are described elsewhere. [AUCKLAND, BARNARD CASTLE, DURHAM (CITY), GATESHEAD, SHIELDS (SOUTH), STOCKTON, and SUNDERLAND.] Of the remainder, as well as of the four market-towns of Sedgfield, Staindrop, Stanhope, and Wolsingham, an account is here subjoined.

Darlington is in a rich fertile country on the banks of the Skerne, 241 miles from London, and about 18 from Durham. The parish contains 7630 acres: it had, in 1831, 1347 inhabited houses and a population of 9417. The parish is subdivided into four townships, of which that of Darlington with Oxenhall, or Oxneyfield (3470 acres, 1192 inhabited houses and 8574 inhabitants) contains the town. Darlington is situated on the eastern slope of a hill, at the foot of which the river flows, and consists of a square market-place, of which the church forms the eastern side, and several streets, or as they are designated 'gates,' branching from it. A bridge of three arches over the Skerne, near the church, communicates with the Yarm and Stockton roads. The church, dedicated to St. Cuthbert, is a cross church with a central tower, surmounted by a light spire. It is very antient, except the east end of the chancel and the spire, which are modern: the interior also is so blocked up with modern screens and galleries that the shape of the church is very imperfectly seen. The general character of the architecture is early English, some portions so early as to appear almost of Norman character: the west end, where is the principal entrance, and the ends of the north and south transepts are fine compositions; the doors are plain but good. In the chancel are three stone stalls of a date considerably later than the walls of the chancel. The church was formerly collegiate; the principal clergyman was called dean. The college was dissolved in 1550, and the whole of the revenues vested in the crown, except a small stipend reserved for the officiating minister: the church lands, subject to some crown rents, are now vested in the duke of Cleveland, who is patron of the benefice, a perpetual curacy worth 274*l.* per annum. A former manor-house of the bishop of Durham is yet standing: after having been much neglected during the last century it was purchased of the see and converted into a parish work-house. The old toll-booth was removed and the present town-hall erected a few years ago. (*Surtees's Hist. of Durham*. London, 1823.) There are places of worship for Catholics, Methodists, and Protestant Dissenters.

The trade of Darlington is considerable: for a long period the principal manufactures were of camblots and other woollens: fifty years ago moreens and other like stuffs were made: the woollen manufacture was superseded in a great degree by that of linens, as huckabacks, diapers, sheetings, and checks; but this branch of industry has also experienced a declension, and the chief occupation of the inhabitants now is combing wool and making woollen yarn (which is applicable for imitation India shawls, Brussels carpets, &c.), spinning flax, grinding optical glasses, and founding iron. The market is on Monday for corn and provisions of all kinds; there is a great market for cattle every fortnight. The population of the town has increased considerably within the present century: in 1801 there were only 4670 inhabitants. The Darlington and Stockton railway has been already noticed. Darlington is a municipal borough by prescription: its privileges are at least as old as the 12th century: it is governed by a bailiff, who is appointed by the bishop: the limits of the borough comprehend only a part of the town.

The township of Darlington had, in 1833, one infant-school with 50 or 60 children; a well-endowed grammar-school, founded by Queen Elizabeth, containing 53 boys and 12 girls; a Lancasterian school of 148 boys with a lending library attached; two national schools with 266 boys and 240 girls, and a lending library attached; three day-schools, partly or wholly supported by charitable contributions, with 100 girls and 7 boys; eighteen other day-schools with 257 boys and 317 girls; five boarding and day-schools with 40

to 190 children of both sexes; a boarding-school for the sons of Catholic parents, with 43 scholars; and three Sunday-schools, one supported by Independents, with 70 boys and 50 girls, and two supported by Wesleyan Methodists for 282 boys and 306 girls. There are two sets of almshouses.

Between Darlington and the Tees are four round pools, popularly called 'Hell-kettles,' the three largest, which are near together, are nearly 120 feet in diameter and in depth 19, 17 and 14 feet respectively: the fourth, which is some way from the others, is only 28 feet in diameter and 5 or 6 deep. In all of them the water stands to the brim, and is quite cold, but impregnated with sulphur, curdling with milk, and refusing to mix with soap. Leland mentions these pits, and says that it was conjectured that there was a subterraneous communication between them and the Tees; but as they are not affected by the floods or other variations of that river, the conjecture is now discredited.

Hartlepool is built on a small peninsula jutting out into the sea, a few miles from the Tees' mouth: the peninsula is partly formed by a pool, dry at low water, into which flows a small beck; this pool is called the Slake. In forming drains in it, human bones, trees, the wood of which was very perfect, stags' antlers, and teeth supposed to be deers' teeth, have been found. Hartlepool is in Stockton ward, 253 miles from London through Stockton. The parish comprehends an area of 840 acres, and had, in 1831, 275 inhabited houses and a population of 1330. The peninsula forms one of the most marked features of the eastern coast; the town, now much decayed, is on its south-western side near the entrance of the Slake. There appears to have been a monastery early founded here, of which St. Hilda was abbess: it is mentioned by Bede. It took its name from the island which Bede calls *heoptu* or *heoptes*, Hart's Water or Pool. Henry of Huntingdon calls it *Insula Cervi*, 'Hart's Isle.' This monastery was destroyed in the invasion of the Northmen, or Danes. The Normans, when they came into possession of the place, called it *Hart-le-pol*, the pool or slake of Hart, whence the modern designation. It appears to have been early a harbour of some consequence, for in 1171 Hugh, earl of Bar, son or nephew to Hugh Pudsey, then bishop of Durham, brought his fleet with an armament of Flemings (forty knights with their retinues and five hundred foot soldiers), intended to assist William of Scotland in his invasion of England, into the bay of St. Hilda.

In the thirteenth century, the territory of Hartlepool seems to have been in the family of De Brus of Annandale, the Bruces of Scottish history. King John, by charter A.D. 1200, erected it into a borough, and granted to Robert de Brus a weekly market and a yearly fair. In the course of the thirteenth century the walls were erected, and a small haven of nearly twelve acres formed. The walls inclosed and defended the town and haven on every side, except where the abrupt cliffs on the eastern side of the peninsula rendered defence needless: fifty years ago, these walls exhibited an almost perfect and interesting specimen of the defences of former times: a considerable part of them still remains. The old haven is now quite disused: the present harbour is formed by a pier run out on the south side of the town: it is the only safe harbour between Sunderland and Bridlington, easily accessible in every wind to light vessels or to laden vessels under 100 tons, which ride secure from the storms most frequent and destructive on the eastern coast, and in moderate weather can sail out with all winds. The town rises from the edge of the old haven towards the town moor, which occupies a considerable part of the peninsula, and on which the burgesses have right of common. It consists of one principal and several smaller streets. Its general appearance, when the corporation commissioners visited it, was mean, and little trade was carried on; but they state in their report, 'Wet docks are now forming under the provisions of a local act, and railways are proposed to be made from the coal-fields in the neighbourhood of the town. The formation of docks will probably make this port a considerable one. The estimate of the cost of the works commenced is 220,000*l*. Within the last ten months 120 new houses have been built, and others are constantly being erected. Ground for building sells at from 10*s*. to 1*l*. per square yard.' From the demand for building-land the town moor is estimated to be worth 20,000*l*. There is a town-hall, a mean building, erected about the middle of the last century. The market is on Saturday. The inhabitants are chiefly engaged in fishing: many tons of fish are

salted for exportation. Hartlepool is a place of some resort for sea-bathing.

The church, dedicated to St. Hilda, is on an elevated site at the south-east end of the town. It is a large and curious building, chiefly in the early English style: the south door has some late Norman enrichments. The chancel has been shortened, and various modern alterations made. The tower on the west end is tolerably lofty, with an embattled parapet and crocketed pinnacles: it is supported by very large and bold flying buttresses. The benefice is a perpetual curacy, in the gift of the vicar of Hart (Hart is the mother church of Hartlepool), of the yearly value of 143*l*. There was formerly a monastery of Franciscan or Grey friars. What is now called the Friary is an old house built after the dissolution by those to whom the site was granted; but some traces of older masonry are visible in the fragments of walls which surround the friary. There are meeting-houses for Wesleyan Methodists and Ranters. The corporation is governed by a charter granted by Elizabeth. It is not enumerated in the schedules of the Municipal Reform Act.

There were, in 1833, two endowed day schools and three unendowed, containing in all about 230 children; and three Sunday-schools, with 380 or 390 children. One Sunday-school has a lending library attached.

The shore of the peninsula is marked by rocks or cliffs which do not exceed 40 feet in height, and by several caverns or excavations. One cavern may be explored for nearly 50 yards: there is a tradition that it communicated with the church. There are the remains of a breast-work on the town moor and of some batteries along the shore. There are two chalybeate springs near the town.

When De Brus declared his pretensions to the Scottish crown, his English possessions were forfeited, and the borough of Hartlepool was granted to the Clifford family, by which it was long held. It was plundered by the Scots in 1312, and again taken by them in 1315, a year after the battle of Bannockburn: on the latter occasion the inhabitants saved part of their property on board some vessels then in the harbour. Hartlepool furnished five ships and 145 seamen to the fleet of Edward III. before Calais. In the northern rebellion under the earls of Northumberland and Westmoreland, in the time of Elizabeth, Hartlepool was taken by the rebels. The Scottish army, which came to the aid of the parliamentarians in the civil war of Charles I., took Hartlepool in 1644: it was retained by them till 1647, when they evacuated it, and it was occupied by a garrison of parliamentarians. Mr. Romaine, a well-known theological writer, was born at Hartlepool.

Sedgefield is in Stockton ward, on the road from Stockton to Durham, 251 miles from London, 9 from Durham, and 9 from Stockton. The parish contains 17,480 acres: it is divided into seven townships. The township of Sedgefield, which comprehends the town with the hamlets of Layton, Sands, and Hardwick, has an area of 6220 acres: it had, in 1831, 309 inhabited houses, and a population of 1429; of which about half was agricultural. The population of the whole parish was 2178. Sedgefield is a small neat town, with the appearance rather of a handsome village, and stands on an eminence commanding an extensive prospect over the vale of Tees and the Yorkshire hills beyond. The church, dedicated to St. Edmund, is one of the handsomest in this part of the county: the date and style of the architecture are different in different parts: there are some curious early English piers with enriched capitals, and some Decorated windows. The tower is in the Perpendicular style, turreted, and with four pinnacles. The chancel is divided from the nave by a rich screen of old oak with three stalls on each side: the chancel is wainscoted with old oak, and stilled with seven seats on each side. The font is a handsome octagon of black marble. The churchyard is spacious and shaded with trees. The living is a rectory worth 1802*l*. per annum, with a glebe house, on the lawn in front of which are some fine evergreen oaks. The bishop of Durham is patron of the living. There is a range of almshouses near the church, founded in 1702 by Mr. Thomas Cooper, for five poor men and as many poor women. The market is on Friday. There were in the township of Sedgefield, in 1833, one boarding and day-school, and seven day-schools, one endowed, containing in all about 270 children; and two Sunday-schools, with 150 children. The rest of the parish contained two day-schools (one endowed), with 36 children.

Staindrop is in Darlington ward, 247½ miles from London, about 7 miles to the right of the Glasgow and Carlisle mail-road, and about 19 miles from Durham. The parish contains 14,990 acres, and had, in 1831, 2395 inhabitants (besides some few who were included in the return from another parish); it comprehends six townships and part of a seventh. The township of Staindrop contains 1810 acres, and had in 1831 a population of 1478. Staindrop is an antient town situated in a beautiful vale, and was originally a royal demesne. Many of the houses are well built and chiefly form one wide street ranging east and west. Staindrop Beck runs at the east end of the town. The church, dedicated to St. Mary, is near the Beck; it is an antient fabric, consisting of a nave, side aisles, and chancel, with an embattled tower at the west end. The tower opens to the nave and south aisle; it is very plain. The church has some portions of early English character: the chancel has some good stone stalls and a fine monument in the Decorated English style: there is also in the church a rich monument of later date, to the memory of Ralph Nevill, earl of Westmoreland, and his wives. The church was formerly collegiate: the dwelling-place of the collegiate clergy and other beneficiaries was on the north side of the church. The revenues of the college were, at the dissolution, 170*l.* 4*s.* 6*d.* a year gross revenue, or 126*l.* 5*s.* 10*d.* clear. The market, which has been revived after long discontinuance, is on Saturday, for provisions: there is very little or no corn sold. The living is a vicarage united to the neighbouring rectory of Cockfield; their joint yearly value is 354*l.* with a glebe house; they are in the gift of the duke of Cleveland. There are congregations of Methodists and Independents at Staindrop. There were in the township of Staindrop in 1833 two infant or dame schools, with 40 children; seven day, or boarding and day-schools, with about 180 children, and three Sunday-schools with 230 children. The rest of the parish contained two day-schools (one partly supported by the duke of Bedford), containing nearly 60 children. Close to Staindrop is Raby Castle, the seat of the duke of Cleveland. The castle is on the east side of the park, which is very extensive. The principal part of the building was erected by John Nevill, earl of Westmoreland, in the fourteenth century; one part is even more antient. Many alterations have been made in the castle by subsequent possessors, but they have not materially affected its outward form, the general effect of which, from its extent, grandeur, and preservation, is very imposing. Its situation is fine: it occupies a rising ground, with a rocky foundation, and is inclosed with an embattled wall and parapet. In this outer wall there is only one entrance, a gateway defended by two square towers. Several of the smaller apartments have been hollowed out in the walls, which are of great solidity and strength. This castle was the residence of the powerful family of the Nevills, earls of Westmoreland; but on the rebellion raised by the last of that family against Elizabeth his estates were forfeited. They afterwards came by purchase to Sir Harry Vane, from whom they have descended to the present owner. Many parts of the pleasure-grounds command extensive and beautiful views.

Stanhope is in Darlington ward, 262 miles from London, by a road which enters the county at Pierce Bridge, and runs through West Auckland and Wolsingham to Stanhope, and on to Aldstone Moor, in Cumberland. The parish, which comprehends 55,030 acres, is one of the largest in England: it had in 1831 a population of 9541. It is divided into four townships, of which Stanhope quarter township, in which is the town, comprehends an area of 13,010 acres, and had in 1831 233 inhabited houses and a population of 2080, chiefly engaged in the lead mines. The town is on the northern bank of the Wear. The church, dedicated to St. Thomas, is on a rising ground on the north side of the town; it is a plain and antient building. On the west side of the town is an eminence called the Castle Hill, rising to the height of 108 feet perpendicular from the bank of the Wear. The summit is of an oblong figure, thirty paces wide, divided by a ditch into two irregular parts; another ditch defends the acclivity on the north and east; the summit is supposed, from foundations discovered many years since, to have been once surrounded by a wall of ashler work strongly cemented. The tradition is that it was a fortress of remote origin demolished in an incursion of the Scots. At a short distance from the town on the west is a spacious old building called Stanhope Hall,

once the manor-house of the Featherstonehaugh family. The market is on Friday: there were two annual fairs, but they are disused. The living is a rectory in the gift of the bishop of Durham, of the yearly value of 4848*l.*, with a glebe-house. There were in the whole parish in 1833 one endowed day-school, with nearly 40 children; one national school, partly endowed, with 60 children; two day-schools, partly supported by endowment and subscriptions, with 136 children; and two other day-schools unendowed, with 115 children; five day and Sunday-schools, with nearly 500 children; and four Sunday-schools with 282 children. Several of the schools had lending libraries attached. Near the town on the north side is a remarkable cavern, said to be a mile long, and to abound with stalactites.

Wolsingham is in Darlington ward, 256½ miles from London on the road to Stanhope and Aldstone Moor. The parish comprehends an area of 24,780 acres, and had in 1831 439 inhabited houses, and a population of 2239. The town is pleasantly situated on a point of land formed by the confluence of the Wear and the Wescrow, on the north side of the former river. The church, dedicated to St. Mary and St. Stephen, is on the north side of the town, but has nothing remarkable about it: near it are the remains of a considerable building, supposed by some to have been part of a monastery founded by Henry de Pudsey; by others to have been an antient manor-house of the bishops of Durham. The market is on Tuesday, for butcher's meat, butter, potatoes, and corn. The quantity of corn sold is not great, but the prices are commonly as high as any in the county. It is chiefly for the supply of the lead-mine district, which commences between this town and Stanhope. The district is easily recognized by the large parcels of lead lying near the sides of the road, and by the blue unwholesome vapours which proceed from the smelting-houses. The views down the Wear from the hill above Wolsingham are very extensive and much diversified. The living of Wolsingham is a rectory in the gift of the bishop of Durham, of the yearly value of 791*l.*, with a glebe-house.

There were in Wolsingham parish in 1833 one school, partly supported by endowment, with 52 children; another, partly supported by charitable contributions, with 28 children; a third supported by a private benefaction, with 48 children; these were all day-schools, and there were six other day-schools, with 144 children; there were also three Sunday-schools, with 130 children. There is a Baptist congregation in the parish. Wolsingham parish is divided into seven 'quarters,' or hamlets.

Beside the above market-towns, Hutchinson (*History of Durham*, 4to., Carlisle, 1794, vol. iii. p. 285) speaks of a market being held at the chapelry of St. John, in Wear-dale. The chapel of St. John is on the south side of the Wear, about seven miles from Stanhope, on the road to Aldstone Moor: it is a handsome building, rebuilt several years ago by Sir Walter Blacket. The benefice, which is a perpetual curacy, worth 186*l.* a year, is in the gift of the rector of Stanhope, or rather the inhabitants nominate and the rector approves. The market, which is on Saturday, was established for the benefit of the miners, of whom, when Hutchinson wrote, 800 were employed in the neighbourhood, and the number has probably increased since. The valley of the Wear is here deep and narrow; there is a stone bridge of one arch over the river.

Beside the market-towns, there are in the county several villages of sufficient importance, historical or commercial, to require notice.

Chester-le-Street is on the high north road between Durham and Newcastle-upon-Tyne, six miles from Durham, and eight and a half from Newcastle. The parish comprehends an area of 31,260 acres: it is mostly in Chester ward, to which it gives name, but extends into Easington ward: its population in 1831 was 15,478. It is divided into several chapelries or townships, of which the principal, with their areas and population in 1831, are as follows:—Chester-le-Street (chapelry), 2940 acres, 1910 inhabitants; Tanfield (chapelry), including Beamish and Lintz Green (townships), 6760 acres, 2498 inhab.; Birtley (township), 1480 acres, 1520 inhab.; Harraton (township), 2090 acres, 2171 inhab.; Lamesley (chapelry), 3390 acres, 1910 inhab.; and Great Lumley (township), 1730 acres, 2301 inhab.; the last, with the two smaller townships of Lambton and Little Lumley, is in Easington ward; the others in Chester ward.

The name of Chester-le-Street gives this place a two-fold claim to be considered a Roman station; yet neither the

name nor the exact site of the station (which some would remove as much as a mile from Chester) has been determined. The Saxons called Chester, from the name of the brook, Cone, which flows past it, Coneceastre, or Cuneceastre: it became A.D. 882 the seat of the bishopric, which was removed hither from Lindisfarne, and it retained its episcopal rank until 995, when a Danish invasion drove away the bishop and his clergy, who afterwards settled at Durham. The church, after losing its rank as a cathedral, became first rectorial, afterwards collegiate: the manor has been constantly vested in the see of Durham. The revenue of the college at the dissolution was 77*l.* 12*s.* 8*d.* The present village extends nearly a mile along the north road; another more irregular line of houses runs along the brook at right angles to the main street. The church consists of a nave with side aisles, a chancel, and a tower at the western end, surmounted with a lofty spire rising to the height of 156 feet from the ground. The lower part of the tower is of Early English, with a Perpendicular west door and window of later insertion, and with massy buttresses: the upper part of the tower, which is of later date, is octagonal; it has an embattled parapet and four pinnacles; the spire is also octagonal. The interior of the church and many of the windows have been modernized: there are some remains of painted glass: the north aisle contains the monuments of the Lumley family: there are fourteen altar tombs with as many stone effigies, mural tablets, &c. The living is a perpetual curacy, worth 377*l.* per annum. The deanery-house, so called as being built in place of the former residence of the dean of the collegiate church, is a handsome brick house; there are no vestiges of the antient buildings.

Lumley Castle, in the township of Great Lumley, is on a fine gradual elevation above the Wear. It is a quadrangle of yellow freestone, with an open court or area in the centre, with four uniform towers. It is an antient building, and the east front retains its former magnificence: a noble gate-house projects from the centre, with overhanging turrets: this front overhangs a ravine through which the Lumley Beck flows; on the west and south the ground slopes gradually down to the Wear. The castle was probably built in the latter part of the fourteenth century. The pictures are chiefly portraits of the antient family of the Lumleys. The village of Great Lumley is a mile and a half from Lumley Castle. It contains an almshouse or hospital for twelve poor women, founded in 1686 by John Duck, alderman of Durham.

Lambton Hall, the seat of the earl of Durham, was built in 1797 on the site of the old house of Harraton, the former seat of the Hedworths: the grounds are pleasant, but the building displays many incongruities. Ravensworth Castle, the seat of Lord Ravensworth, is a modern building: its style is varied, being a selection from the castle architecture of different periods, not too remote however to be brought into contact. The park includes a heronry. In a private road near the castle there is a cross with a plain shaft and pedestal.

Lamesley and Tanfield chapels are modern buildings. Besides the noblemen's seats already mentioned, the parish contains the residences of several of the gentry.

There were in the whole parish in 1833 seven day-schools with 243 children, wholly or in considerable part supported by endowments or other charitable contributions; forty-seven other day-schools with 1325 children; and fourteen Sunday-schools with 1220 children. Three of the endowed schools are Sunday-schools also, and are attended by more children on Sunday than in the week. Two schools have lending libraries attached. There are several congregations of Wesleyan Methodists in the parish.

Jarrow, or Yarrow, is between Newcastle and South Shields: the church is 8 miles from Newcastle, and 2½ from Shields; but when the tide is out a mile may be saved between Jarrow and Shields by crossing 'the Slake,' a recess in the south bank of the Tyne, dry at low water. The parochial chapelry of Jarrow is tolerably extensive, comprehending 8640 acres, and having in 1831 a population of 27,995. It is in Chester ward. It is divided into five chapelries or townships; two of which, the townships of South Shields and Westoe, constitute the parliamentary borough of South Shields. Of the remaining three divisions, Harton township contained in 1831 1000 acres and 217 inhabitants; Jarrow, with Monkton chapelry, 3690 acres and 3598 inhabitants; and Heworth chapelry 2190 acres and 5424 inhabitants. The parish of Jarrow antiently extended across

the Tyne, and comprehended a portion of Northumberland; but all connection with this part has long ceased.

Jarrow was very early the seat of a monastic establishment of the Benedictine order. An inscription stone states that the original church was founded A.D. 685. The monastery was established A.D. 681, by Benedict, a noble Saxon, who had previously founded the monastery of Monk Wearmouth, and the fabric was completed four years afterwards. Jarrow derives its chief interest from its connection with the Venerable Bede [BÆDA], whose birth is fixed by an antient and probable tradition at the hamlet of Monkton, which nearly adjoins Jarrow. In A.D. 870 the monastery was burned by the piratical Northmen, or Danes, but rising from its ruins, was again destroyed in the ravage of the country north of the Tyne by William the Conqueror, A.D. 1070. It again revived, but in A.D. 1083 William, bishop of Durham, removed the monks to Durham, and reduced Jarrow to the condition of a cell to the Benedictine monastery of St. Cuthbert there. Its yearly revenues at the dissolution were valued at 40*l.* 7*s.* 8*d.* gross, 38*l.* 14*s.* 4*d.* clear. The site of the monastery is near the western side of 'the Slake,' not far from the bank of a small beck which flows into the Tyne. Many ruins of the monastery still remain, but they are so scattered and confused that it is difficult to form a conjecture as to the original appearance and the arrangements of the convent, or even to distinguish them from the remains of a lay mansion that was erected upon its ruins. The church adjoins the centre of the monastic buildings immediately on the north. The tower rises from the centre of the church, between the nave and the chancel. The church was rebuilt, with the exception of the tower and part of the church, in 1783. The tower retains some curious Norman features. It has round-headed double lights on every side. A rude oaken seat, which appears to have been hewn out with an axe, is exhibited in the vestry as Bede's chair: the boards which form the back are modern; the rest is doubtless very antient. Roman inscriptions and pavements have been dug up near Jarrow, and it is conjectured, from the appearance of some of the stones, that the church and monastery were partly constructed of the fragments of a Roman building. There are large coal works at Jarrow: a row of houses for the colliers extends nearly a mile to the west of the church. The living is a perpetual curacy of the annual value of 197*l.* The chapelry of Monkton and Jarrow contained in 1833 nine day-schools, with 289 children; and five Sunday-schools, with 505 children.

Heworth is a chapelry in the parochial chapelry of Jarrow: it contains an area of 2190 acres; and had, in 1831, a population of 5424: it is divided into Upper and Nether or Low Heworth. The chapel at Low Heworth is a modern building, but probably occupies the site of one not less antient than the church at Jarrow. Some very antient coins of the Saxon kingdom of Northumberland were some years since dug up in the chapel-yard. One corner of this chapel-yard contains a monument, a neat plain obelisk, nine feet high, fixed on a stone base, to the memory of ninety-one persons killed in the explosion of Felling colliery, 1812. There is a parish school-house, built by subscription in 1815; this school contained in 1833 131 children. There were at the same time eleven other day-schools, with 351 children, and five Sunday-schools, with 556 children. At Heworth Shore on the Tyne are many factories of Prussian blue and other colours, one for coal tar, and an establishment for preparing alkali for soap boilers; also ship-building yards, a pottery, a glass-house, a lead refinery, wharfs for grindstones, a brown paper mill, an establishment for preparing fish oil from the blubber brought by the Greenland ships, &c. Freestone of an open porous character, called from its excellence in enduring a strong heat, firestone, is quarried at High Heworth.

Winlaton is a manufacturing village between the Tyne and the Derwent. The township of Winlaton in the parish of Ryton in Chester ward comprehends an area 4540 acres, and had in 1831 a population of 3951 persons. Sir Ambrose Crowley, an alderman of London, established here about 1690 the extensive iron works which still bear his name. Sir Ambrose seems to have been peculiarly anxious for the well-being of his workmen, establishing regulations for their guidance, appointing a court of arbitrators to settle disputes, establishing schools, providing medical attendance for the sick, and advancing money to them, pensioning the superannuated, and providing for the families of the dead. All his charities, however, ceased

in 1816. A chapel was built at Winlaton in 1705, as it is said, on the foundation of one destroyed in the rebellion of the northern earls against Elizabeth. The chapel was abandoned by the company carrying on the iron works, and having gone to decay was pulled down in 1816, and a national school-room built in its place, in which the rector of Ryton or his curate voluntarily performs service. There were in 1833 two national schools with 190 children, seven other day-schools with 239 children, and two Sunday-schools with 100 children.

Middleton in Teasdale is in Darlington ward: it lies on the north bank of the Tees, on the road from London to Haltwhistle. The whole parish comprehends an area of 38,410 acres, of which the township of Middleton includes 9750 acres. The village is situated among hills, and extends in somewhat an oval form round a spacious green. Almost every house is used for the sale of liquors or of some kind of goods. The inhabitants (who, in 1831, were 1824 for the township, or 3714 for the whole parish) are chiefly engaged in the numerous lead mines near. The church is small, but antient: the living, a rectory in the gift of the crown, is said to be worth 1500*l.* per annum: it does not appear to have been included in the return laid before parliament of the revenue of the church. Some of our authorities assign to this place a weekly market held on Thursday: it is probably a customary market. The township contained, in 1831, one endowed day-school, with 50 children; two unendowed day-schools, with 45 children; one day and Sunday-school, with 150 day or 180 Sunday scholars, supported by the Lead Company, who oblige their work-people to send their children either to this school or to some other. There is a considerable library attached to this last school, containing a variety of useful works, which are lent gratuitously to those of the scholars or of the workmen who desire to have them.

Houghton-le-Spring is in Easington ward, on the road from Durham towards Sunderland, 7 miles from Durham. The whole parish, which is divided into 18 townships or chapelries, contained, by the returns of 1831, 14,560 acres, and 20,524 inhabitants; of which 1220 acres and 3917 inhabitants were in the township of Houghton-le-Spring; 1590 acres and 5887 inhabitants in that of Hetton-le-Hole; 1310 acres and 2539 inhabitants in the chapelry of Painshaw; and 1460 acres and 2198 inhabitants in the township of Newbottle.

The village of Houghton is irregular and nearly half a mile long, at the head of a fine vale, sheltered on the north and east by limestone hills. It contains several handsome buildings. Houghton Hall is a heavy mansion, built probably in the reign of Elizabeth or James I., in the later Gothic style. The church is large, in the form of a cross, with a square tower, springing from four arches at the intersection of the transepts and nave. Some portions of the church are in the Early English, and some in the Decorated style: the east and west windows have fine Decorated tracery. The church contains the monument of Bernard Gilpin, some time rector of Houghton, 'the Apostle of the North,' and one of the most pious of the English church reformers: it is an altar tomb with pannelled sides, and a good specimen of the mixture of Gothic and Italian forms. The living is a rectory, in the gift of the bishop of Durham, of the yearly value of 2157*l.*, with a glebe-house. On the north-east side of the churchyard, on a rising ground, is the grammar school founded by the exertions of Bernard Gilpin with the aid of some friends; and in the churchyard to the south of the school-house an almshouse for six poor people. Houghton had, in 1833, one boarding-school with 45 boys; nine day-schools, one a charity school with 38 girls; another a national school with 300 boys; the seven other day-schools had nearly 200 children; and three Sunday-schools with 656 children. The grammar school is not distinguished in the Parliamentary Returns from other schools.

Hetton-le-Hole is a mile or two south of Houghton-le-Spring. The increase of the population between 1821 and 1831, when it rose from under 1000 to nearly 6000, was owing to the extension of the collieries, which in 1831 gave employment to nearly 1800 men and boys, of whom above 1000 were upwards of twenty years old. There were at Hetton, in 1833, one day and Sunday-school with 68 day scholars and nearly 330 Sunday scholars; fourteen other day-schools with nearly 700 children, and two Sunday-schools with above 300 children.

Painshaw or Painschaw lies at some distance north o

Houghton, on the banks of the Wear, at the western foot of a conical hill, Painshaw Hill: it is almost entirely occupied by persons connected with the collieries and stone quarries, the opening of which latter occasioned a considerable increase of population from 1821 to 1831. There is a chapel of ease, a plain convenient building, the minister of which is appointed by the rector of Houghton.

Newbottle is between Houghton and Painshaw. It is on a high exposed situation. A little to the north below the brow of the hill is Philadelphia Row, a group of houses entirely occupied by the colliers of the neighbouring pits. There is a considerable pottery at Newbottle. The population rather decreased from 1821 to 1831, from the decline of the collieries in the township.

Monk Wearmouth and Bishop Wearmouth are included in the parliamentary borough of Sunderland; and the parochial chapelry of Tweedmouth in Islandshire, which comprehends an area of 4520 acres, and had in 1831 a population of 4971 persons, may be considered as a suburb or Berwick-upon-Tweed in the parliamentary limits of which it is included. [BERWICK-UPON-TWEED, SUNDERLAND.]

Divisions for Civil and Ecclesiastical purposes. The county of Durham is in the diocese of Durham and in the ecclesiastical province of York. It constitutes an archdeaconry, which is subdivided into the deaneries of Chester-le-Street, Darlington, Easington, and Stockton. Of the outlying portions of the county, Islandshire, Northumberland, and Bedlingtonshire are in the archdeaconry of Northumberland, except the parochial chapelry of Ancroft in Islandshire, which is in the archdeaconry of Durham. Craike is in the peculiar jurisdiction of the bishop of Durham. The number of parishes, as we gather from the population returns compared with the 'Clerical Guide,' is 60; of which 33 are rectories, 21 vicarages, and 6 perpetual curacies. The richer benefices are among the wealthiest in any part of England. Besides the 60 parishes, there are 15 parochial chapelries; and by the subdivision of these or the parishes, 24 district chapelries have been formed.

Some of the parishes and parochial chapelries are of great extent. Stanhope parish comprehends 55,030 acres or 86 square miles: Auckland, St. Andrew 45,470 acres or 71 square miles; Lanchester 41,890 acres or 65 square miles; Middleton in Teasdale 38,410 acres or 60 square miles; Chester-le-Street 31,260 acres or 49 square miles; Wolsingham 24,780 acres or 39 square miles; Gainsford 24,370 acres or 38 square miles; Brancepeth 21,850 acres or 34 square miles; besides eleven others, ranging from 10,000 to 20,000 acres, or from 15½ to 31 square miles, and several which approach 10,000 acres.

Durham is included in the northern circuit. The assizes and the quarter-sessions are held at Durham, where stands the county gaol and the house of correction.

Before the Reform Act there were four members returned to parliament from this county, two for the county itself and two for the city of Durham. By the Reform and Boundary Acts the county was formed into two divisions, each returning two members. The northern division includes Chester and Easington wards; the principal place of election is Durham, and the polling stations are Durham, Sunderland, Lanchester, Wickham (or Whickham), Chester-le-Street, and South Shields. The southern division comprehends Darlington and Stockton wards; the principal place of election is Darlington, and the polling stations are Darlington, Stockton, Bishop Auckland, Stanhope, Middleton in Teasdale, Barnard Castle, and Sedgefield. By the Reform Act two members were given to Sunderland, including part of the parishes of Monk Wearmouth and Bishop Wearmouth; and one member each to Gateshead (including part of the chapelry of Heworth in the parochial chapelry of Jarrow) and South Shields, including the townships of South Shields and Westoe in the parochial chapelry of Jarrow.

History and Antiquities. At the time of the Roman invasion the main part of the county of Durham was included in the territory of the Brigantes (*Brigantes* Ptolemy), a powerful tribe who occupied the northern part of the island from the Mersey to the Tyne; the outlying portions, Islandshire, Northumberland, and Bedlingtonshire, were included in the territory of the Ottadini (*Ottadini* Ptolemy), whose country extended from the Tyne to the Forth. The Brigantes were subdued by Cerealis and Agricola, and the Ottadini by Agricola; but no incidents have been recorded of their subjugation which are peculiarly connected with this county.

The main part of the county remained in the possession of the Romans until they finally withdrew from the island, being defended by the wall of Hadrian or Severus, which extended from sea to sea across Northumberland and Cumberland; the outlying portions being beyond the wall, were occupied by the Romans or not, as circumstances, or the character of the emperor, or the commander in the island, dictated. The notices of the district by the ancient geographers are scanty. We gather from the Itinerary of Richard of Cirencester that the Tees was known to the Romans as the Tisa, the Tyne as the Tina, and the Tweed (which borders Northumberland) as the Tueda; and from Ptolemy, that the Wear (Horsley will have the Tyne) was known as the Vedra. The Romans had several stations within the county. Vindomora and Vinovium, mentioned in the first Itinerary of Antoninus are fixed by antiquarians at Ebbchester on the Derwent, and Binstchester, near Bishop Auckland.

In Jeffreys' large map of Durham the Epicum of Richard (which is placed by most at Lanchester) is fixed at Ebbchester, with which both the name and the distance from Vinovium in Richard's Itinerary seem best to agree: in the same map the Longovicum of the Notitia is fixed at Lanchester, where Horsley proposes to place the Glanoventa of Antoninus. Ad Tisam, mentioned by Richard, is fixed at Pierce Bridge on the Tees. Gateshead was considered by Camden to be the Gabrosentum of the Notitia, which others place at Drumburgh near Carlisle; and Brememum had been fixed at Monk Wearmouth; but this position is not to be reconciled with Ptolemy's mention of it. Perhaps there are few parts of the island of which the Roman topography is more obscure. Roman antiquities have been found at Chester-le-Street (coins), from whence Roman roads may be traced leading northward towards Newcastle-upon-Tyne, and southward to Binstchester near Auckland; at Coniscliffe or Conscliffe, near Pierce Bridge (an altar); Old Durham, near Durham city (coins); at Lanchester (inscriptions, coins, and other antiquities); at Pierce Bridge (coins, the traces of an aqueduct, foundations of houses, and other marks of a station); at South Shields (an inscription indicating that a Roman town or station was fixed here in the time of Marcus Aurelius); at Stanhope (an altar); at Thornton, near Darlington (an urn with coins, chiefly of Constantine and his sons); at Monk Wearmouth (coins); at Whitburn Lizard (coins). Reynolds' *Iter Britanniarum*, Cambridge, 1799.

In the establishment of the Saxon Octarchy, Durham was probably included in the kingdom of Deira, the southernmost of the two which are frequently comprehended under the general name of Northumberland. When Oswald, who united the two kingdoms under one sceptre, wished to introduce or rather revive Christianity, Aidan, a monk of Iona or elsewhere in Scotland, who had come as a missionary (A.D. 634), fixed his residence at Lindisfarne, or Holy Island, and established a monastery and a bishopric there. The seat of the Northumbrian bishopric was afterwards (A.D. 664) removed to York; but when, in 678, Northumberland was divided into two dioceses, Lindisfarne recovered its episcopal rank; and its diocese was permanently severed from that of York. Shortly after this time the see of Hexham was created, the diocese being severed from that of Lindisfarne. As the ravages of the Danes, towards the close of the ninth century, rendered Lindisfarne an insecure abode, the bishop and clergy forsook it (about A.D. 875), and, after they had wandered about for seven years, the seat of the bishopric was fixed at Chester-le-Street, where the foundations of a cathedral were begun. In the reign of Ethelred II. the ravages of the Danes were renewed, and the bishop and clergy leaving Chester-le-Street (A.D. 995), as deeming it insecure, removed first to Ripon, in Yorkshire, and afterwards to Dunhelm, now Durham, where the see has been fixed ever since. Lindisfarne, deserted by the bishop, was afterwards bestowed upon the Benedictine monastery of Durham, to which it became a cell. Its yearly revenues at the dissolution were valued at 60*l.* 5*s.* gross, or 48*l.* 18*s.* 11*d.* clear. The ruins of the conventual church still remain: the north and south walls, and great part of the west wall, are still standing: the east wall has fallen in. It has been a very magnificent building, in the Norman style. The length of the body of the church is one hundred and thirty-eight feet, the breadth eighteen, and with the two aisles thirty-six; but it may be doubted whether there ever was a transept. The stones

appear red with fire, and on the south side of the chancel are honeycombed by the weather.

Upon the invasion of England by William the Conqueror, Egelwin, bishop of Durham, took the oath of allegiance at York to William, who had advanced into the north to crush the threatened resistance of the earls Morcar and Edwin. Robert Comyn, a Norman noble, to whom William had committed the charge of the entire subjugation of the north, having entered the city of Durham with his troops (seven hundred men), in 1069 or 1070, was overpowered by the population of the surrounding country, and cut off with all his men: the cathedral narrowly escaped destruction in this tumult. William, enraged at the disaster, advanced in person with his army, and laid waste the country with the most savage ferocity.

For sixty miles between York and Durham he did not leave a house standing, reducing the whole district by fire and sword to a horrible desert, smoking with blood and in ashes. He did not spare even the churches and monasteries. The ecclesiastics fled from Durham at his approach, and retired to Lindisfarne. A dreadful famine ensued, and a mortality not equalled in the annals of the country; the inhabitants were reduced to eat the flesh of horses, dogs, and cats, and at last even human carcases. The lands lay untilled for nine years, infested by robbers and beasts of prey; and the poor remnant of the inhabitants spared from the sword died in the fields, overwhelmed with want and misery. The treasures of the church, except those which the bishop carried away in his flight, were plundered either by the Normans or by Gospatric, who had purchased of William the earldom of Northumberland. The ravages of the conquerors were carried forward from the Wear to the Tyne, and the monastery of Jarrow was burned. Soon after William withdrew, the Scots, under their king Malcolm, invaded the north of England, routed the men of Teasdale, who opposed them near Eglestone, and burned Wearmouth monastery and Hartlepool. Egelwin, bishop of Durham, was one of those who endeavoured to organize in the Isle of Ely an opposition to William; but being taken prisoner, was cast into prison, where he died from famine or a broken heart. He was succeeded in the see A.D. 1072 by Walcher, a native of Lorraine, who seems to have been the first bishop that possessed the palatine jurisdiction so long exercised by his successors. Walcher, or those who acted under him, having provoked the indignation of the people by their oppressive conduct, the bishop was surrounded by a tumultuous assembly at Gateshead, and taking refuge in the church, the building was fired, and the bishop attempting to escape, was put to death in 1080. The insurgents got possession of the city of Durham; but having in vain attempted to make themselves masters of the castle, were obliged to disperse in order to avoid punishment. To revenge this popular outbreak, the country was again laid waste by an army under Odo, bishop of Bayeux, half-brother of William. The next but one in succession to Walcher was Ralph Flambard, in whose episcopate the diocese suffered diminution by the erection of the see of Carlisle; and the diocese of Hexham, which on the failure of its own bishops had been annexed to Durham, was taken from that diocese and annexed to York. For some years following 1140 the diocese was thrown into disorder by the usurpation of the see by one Cummin, a priest, a native of Scotland, who attempted to hold it in opposition to the regularly-appointed bishop. After a desultory warfare Cummin submitted.

In the year 1312 the Scots invaded the county of Durham, burned the suburbs of Durham, and plundered Hartlepool. They again invaded the county after the battle of Bannockburn, and for a third and fourth time in 1316 and 1317. Famine and pestilence followed the ravages of war, and the country became more desolate than at any time since the great Norman devastation. Marauders infested the country; and Lewis Beaumont, bishop elect (A.D. 1317 or 1318), was carried off by a party as he was proceeding to Durham to be installed.

In the beginning of the reign of Edward III. the Scots invaded the country, and took possession of the mountainous tract of Weardale; but the approach of the king with an army prevented them from penetrating into the more level districts of the eastern coast. In the year 1342 there is reason to think that they again invaded the country; and in 1346, under the conduct of their king David, they crossed the Tyne and the Derwent, and encamped about

three miles from the city of Durham. Edward was in France; but the northern nobles and prelates collected a powerful army, and the battle of Nevill's Cross terminated in the defeat of the Scots and the captivity of David.

Durham does not appear to have been the scene of any remarkable event in the war of the Roses. The Yorkists, under the Marquis of Montacute, marched across it to attack the Lancastrians before the battle of Hexham. In the invasion of England by James IV. of Scotland, who favoured the cause of Perkin Warbeck, Norham Castle was besieged by the king; but when reduced to the last extremity, was relieved by the approach of the earl of Surrey with an army.

At the time of the Reformation the see of Durham was held by Cuthbert Tunstall, a man honourably distinguished in that persecuting age by his mildness and forbearance. He was imprisoned and deprived of his bishopric under Edward VI., the ample endowments of the see forming probably a greater inducement to his persecutor (Dudley, earl of Northumberland) than his steady adherence to the Catholic discipline. He was restored under Mary, but finally deprived after the accession of Elizabeth. The inhabitants of the northern counties were much attached to the ancient church, and afforded full exercise to the laborious zeal of Bernard Gilpin and other Reformers. The religious establishments were not however richly endowed, with the exception of the priory at Durham. Kypen and Sherburn hospitals, which were among the wealthiest, had each considerably less than 200*l.* a year gross revenue. In the rebellion of the earls of Northumberland and Westmoreland in support of the Catholic faith, they found little difficulty in raising a tumultuous force, with which they entered Durham, tore and trampled under foot the English Bibles and prayer-books, and celebrated mass in the cathedral; and while a detachment occupied Hartlepool, the main body marched southward into Yorkshire. On the advance of the royal army under the earl of Sussex the insurgents retreated to Raby, and after losing some time in besieging Barnard Castle, which they starved into a surrender, they were obliged to disperse, the two earls escaping into Scotland. Northumberland was afterwards delivered up to the English and beheaded; Westmoreland escaped over sea, and entered into the service of the king of Spain. In the latter part of Elizabeth's reign the northern counties were much afflicted by a pestilence which broke out every year in some part or other. In 1597 the city of Durham suffered very severely.

In 1633 Charles I. visited the county, and was entertained by the bishop at his castle of Durham: again in

1639, on occasion of his progress northward to oppose the Scots, he received similar hospitality. When the Scots invaded England, in 1640, they crossed the Tyne into this county, Lord Conway, who commanded the king's troops, retreating first to Durham and afterwards to North allerton, in Yorkshire. By a convention which followed, the county was for some time heavily taxed for the payment of the Scottish army. When the civil war broke out in 1642, the earl of Newcastle formed the four northern counties into an association for the king's service. This county was not the scene of any remarkable incident in that war. The Scotch army entered England in 1644, in order to support the Parliamentarians. They were opposed by the Royalists; but though several skirmishes were fought in the country, no serious encounter took place, and the marquis of Newcastle being obliged to march into Yorkshire to sustain the royal cause there, Durham came into the hands of the Parliamentarians.

During the Commonwealth the see was dissolved; but upon the restoration of Charles II. it was re-established, and bestowed on Bishop Cosins, who distinguished himself by the munificent use he made of his large revenues. The local history of the county since the Restoration is not marked by any interesting features.

STATISTICS.

Population.—Durham is one of the principal counties in which coal is raised: it does not rank very high as an agricultural county, being the thirty-ninth on the list in that respect. Of 59,045 males twenty years of age and upwards living in Durham in 1831, there were 11,329 engaged in agricultural pursuits, 2,547 in manufactures or in making manufacturing machinery, and 19,473 labourers employed in labour not agricultural. Of those engaged in manufactures, 550 were employed in stuff and carpet-making at Barnard Castle and in the city of Durham; about 500 were employed in the making of glass, especially glass bottles, at Gateshead, South Shields, Bishop's Wearmouth, Heworth, and Southwick; 350 in weaving linen and flax-dressing at Stockton and other places; 150 in iron works at Bedlington and at Bishop's Auckland; 150 in making engines, moulds, and patterns, chiefly at Birtley and Sunderland; 70 in woollen manufacture at Shildon and Walsingham; the remainder were employed in the manufacture of earthenware, sailcloth, &c., at various places.

The following exhibits a summary of the population, taken at the last census, 1831, showing the number of the inhabitants and their occupations in each ward of the county:—

| WARDS, &c. | HOUSES. | | | | OCCUPATIONS. | | | PERSONS. | | | Males twenty years of age. |
|--------------------------------------|------------|-----------|-----------|--------------|---|---|--|----------|----------|---------|----------------------------|
| | Inhabited. | Families. | Building. | Uninhabited. | Families chiefly employed in agriculture. | Families chiefly employed in trade, manufactures, and handicraft. | All other families not comprised in the two preceding classes. | Males. | Females. | Total. | |
| Chester Ward, three divisions . . . | 14,186 | 19,884 | 129 | 621 | 1,963 | 6,414 | 11,507 | 42,284 | 46,594 | 88,878 | 19,779 |
| Darlington Ward, three divisions . . | 9,203 | 11,189 | 50 | 350 | 2,759 | 4,057 | 4,373 | 27,978 | 27,926 | 55,904 | 14,077 |
| Easington Ward, two divisions . . . | 8,011 | 9,894 | 130 | 285 | 1,214 | 3,393 | 5,287 | 23,279 | 24,042 | 47,321 | 11,265 |
| Stockton Ward, two divisions . . . | 4,402 | 4,841 | 13 | 127 | 1,559 | 1,579 | 1,703 | 10,856 | 11,829 | 22,685 | 5,716 |
| Islandshire . . . | 1,209 | 1,451 | 4 | 69 | 347 | 356 | 748 | 3,814 | 4,369 | 8,183 | 1,711 |
| Norhamshire . . . | 697 | 728 | 10 | 39 | 355 | 150 | 223 | 1,811 | 1,933 | 3,744 | 885 |
| Durham (city) . . | 1,288 | 2,271 | 5 | 30 | 203 | 1,180 | 888 | 4,547 | 5,588 | 10,135 | 2,375 |
| Sunderland (town) . | 1,744 | 4,478 | 4 | 49 | 8 | 1,382 | 3,088 | 7,179 | 9,881 | 17,060 | 3,237 |
| Totals . . . | 40,740 | 54,736 | 345 | 1,570 | 8,408 | 18,511 | 27,817 | 121,748 | 132,162 | 253,910 | 59,045 |

The population of Durham, at each of the four enumerations, was—

| | Males. | Females. | Total. | Inc. per cent. |
|------|---------|----------|---------|----------------|
| 1801 | 74,770 | 85,591 | 160,361 | |
| 1811 | 83,671 | 93,954 | 177,625 | 10.76 |
| 1821 | 99,100 | 108,573 | 207,673 | 16.91 |
| 1831 | 121,748 | 132,162 | 253,910 | 22.22 |

Showing an increase between the first and last periods of

93,539 persons, or 58½ per cent., which is 2½ per cent. beyond the general rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the four dates of—

| | | | |
|------|----------|-----------------------------------|----------------------|
| 1801 | £51,966 | which was 6 <i>s.</i> 5 <i>d.</i> | for each inhabitant. |
| 1811 | " 81,752 | " " 9 <i>s.</i> 2 <i>d.</i> | |
| 1821 | " 91,182 | " " 8 <i>s.</i> 9 <i>d.</i> | |
| 1831 | " 81,862 | " " 6 <i>s.</i> 5 <i>d.</i> | |

The sum expended for the same purpose in the year ending the 25th March, 1836, was 65,392*l.*; and if it be assumed that the population has increased at the same rate of increase since 1831 as in the ten preceding years, the above sum gives an average of not quite 4*s.* 8*d.* for each inhabitant. All these averages are below those for the whole of England and Wales.

The sum raised in Durham for poor's-rates, county-rate, and other local purposes, in the year ending 25th March, 1833, was 104,707*l.* 15*s.*, and was levied upon the various descriptions of property as follows:—

| | |
|---|------------|
| On land | £64,467 10 |
| „ dwelling-houses | 22,950 5 |
| „ mills, factories, &c. | 7,508 10 |
| „ manorial profits, navigation, &c. | 9,781 10 |

The amount expended was—

| | |
|--|-----------|
| For the relief of the poor | 81,213 7 |
| In suits of law, removal of paupers, &c. | 4,350 1 |
| For other purposes | 18,601 16 |

£104,165 4

In the returns made up for the subsequent years the descriptions of property assessed for local purposes are not distinguished: the sums raised in the years ending 25th March, 1834, 1835, and 1836, were 107,648*l.* 4*s.*, 96,491*l.* 1*s.*, and 87,972*l.* 1*s.* respectively. The expenditure was as follows:—

| | 1834. | 1835. | 1836. |
|---|------------|----------|-----------|
| For the relief of the poor | 79,398 16 | 78,197 2 | 65,391 10 |
| In suits of law, removals, &c. | 5,945 3 | 4,321 4 | 3,736 0 |
| Payment towards the county-rate | 20,391 18 | 9,107 16 | 7,614 10 |
| For all other purposes | | 9,167 3 | 8,845 0 |
| Total money expended | 105,035 17 | 94,693 5 | 85,086 0 |

The saving effected in the whole sum expended in 1836, as compared with the expenditure of 1834, is therefore 19,949*l.* 17*s.*, or nearly 19 per cent.; and the saving in the cost for the relief of the poor is 14,007*l.* 6*s.*, or rather more than 17½ per cent.

The county expenditure in 1834, exclusive of that for the relief for the poor, was 8,938*l.* 2*s.* 5*d.*, disbursed as follows:—

| | £. | s. | d. |
|--|-------|----|----|
| Bridges, buildings, and repairs, &c. | 1,646 | 4 | 6 |
| Gaols, houses of correction, &c., and maintaining prisoners, &c. | 2,979 | 8 | 4 |
| Lunatic asylums | 157 | 13 | 11 |
| Prosecutions | 2,029 | 6 | 8 |
| Clerk of the peace | 506 | 5 | 6 |
| Conveyance of prisoners before trial | 683 | 1 | 3 |
| „ of transports | 52 | 12 | 0 |
| Constables—high and special | 5 | 6 | 6 |
| Coroner | 143 | 12 | 0 |
| Miscellaneous | 453 | 2 | 8½ |

The number of persons charged with criminal offences in the three septennial periods ending with 1820, 1827, and 1834, were 452, 688, and 1010 respectively; making an average of 64 annually in the first period, of 98 in the second, and of 144 in the third. The number of persons tried at quarter-sessions in each of the years 1831, 1832, and 1833, in respect to which any costs were paid out of the county-rates, were 63, 73, and 91. Among the persons charged with offences, there were committed for—

| | 1831. | 1832. | 1833. |
|------------------------|-------|-------|-------|
| Felonies | 50 | 50 | 78 |
| Misdemeanors | 13 | 23 | 13 |

The total number of commitals in each of the same years was 124, 198, and 168, respectively; of whom

| | 1831. | 1832. | 1833. |
|--------------------------------------|-------|-------|-------|
| The number convicted was | 91 | 119 | 92 |
| „ acquitted | 6 | 57 | 27 |
| Discharged by proclamation | 27 | 22 | 49 |

The number of persons charged with offences in 1836 was 164; of these 105 were convicted and 59 acquitted, or no bill found against them. Of the 105 convicted, 6 were sentenced to death, which sentence was commuted to transportation; besides these there were 16 transported; 7 were imprisoned for 1 year, and above 6 months; and 75 for 6 months and under; and 1 was fined. Of the offences com-

mitted, 28 were against the person, 11 of which were for common assaults; 12 were offences against property committed with violence; 107 offences against property committed without violence; 7 for malicious offences against property; and 10 for riot or misdemeanor. Of the offenders 134 were males and 30 females. Among the whole number only 3 had received superior instruction, 83 could read and write imperfectly, 64 could neither read nor write, and the degree of instruction of the remaining 14 could not be ascertained. The proportion of offenders to the population in 1836 was 1 in 1720.

The number of turnpike trusts in Durham, as ascertained in 1834, was 19; the number of miles of road under their charge was 249; the annual income arising from the tolls and parish composition was 38,199*l.* 11*s.* 10*d.*, and the annual expenditure 36,614*l.* 2*s.* 11*d.*

The number of persons qualified to vote for county members in Durham (in 1836) were 5208 in the northern division, and 4864 in the southern division, being 1 in 28 of the whole population, and 2 in 13 of the male population above 20 years of age. The expenses of the last election of county members to parliament were to the inhabitants of the county 259*l.* 9*s.* 4*d.*, and were paid out of the general county-rate.

There are 8 savings'-banks in this county. The number of depositors, and amount of deposits on the 20th November, were respectively in—

| | 1832. | 1833. | 1834. | 1835. |
|--------------------------------|----------|---------|---------|---------|
| Number of depositors | 3,356 | 3,584 | 3,691 | 4,013 |
| Amount of deposits | £109,352 | 114,436 | 115,678 | 122,109 |

The various sums placed in the savings'-banks in 1834 and 1835 were distributed as follows:—

| | 1834. | 1835. |
|-----------------------------|----------|----------|
| Not exceeding £20 | 1,844 | 1,965 |
| „ 50 | 1,163 | 1,324 |
| „ 100 | 457 | 492 |
| „ 150 | 135 | 147 |
| „ 200 | 71 | 68 |
| Above 200 | 21 | 17 |
| Total | 3,691 | 4,013 |
| | £115,678 | £122,109 |

Education.—The following summary is taken from the parliamentary inquiry on education made in 1835:—

| | Schools. | Scholars. | Total. |
|---|----------|-----------|--------|
| Infant Schools | 18 | | |
| Number of infants at such schools; ages from 2 to 7 years:— | | | |
| Males | | 222 | |
| Females | | 264 | |
| Sex not specified | | 330 | |
| | | | 816 |

| | | | |
|---|-----|--------|--------|
| Daily Schools | 769 | | |
| Number of children at such schools; ages from 4 to 14 years:— | | | |
| Males | | 16,142 | |
| Females | | 11,370 | |
| Sex not specified | | 3,328 | |
| | | | 29,849 |
| Schools | 787 | | |
| Total of children under daily instruction | | | 30,656 |

| | | | |
|--|-----|--------|--------|
| Sunday Schools | 260 | | |
| Number of children at such schools, ages from 4 to 15 and 16 years:— | | | |
| Males | | 11,095 | |
| Females | | 9,862 | |
| Sex not specified | | 3,486 | |
| | | | 24,443 |

Assuming that there was the same rate of increase from 1831 in the population of the county as in the ten preceding years, and that the portion of it between the ages of two and 15 bore the same ratio to the whole as it did in 1821, there were living in Durham about 90,245 persons between those ages in 1834. Only two Sunday-schools are returned from places where no other schools exist: with this trifling exception, Sunday-school children have opportunity of resorting to daily schools also; but in what number or in what proportion duplicate entry is thus produced must remain

uncertain. Forty-seven schools, containing 4145 children, which are both daily and Sunday-schools, are returned from various places, and duplicate entry is therefore known to have been thus far created. Making allowances for these imperfect data, we may conclude that, perhaps, not half of the children between the ages of 2 and 15 were receiving the benefit of instruction at the time the inquiry was made.

Maintenance of Schools.

| Description of Schools. | By endowment. | | By subscription. | | By payments from scholars. | | Subscrip. and payment from scholars. | |
|-------------------------|---------------|-----------|------------------|-----------|----------------------------|-----------|--------------------------------------|-----------|
| | Schls. | Scholars. | Schls. | Scholars. | Schls. | Scholars. | Schls. | Scholars. |
| Infant Schools | 77 | 3151 | 3 | 214 | 10 | 233 | 5 | 370 |
| Daily Schools | 77 | 3151 | 25 | 1,649 | 630 | 20,482 | 47 | 4556 |
| Sunday Schools | 10 | 356 | 225 | 21,259 | 3 | 104 | 23 | 2195 |
| Total... | 87 | 4007 | 253 | 23,121 | 633 | 20,818 | 75 | 7123 |

The schools established by Dissenters, included in the above statement, are—

| | Schools. | Scholars. |
|--------------------------|----------|-----------|
| Infant schools | 1 | 40 |
| Daily " | 11 | 510 |
| Sunday " | 83 | 10,312 |

The schools established since 1818 are—

| | | |
|--------------------------------|-----|--------|
| Infant and other daily schools | 365 | 14,841 |
| Sunday-schools | 184 | 17,208 |

Twenty-six boarding-schools are included in the number of daily schools as given above. No school in this county appears to be exclusively confined to any particular denomination of Christians, such exclusion being disclaimed in almost every instance, especially in schools established by Dissenters, with whom are here included Wesleyan Methodists, together with schools for children of Roman Catholic parents.

Lending libraries of books are attached to 52 schools in this county.

DURHAM, a city and borough, the capital of the county palatine of Durham, 67 miles east-south-east from Carlisle, 67 west-north-west from York, and 259 north-by-west from London.

We have no evidence of any town having existed where Durham now stands before the end of the tenth century, when the monks of Lindisfarne, or Holy Island, rested there with the remains of St. Cuthbert. According to the legend, when they arrived at Dunholme, the car, in which the saint's body was carried, by some miraculous interposition, became immovable, and the monks proceeded to build a sort of tabernacle wherein they deposited the relics; but soon after a stone church was built by Bishop Aldun, and dedicated to St. Cuthbert, whose remains were removed, and enshrined in it. The town of Dunholme, or Durham, was besieged by Duncan of Scotland in 1040; but was so well fortified and defended, that, after several fruitless assaults on the part of the assailants, the besieged made a successful sally and completely routed the enemy. By Leland it is called Duresme (the Norman name, whence Durham). 'The towne self of Duresme,' says Leland, 'standith on a rocky hille; and stondith as men cum from the south cuntre on the ripe of Were, the which water so with his course naturall in a botom windeth about, that from Elvet, a great stone bridge of 14 arches, it crepeth about the towne to Trainegate bridge of 3 arches, also on Were, that betwixt these two bridges, or a little lower at St. Nicholas, the towne, except the length of an arrowshot, is brought in insulam.'

In 1069, Robert Cumin was appointed governor by William the Conqueror; but, in consequence of the excesses committed by the Norman soldiers under his command, the inhabitants set fire to his house, and murdered the whole garrison, with the exception of one man who escaped. William, greedy of revenge, marched an army northward, and the terrified inhabitants fled from the city; the monks retired to Holy Island; but when tranquillity was restored, they again returned to Durham with their sacred relics, which they had carried with them. In 1072 a strong castle was built here, and Walcher, a Norman, was appointed to the bishoprick. This prelate purchased the earldom of Northumberland, and assumed the title of Count Palatine. In 1093 the old church built by Aldun was pulled down, and the present magnificent edifice begun by King Malcolm, Carilepho the bishop, and Turgot the prior. Durham was often the head-quarters of Edward III., and of other monarchs and commanders on their excursions

against Scotland. After the battle of Newburn, the city of Durham became almost depopulated.

By the 6th and 7th Will. IV., chap. 19, the whole of the palatine jurisdiction of the bishops of Durham is taken away, and is vested in the crown as a separate franchise and royalty. Before the passing of that act, the bishop of Durham, as count palatine and earl of Sadberg, was *custos rotulorum* of the county; he presided at the assizes, with his Majesty's judges, and the sheriff was accountable to him, and not to the king.

The city sends two members to parliament. The first charter was granted by Hugh Percy, and was confirmed by Pope Alexander; the governing charter is that of Bishop Egerton, dated 1780. The limits of the parliamentary borough have been extended by the Reform and Boundary Acts, and now include part of the township of Crossgate, part of the parish of St. Giles, part of the township of Elnet, the whole of St. Mary-le-Bow, and the whole of St. Mary-the-Less. There are now three wards, six aldermen, and eighteen councillors. The revenue of the corporation is small, but they have no debt.

The corporation hold a court-leet and a court-baron as lessees of the bishop, for the recovery of debts under 40s. The court of the county of Durham (not the ordinary county court) was abolished by the 6th and 7th Will. IV., c. 19. The assizes for the county are held here twice a-year by the judges going the northern circuit.

The city is nearly surrounded by the river Wear, and, as Leland remarks, forms a peninsula, the centre of which rises to a lofty eminence, partially enclosed by the ancient walls, and skirted with hanging gardens descending to the river, on each side of which are delightful public walks called The Banks. The cathedral and castle crown the summit. [CHURCH.]

At the northern extremity of the city is Framwell-gate bridge, erected about the year 1120 by Bishop Flambard. Elvet bridge, which crosses the river opposite Framwell-gate bridge, was originally built by Bishop Pudsey, in 1170, but it has lately been considerably widened and improved. A handsome bridge, consisting of three arches, was erected in the end of the last century at the extremity of the South Bailey.

The castle, which forms the occasional residence of the bishops of Durham, is supposed to have been built by William the Conqueror. The north gateway was till lately, when a new gaol, county courts, and house of correction were erected at an expense of nearly 120,000*l.*, used as a county gaol. In the market-place is the guildhall, erected by Bishop Tunstall in 1555; and on the Palace Green is the exchequer, containing offices for the auditor, cursor, prothonotary, treasurer, registrar, &c.

The town is lighted with gas, and well paved. A public fountain stands in the centre of the market-place; the water is conveyed to the reservoir through pipes from a spring granted to the city for ever in 1450, by Thomas Bellingham, Esq. There is a theatre, as well as a subscription library, news-room, and assembly-rooms. Races are held here in May. The population of Durham in 1831 was 9269. There were 806 voters registered in 1832, the first registration after the Reform Act.

The trade of Durham was formerly much more considerable than it is at present. There are manufactories of stuffs and carpets, for spinning and combing wool, and for making hats, a brass-foundry, and two iron-foundries. A market for corn and other provisions is held on Saturday. There are fairs for cattle and horses on the 29th, 30th, and 31st of March, on Whit Tuesday, on the Saturday before the 13th of May, on September 15th, and on the Saturday before the 23rd of November. The March fair is very celebrated for its horses.

The city comprises six parishes: St. Giles, St. Margaret, St. Mary-le-Bow, St. Mary (in South Bailey), St. Nicholas, and St. Oswald, the livings of which are respectively of the clear annual value of 99*l.*, 409*l.*, 111*l.*, 119*l.*, 87*l.*, 272*l.* There are places of worship for Quakers, Independents, Primitive and Wesleyan Methodists, and Roman Catholics. A mechanics' institute was established in 1825. There is a grammar-school connected with the cathedral which has four exhibitions for the sons of clergymen, of 25*l.* each at the school, and of 50*l.* each at either of the universities; it has also five scholarships of 10*l.* per annum each at Peter House, Cambridge, founded by Bishop Cosins, and one scholarship of 16*l.* per annum at Emanuel College, Cam-

bridge, jointly with the school at Newcastle-upon-Tyne. There are about 60 boys educated at the school, exclusive of 18 on the foundation. There is a blue-coat and Sunday school, as well as infant schools and a charity-school in Gravel-lane. It is said that upwards of 1000 children are gratuitously educated in Durham and its suburbs. An infirmary, erected in 1791, is supported by voluntary contributions. On Palace Green are almshouses for four poor men and four poor women, who receive an annuity of 70*l*. In addition to the charitable institutions mentioned, there is a numerous list of benefactors to the poor of the city and its vicinity.

About three-quarters of a mile from Durham is the site of the Maiden Castle, a fortress ascribed to the Romans, as also some remains of the Ikniel-street. Saline, chalybeate, and sulphureous springs are found in the neighbourhood.

DURHAM CATHEDRAL. A plan of the cathedral of Durham has been already given under CHURCH, with its general dimensions of length, breadth, and height. It was begun during the reign of William Rufus by Bishop William de Carlepho, and continued, if not quite finished, by his successor Ranulf Flambard, who had shown his talent for architecture, before his promotion to the see of Durham, by the erection of the collegiate church of Christ Church, in Hampshire.

The cathedral erected by these prelates was of the form universally adopted by the Norman architects: a long cross, with two turrets at the west end, and between them a large and richly-ornamented arched door of entrance. The eastern end probably terminated in a semicircular form, as the lines of union of the original work with the Chapel of the Nine Altars strongly indicate. The side aisles, both of the nave and choir, were vaulted with semicircular arches groined; but the nave and choir were open to the timber roof. Such was the form of the edifice as left by the first architects.

The first addition to the original church was the Galilee, or Western Chapel, built by Bishop Hugh de Pudsey, between 1153 and 1195. The nave was vaulted by Prior Thomas Melsonby, who acceded in 1233, to whom also some ascribe the projecting of the great or central tower and the beginning of the building of the Chapel of the Nine Altars. These great works were finished by Richard Hotoun, who became prior in 1290, and who is recorded to have vaulted the choir. The great west window was inserted by prior John Fosour about the year 1350. The altar-screen, erected chiefly at the expense of John Lord Neville, was finished in 1380 by prior Robert Berington.

The successive additions to this cathedral have rendered the church, as it now stands, not only a perfect specimen of the Norman architecture, but a most instructive series of examples, illustrating the gradual changes of the English style to the beginning of the fifteenth century. (Hutchinson's and Surtees's *Histories of Durham*, with the *Account of the Cathedral* written for the Society of Antiquaries by Sir H. C. Englefield, fol. Lond. 1801.)

DURHAM UNIVERSITY. The first attempt to establish a university at Durham was made during the time of the Commonwealth and the Protectorate of Cromwell. It originated in 1649, after the passing of the act for the abolition of deans and chapters, but was not carried into effect till May 15th, 1657, when letters patent were granted, by which the houses late belonging to the dean and prebendaries were converted into a university to be called by the name of 'The Mentor, or Provost, Fellows, and Scholars of the College of Durham, of the foundation of Oliver, Lord Protector of the Commonwealth of England, Scotland, and Ireland,' &c. By the same letters patent rent-charges to the annual amount of 900*l*. were assigned for the support of the persons belonging to the foundation, and leave was given them to purchase and enjoy lands and revenues to the amount of 6000*l*. a year. They were also to take the manuscripts, library books, mathematical instruments, &c. late belonging to the dean and chapter. The college however was never completely settled: at the Restoration the dean and chapter resumed their lands, and this foundation totally disappeared. (Pennant's *Tour in Scotland and the Hebrides*, 1772, vol. ii., p. 336; Surtees's *Hist. of the County Palat. of Durham*, vol. i., p. 106.) Oxford and Cambridge petitioned Richard Cromwell when protector, against the power which his father had

given to the university of Durham to grant degrees *passu* with them.

The following is the history of the university more recently established in this city.

The dean and chapter of Durham, by an act of chapter bearing date the 28th of April, 1831, have established an academical institution in that city in connexion with their cathedral church, which by an act of parliament passed in the 2nd and 3rd years of William IV., entitled 'An Act to enable the Dean and Chapter of Durham to appropriate part of the property of their Church to the establishment of a University in connexion therewith, for the advancement of learning,' became confirmed and endowed. By this act the government of the university was vested in the said dean and chapter for the time being, subject to the jurisdiction of the bishop of Durham for the time being as visitor, and the establishment was to consist of a warden or principal, of certain professors and readers, tutors, students, and other officers and persons. By this act also certain lands, tenements, and hereditaments comprised in the leases mentioned in the schedule to the said act annexed, and the inheritance thereof in fee simple (subject to the said leases for years, and saving to the dean and chapter of Durham and their successors all mines, &c. opened and to be opened within and under the said lands), are vested in the dean and chapter of Durham and their successors for ever, in trust to apply the rents, fines, and other profits and proceeds of the said lands, for the maintenance and establishment of a university in connexion with the cathedral church of Durham. The leases mentioned in the schedule (the great majority of which are of dwelling-houses) amount to 394. The act empowers the dean and chapter, with the consent of the bishop of Durham, to sell all the lands and tenements mentioned in the said schedule, and also all other lands and tenements which shall at any time be vested in the dean and chapter of Durham in trust for the university. The purchasers of any of the lands and tenements so sold are to pay the purchase-money into the bank of England, in the name and with the privy of the accountant-general of the court of chancery, to be placed to his account there, '*ex parte* the Dean and Chapter of Durham, the University of Durham account.' The fifth section of the act provides for the application of the said purchase-mones. The fifteenth section enacts 'That it shall be lawful for any person or persons whatsoever, having any power to make an absolute disposition thereof, to give, convey, or assure, by any deed or deeds, any messuages, lands, tenements, or other hereditaments, or any estate or interest therein or thereout, or any monies, chattels, or effects, to the said Dean and Chapter of Durham and their successors, in trust for such University as aforesaid, or for any Professor, Reader, or other person or persons holding office therein or connected therewith; any law, statute, or custom to the contrary in anywise notwithstanding.' By another act of chapter, dated April 4th, 1834, it was directed that under the bishop as visitor, and the dean and chapter as governors, the affairs of this university should be managed by the warden and a senate and convocation: the senate to transact the ordinary business of the university and be competent to originate regulations and other measures relating to it, but such regulations and other measures not to be in force until confirmed by the convocation; the convocation to confirm or reject what is submitted to it by the senate, but to have no power to originate or amend.

This university is allowed to grant degrees in the several faculties, which are conferred by the warden and convocation, but the grace for a degree must be allowed by the dean and chapter before it is proposed in convocation. The academical year at Durham consists of three terms, of not less than eight weeks each, called respectively Michaelmas, Epiphany, and Easter terms; Michaelmas term not commencing earlier than the 10th October, and Easter term not ending later than 30th June. For the degree of B.A. the petitioner must be a student of the standing of twelve terms from his admission, and have kept nine terms at least by residence. For the degree of M.A., he must be of the standing of nine terms at least from the taking of his B.A. degree. A petitioner for the degree of B.D. must be of the standing of twenty-one terms from his admission as M.A. and a D.D. of thirty-three terms from the same. A petitioner for the degree of B.C.L. must be of the standing of twenty-one terms at least from the date of his

matriculation. and no grace for the degree of D.C.L. can be granted unless the petitioner is a B.C.L. of thirty-three terms' standing. No grace for M.D. is granted unless the petitioner is a Bachelor of Medicine of the standing of nine terms at least from the date of his admission to that degree. This university has also the power to grant Honorary Degrees. For the detail of the exercises requisite for proceeding to the different degrees the reader is referred to the *Statute enacted by the Dean and Chapter*, with the *Regulations passed under its authority by the Senate and Convocation of the University*, 8vo. Durham, 1836.

In addition to the existing college, and any other establishment which may hereafter be founded by statute, halls and houses may be opened for the reception of students by licence, and under regulations from the warden and senate.

During the present year (1837) a royal charter has been granted to the university of Durham, which was formally received by that body in the month of June, 1837, and at the same time various gentlemen were admitted to the degree of B.A. The terms of the charter are not yet (June, 1837) made public.

DURIO, a genus of which the name has been derived from *durion* or *doorean*, a well-known fruit of the Malayan Archipelago. The specific name of *zibethinus* has been applied to the tree which forms this genus, from the fondness of the Malayan Zibet (*Viverra Zibet*, Hors.) for this fruit.

The genus Durio belongs to the natural family of Bombacaceæ, considered by some botanists to be only a tribe of Sterculiaceæ. It is characterized by having its five petals smaller than the five lobes of the calyx. The stamens, long and numerous, are arranged in five bundles, and have twisted anthers; the free germen is surmounted by a long filiform style and capitate stigma; the fruit, roundish and muricated, is divided internally into five cells, and easily separates when ripe into five parts; each cell contains from two to four or five seeds enveloped in soft pulp.

Durio zibethinus is a large and lofty tree, with alternate leaves, which are small in proportion to its size; in form they resemble those of the cherry, or are oblong-pointed, small and green above, like nutmeg-tree leaves, but on the under surface are covered with orbicular reddish-coloured scales, as some species of Capparis; the petioles are tumid, and furnished with a pit towards their base; the flowers are arranged in clusters on the trunk and older branches, where of course is also borne the fruit, as in the Jack and Cocoa trees.

The Durion is a favourite food of the natives during the time (May and June) when it is in season; but there is usually also a second crop in November. It is as remarkable for the delicacy combined with richness of its flavour, as for the intolerable offensiveness of its odour, which is compared by Rumph to that of onions in a state of putrefaction, on which account it is seldom relished by strangers, though highly esteemed by many European residents. In size it is equal to a melon, or a man's head, and sometimes compared to a rolled-up hedge-hog (hence it has been called *echinus arboreus*) in consequence of its hard and thick rind, which is yellow-coloured when ripe, being covered with firm and angular projections. From this appearance has likewise been derived its Malayan name, *dury* in that language signifying a thorn or prickle. (Rumph.)

The seed, with its edible enveloping pulp, is about the size of a hen's egg; the latter is as white as milk, and as delicate in taste as the finest cream, and should be eaten fresh, as it soon becomes discoloured, and undergoes decomposition. Excessive indulgence in this, as in other fruits, is apt to create sickness, and therefore to its abundance has been sometimes ascribed the unhealthiness of some years; but as the crop of fruit is most abundant when the rains are very heavy and follow great heats, the sickness is probably due as much to the peculiarities of the season as to the too free use of this fruit.

The seeds of the Durion are likewise eaten when roasted, and have something of the flavour of chestnuts. The wood of the tree is valued for many economical purposes, especially when protected from moisture. The rind of the fruit is likewise turned to account by the industrious Chinese, as its ashes, when burnt, from probably containing potash, are used by them in the preparation of some dyes.

Marsden, in his account of Sumatra, quotes a celebrated writer as saying that 'Nature seems to have taken a pleasure in assembling in the Malay islands her most favourite

productions.' Among these may be enumerated the *Mangosteen*, the Jack and Bread-fruit trees, the *Lansoh* and *Durion*, with others which are common in other tropical parts. These it has not been possible to cultivate in the hot-houses of England, even with all the skill of its horticulturists; a circumstance which must be ascribed partly to the great size of the trees, and partly to the peculiarity in climate of 'India aquosa,' as this part of the world was called by old writers. But as it is only within a few years that moisture has been combined with heat in the present successful cultivation of Orchideous plants, it might perhaps be possible to make some of the above fruits grow in a similar artificial climate; and by grafting, to make them bear when only a few feet high, as has been done with the *Mango* in India.

DURLACH, a circle of the province of the Middle Rhine, in the northern part of the grand duchy of Baden. It contains one town, two market-villages, eight villages, four hamlets, and about 24,200 inhabitants, of whom about 18,500 are Protestants, 5200 Roman Catholics, and 500 Jews, &c.

DURLACH, the chief town, is situated on the Pfalz, at the foot of the Thurmberg, a richly-cultivated hill, about four miles south-east of Carlsruhe, the road to which is formed by a straight avenue of Lombardy poplars: in 48° 59' N. lat., and 8° 25' E. long. It is an old town, and was long the residence of the margraves of Baden-Durlach, one of whom, Charles William, built Carlsruhe, and removed the seat of government to that spot. The palace, called the Carlsburg, and its grounds, in the latter of which are four stone columns once set up on the road through the land of the Decumates, in the reigns of Caracalla, Heliogabalus, and Alexander Severus, as well as an altar to Hercules, and several stone tablets with Roman inscriptions upon them, are the chief attraction of the place. It has a church, a seminary for teachers, and a town-hall, eight main streets, about 510 houses, and a population of about 4600. Trade, agriculture, and horticulture, the manufacture of wine, and mechanical pursuits, form the chief occupations of the people. The environs are covered with orchards. There is a large manufactory of earthenware in the town; and it has one of the most extensive markets for grain in the grand duchy. The celebrated German mechanic, Von Reichenbach, was born here.

DURSLEY. [GLOUCESTERSHIRE.]

DUSSEK, JOHANN LUDWIG, a celebrated composer for and performer on the piano-forte, was born in Bohemia, in 1760. His education in the university of Prague was most liberal, and music forming a part of it, he adopted that art as a profession. Dussek came to London about the year 1790, immediately distinguished himself, and might have realized an ample fortune had his industry and discretion borne any proportion to his talents. In 1800 he quitted England, and two years after became part of the household, and also the intimate and confidential friend, of Prince Louis Ferdinand of Prussia, who died so bravely at Saalfeld in 1806. He then entered into the service of Prince Talleyrand, in which he continued till his death in 1812. 'His compositions,' says the Harmonicon, 'which reach Op. 77, are unequal, because many of them were produced by contract, therefore adapted to the capacity and taste of the mob of players; but we know scarcely any composer of piano-forte music who has given to the world so many things that are both good and popular at the same time.'

DÜSSELDORF, a county or administrative circle in the Prussian Rhenish province of Juliers-Cleves-Berg, traversed from south to north by the Rhine, and bounded on the north by Holland, on the east by the circle of Münster and Arnsberg, on the south by Cologne, and on the west by Holland and the circle of Aachen or Aix-la-Chapelle. It has an area of about 2106 square miles, contains 13 minor circles and 58 towns, among which are Düsseldorf, Cleves (about 7100 inhabitants), Wesel (9950), Duisburg (5500), Emmerich (5760), Mühlheim (7000), Geldern (3600), Kempen (3250), Krefeld (19,300), Ratingen (3950), Barmen (25,100), Elberfeld (24,100), Lennep (4700), Burscheid (9960), Höhscheid (5300), Dorp (4900), Solingen (4550), Neuss (8100), and Viersen (3750). The present number of the inhabitants of Düsseldorf is about '22,500' in 1816 it was 587,278; 1821, 613,811; and 1831, 694,727. It is the most densely peopled portion of the Prussian dominions. About two-thirds of the inhabitants are Roman Catholics.

and one-third Protestants. The number of villages is 410, and of hamlets 805. The Rhine enters this county near Rheinfeld, divides it into two nearly equal portions, and after receiving a multitude of rivers and small streams, quits it near Schenkenschans, where it is 2300 feet in width. During its passage through Düsseldorf it is joined on the left bank by the Rft and Mörs, or Meurs, and on the right bank by the Wipper, Dühne, Düssel, Schwarzbach, Angerbach, Ruhr, Emsche, and Lippe. The northern part of the county is level, and though it contains large tracts of sand, it has also a considerable extent of good arable land and pastures. The soil of the other parts is highly productive in general, but there are many tracts in the mountainous districts, on the right bank of the Rhine, which are sterile, particularly in the circle of Lennep; and there are considerable woods and forests in and near those districts, to the extent of about 303,000 acres. The quantity of arable land is computed at 680,000 acres, and of meadows and pastures at 155,000 acres. There are extensive manufactures of woollen yarns and woollens, silks, cotton yarns and cottons, thread, leather, steel, iron, ironware and cutlery, tobacco, soap, &c. Iron, coals, and potters' clay, are among the native products. Grazing and the rearing of horses and cattle are actively pursued; the stocks in 1831 consisted of 34,973 horses, 154,313 horned beasts, and 77,032 sheep and goats.

DÜSSELDORF, a minor circle in the south of the preceding county or administrative circle, containing about 160 square miles and 64,600 inhabitants, with 4 towns, 37 villages, and 41 hamlets: it is bordered on the west by the Rhine, along which runs a range of small sand-hills; and is partly level and partly hilly. Its products are corn, potatoes, peas and beans, and much fruit; horned cattle, sheep, and swine are reared in great numbers. It is divided into 10 'Bürgermeistereien,' or townships, at the head of which is that of Düsseldorf (village of the Düssel), the capital of the whole county, formerly that of the duchy of Berg.

DÜSSELDORF, the capital, is situated in the centre of a fertile country on the right bank of the Rhine, at the point where the Düssel joins that river, in 50° 13' N. lat. and 6° 47' E. long., at an elevation of about 100 feet above the level of the sea. It was raised from the rank of a village ('villa') to that of a municipal town by Adolphus V., duke of Berg, in 1288: it was first united to the Prussian dominions with the duchy of Berg in 1815. The flying bridge across the Rhine dates from the year 1680. Düsseldorf having been carefully fortified, acquired the character of a fortress in the middle of the last century; but it was never tenable against a serious assault, and the defences were razed by virtue of the treaty of Luneville in 1802. It is one of the best-built towns on the Rhine, is surrounded by extensive garden-grounds, and consists of three quarters; namely, the Old Town on the right bank of the Düssel, which was the whole extent of the town until the beginning of the 17th century; the New Town on the Rhine; and Charles's Town (Carlstadt), the handsomest part of Düsseldorf, south of the Old Town and on the left bank of the Düssel, which takes its name from Charles Theodore, the elector-palatine, who founded it in 1786. There are 43 streets, several of which are constructed on a regular plan, particularly Frederic William's street which is planted with rows of trees, and five squares or open spaces, on one of which, the old market-place, stands an equestrian statue in bronze of John William, elector-palatine, of colossal dimensions but heavy execution, the work of Crepello. Among the buildings of note are the old palace, or rather one of its wings, (the only portion that escaped entire destruction during the bombardment of the town by the French in 1794), which has latterly been restored for the use of the Academy of Arts and the Royal Mint, and in the court-yard of which is another statue of John William by Crepello, in marble; adjacent thereto is the Picture Gallery, founded by that elector in 1710; but the 358 paintings it then contained were removed to Munich in 1808, and it now consists of 65 paintings, 263 sketches, 14,241 original drawings, 23,445 engravings, and 155 copper-plates. The other buildings of consequence are the present palace, where the governor or president of the county resides; the government-house, once a college of Jesuits; the observatory, town-hall (erected in 1567), courts of law, new barracks, theatre, public school or gymnasium, with about 320 pupils, a mint, and public library of about 30,000 volumes. Düsseldorf has seven churches, including two Protestant the most

remarkable are St. Lambert's, the high church, and the oldest in the town, which contains the sepulchres of several dukes of Berg, &c., and the church of the Jesuits, a handsome structure with two steeples, but overloaded with ornaments, beneath the main altar of which other sovereigns of Düsseldorf lie entombed. Besides these, there are a synagogue, three nunneries, an orphan and a lunatic asylum, two hospitals, and an infirmary, a polytechnic school, and a Protestant seminary for teachers, ten elementary schools, and ten schools for poor children, supported by the directors of the poor, a house of correction, an obstetrical institution, &c. The number of houses is about 1430; in 1791 it was 852; and in 1825, 1103. The population amounted to 8208 in 1775; 9541 in 1791; 12,102 in 1801; 14,100 in 1816; 18,724 in 1827; and 20,578 in 1831. The present population is about 21,000; and that of the whole township in 1834 was 31,109, of whom 25,833 were Roman Catholics. In 1833, the number of births was 1187, and of deaths 876. The marriages were in that year 260.

Düsseldorf is the seat of the provincial government, offices of revenue and taxes, and tribunals of justice, and possesses an academy of the fine arts and design with about 150 pupils, an architectural institute, an observatory, and several private collections in the fine arts, &c.; societies for the promotion of the useful arts, the improvement of prisons, &c., and a bible society, besides a variety of philanthropic associations. It has manufactories of woollens, cottons, leather, hats, tobacco, jewellery, mirrors, stockings, &c., and carries on a considerable trade in cotton, wool, wines and spirits, colonial produce, coals, timber, slates, and other commodities. It is a free port, and has a harbour for fifty vessels. Adjoining the town are the royal gardens, and a botanic garden.

DUTENS, LOUIS, was born at Tours, of a Protestant family, in 1730. After receiving his education in France, he came to England, and travelled with several noblemen in succession over the Continent, and also acted for a time as secretary to the English minister at the court of Turin. On his return to England he was presented to the living of Elsdon in Northumberland. He was made member of the Royal Society of London, and of the Académie des Inscriptions et Belles Lettres of Paris. Being well versed in antient and modern philology, and in archæology and numismatics, he wrote many works, the principal of which are:—1. *Recherches sur l'Origine des Découvertes attribuées aux Modernes, où l'on démontre que nos plus célèbres Philosophes ont puisé la plupart de leurs Connoissances dans les Ouvrages des Anciens, et que plusieurs vérités importantes sur la Religion ont été connues des Sages du Paganisme*, 8vo., Paris, 1766. This work went through several editions, revised by the author, to the last of which, 1812, he added his '*Recherches sur le tems le plus reculé de l'usage des Voûtes*,' which he had previously published separately. In his zeal to vindicate the often-overlooked claims of the antients to several discoveries which have been reproduced in modern times, Dutens oversteps at times the boundaries of sound criticism, and seems to wish to attribute almost every invention to the nations of antiquity. 2. '*Explication de quelques Médailles Grèques et Phéniciennes, avec une Paléographie Numismatique*,' 4to., 1776, to which are added several previously-written dissertations on numismatics. 3. '*Itinéraire des Routes les plus fréquentées de l'Europe*,' a work often reprinted. 4. '*Guide Moral, Physique, et Politique des Étrangers qui voyagent en Angleterre*.' 5. '*Appel au Bon Sens*,' a defence of Christianity against Voltaire and the Encyclopédistes. 6. '*Des Pierres précieuses et des Pierres fines, avec les Moyens de les connoître et de les évaluer*,' Paris, 1776. 7. '*Histoire de ce qui s'est passé pour l'établissement d'une Régence en Angleterre*,' 8vo., 1789. 8. '*Nouveaux Intérêts de l'Europe depuis la Révolution Française*,' 1798. 9. '*Considérations Théologiques sur les Moyens de réunir toutes les Eglises Chrétiennes*,' 8vo., 1798, a well meaning speculation towards a hopeless object. 10. '*Mémoires d'un Voyageur qui se repose*,' 3 vols., 8vo., Paris, 1806, which contain anecdotes of Dutens's life and travels. Dutens died in England in 1812.

DUUMVIRI, the name given to any magistrates in the republic of Rome who were elected in pairs for the discharge of any class of duties. The first duumvirate on record was composed of the two judges of blood (*duumviri perduellionis*), appointed by Tullus Hostilius for the trial of P. Horatius, a right of appeal to the people being allowed

to the accused (Liv. i. 26). This office was exercised by Tarquinius Superbus alone, for tyrannical purposes (Liv. i. 49), and afterwards by the consuls (Liv. ii. 5), who were indeed a *duumvirate*. The *Quæitores paricidii* were afterwards substituted for the consuls, and these were mentioned in the laws of the Twelve Tables (Pompon. l. ii. §. 23 D); but it seems that the *duumviri* were again entrusted with the administration of criminal law at the trial of Manlius Capitolinus (Gellius, xvii. 21); and they are mentioned as still existing even by Cicero (*Pro C. Rabirio*, c. iv. §. 12). The *duumviri sacrorum*, who took care of and interpreted the Sibylline Books, were also a very ancient magistracy (Liv. iv. 21). Niebuhr thinks (*Hist. of Rome*, i., p. 298, Engl. Tr.) that the number was dictated by a wish to deal evenly with the first two tribes, the Ramnes and the Tities. The chief magistrates in the municipia were also called *duumviri* (*Lips. Elect.*, i. 23), or sometimes consuls. (Cicero, in *Pisonem*, c. xi.) Their lictors generally carried little staves (*bacilla*) before them; but they occasionally arrogated to themselves the fasces. (Cicero, *Agrar.* ii. 34.) The *duumviri navales* were two officers, first elected in the year 436 A.U.C. (Liv. *Epit.* lib. xii.; Niebuhr's, *Römische Geschichte*, th. iii. p. 282). Their duty was to collect, equip, man, and command the fleets of the republic (Liv. ix. 30; xl. 18 and 26). There were also other *duumviri* created for special occasions.

DWARF is a technical term employed by gardeners to distinguish fruit-trees whose branches proceed from close to the ground from *riders* or standards whose original stocks are several feet in height.

DWARFING TREES. Nature, in many respects, can be made to deviate from her ordinary course of procedure, in order to be subservient to the purposes of men. In nothing is this fact more apparent than in the various modes of dwarfing trees.

The trees of our orchards and forests, for example, which grow naturally to a considerable size, can be made to assume all the appearances of maturity and age while only a few feet high; a forest in miniature can thus be created, which has a very grotesque and curious appearance. There are various methods of producing this effect; such as selecting peculiar kinds of stocks and grafting upon them. For example, if the pear-tree be grafted upon the quince stock, or the peach upon the plum, their growth is very much retarded, and their ultimate size is comparatively small: the same effect is produced upon all other trees where there is a difference between the tissue of the stock and that of the scion which has been grafted upon it; or if dwarf varieties be grafted upon stocks of a similar constitution, though taller in growth, the former will still retain their original character. Again, if the branches be bent, and the flow of the sap in any way impeded, or if a quantity of the fibrous roots be cut away, and nourishment more sparingly supplied to the branches, we arrive at the same results.

Sometimes trees are dwarfed by very severe pruning, particularly if this operation be performed in summer, and, although they evidently try for a length of time to overcome this obstruction to their natural size, yet they eventually assume a dwarfed and stunted habit, which, with a little care, may be retained for many years. The Chinese in particular have carried this practice to a great extent, and they ornament their fanciful gardens with miniature forests of elms, junipers, and other timber trees.

The methods of dwarfing employed by the Chinese are the following:—young trees of various sorts are planted in flat porcelain vessels, and receive only so much water as is sufficient to keep them alive; in a very short time the pots are completely filled with roots, which, being hemmed in on all sides, cannot obtain a sufficient quantity of nutriment, and, as a matter of course, the growth of the stem and branches is thus impeded. The Chinese also pinch off the ends from the young shoots, mutilate the roots, lacerate the bark, tie down the branches, and break many of them half through; in short, by every means in their power they contrive to check growth, so that, stunted and deformed by these means the trees soon assume all the marks of age when only two or three feet high.

There is another method of producing dwarf trees, which may be termed accidental: namely, selecting dwarf individuals and obtaining seed from them. It is well known that when the young seed is fertilized by the influence of the pollen belonging to its own flower, or to the same plant upon which it grows, the future progeny so produced par-

takes generally in a large degree of the nature of the parent from which it originates. Now, if seed be carefully obtained from a variety rather more dwarf than usual, some of the plants produced by that seed will be something dwarfer than their parents. The dwarfest individuals again selected for seed will originate a race yet dwarfer than themselves; and thus, with patience and by successive generations, a variety only a few inches high may be obtained from a species two or three feet high, or even higher. This is the origin of dwarf roses, sweet williams, dahlias, and other common cultivated flowers.

With the exception of this last-mentioned method, all the others, however different they may seem, proceed from the same principle; for whether we graft upon stocks whose tissue differs in organization from the scion, or whether we bend the branches, or cut or confine the roots, we prevent the full flow of the sap in all such cases, and thus advance the age of puberty and bring on a fruit-bearing state. When plants have arrived at this stage of existence, all their energies are directed to the formation of fruit; hence forcing a tree into an early state of fruit-bearing is almost synonymous with dwarfing it.

DWIGHT, TIMOTHY, an eminent American Presbyterian divine, was born at Northampton, in Massachusetts, May 14, 1752. From infancy he made rapid progress in general and scholastic learning; insomuch that, at the age of seventeen, very soon after taking the degree of B. A. at Yale College, Newhaven, he was appointed master of a grammar-school in that town, and, before he was twenty, one of the tutors of Yale College. He was licensed to preach in 1777, in which year, the sessions of the college having been stopped by the war of the Revolution, he offered his services as a chaplain in the American army. The death of his father in the following year rendered it desirable that he should return to Northampton, and the rest of his life was principally occupied in discharging the duties of tuition, first as master of a private seminary, next as president of Yale College, to which office he was appointed in 1795. He also held the professorship of theology. He died January 11, 1817.

His early life was extremely laborious: it is stated that while he kept school at Newhaven his time was regularly divided:—six hours of each day in school, eight hours in close and severe study, and the remaining ten hours in exercise and sleep. (Life, p. 20.) Over-exertion nearly brought on blindness: from the age of twenty-three he was continually subject to acute pain behind the eyes, and was unable, for the space of forty years, to read longer than fifteen minutes in the day. This makes the extent and variety of his knowledge, which was acquired almost entirely through the ear, the more remarkable; and the mastery which he acquired over his mental powers by discipline was so complete, that he could dictate two or three letters to different amanuenses at once, and he seldom forgot or found difficulty in producing any fact which was once stored in his memory. In 1774 he resorted to a severe system of abstinence in food and exercise, which had nearly proved fatal. He recovered a vigorous state of health, chiefly by returning to a daily course of strong exercise, and the benefit thus derived led him in after-life to devote his recreations regularly to a series of excursions, of which we have the fruits in his 'Travels in New England and New York,' 4 vols., 8vo., 1823. These contain a great quantity of information, statistical, topographical, and historical, which, considering Dr. Dwight's mental habits and opportunities, there is every reason to presume accurate: the statistics of course have long ceased to represent the present condition of the country. The historical parts, especially those relating to the Indian history, manners, and warfare, are of much interest. Dr. Dwight's chief work however is 'Theology explained and defended in a Series of Sermons,' 5 vols., 8vo. It is a course of 173 lectures, delivered by him as professor of divinity on the Sundays in term-time, so as to occupy about four years. His method of preaching was from very concise notes or heads, his eyes not permitting him to undergo the labour of writing; so that this voluminous body of divinity was not committed to paper till 1805, in which year he was provided with an amanuensis at the expense of the college.

Two more volumes of his sermons, fifty-nine in number, were published in 1827, and the editor intimates that he has more behind. These contain several addressed by him annually, according to college custom, as president, to the

candidates for the degree of B.A., which will be read with interest. Dr. Dwight is said to have been eminently a useful and effective as well as a learned preacher, and his life bore witness to the efficacy of his own belief. (*Life, prefixed to his 'Theology Explained.'*)

DWINA, the largest river that falls into the White Sea, and the seventh with regard to length in the Russian dominions, originates in the confluence of two smaller rivers, the Sukhoria and Yug, near Veliki-Usting, in 60° 46' N. lat., and 46° 30' E. long. The Sukhoria, a considerable stream, which flows out of Lake Goubinskii or Kuban, and runs in a very tortuous direction through the south-western parts of the government of Vologda, describes a course, along the whole of which it is navigable, of about 285 miles between that lake and the junction with the Yug. The Yug, flowing down from a morass on the northern range of the Volga mountains, at the southernmost point of the same government, and in the early part of its course washing the walls of Nikolsk in its progress northwards to its confluence with the Sukhoria, has a length of about 248 miles. These two rivers unite below Veliki-Usting and the river is thenceforward denominated the Dwina. The Dwina pursues in general a north-westerly direction through the western districts of the government of Vologda, becomes navigable before it quits them, traverses the south-western part of the government of Archangel, and discharges its waters through five arms below the town of Archangel into the bay of Dwinskaya, in the White Sea. Its length in a straight line from its source to its mouth is about 312 miles, but, including its windings, it is estimated at about 736 miles. It is navigable from the close of April to the first week in November for a distance of about 240 miles. It generally flows between high banks, and is on an average from 500 to 600 feet in width; at Archangel this width is increased to four miles. Soon after it has received the Pinega on its right bank, it forms a number of islands, which extend to its mouth. Its chief tributaries are, on its right bank, the Vouitshayda or Vitshayda, the source of which is on the declivity of the Vertshoturi range of the Ural mountains, not far from the sources of the Petshora: this river has numerous bends, and falls into the Dwina near Kershensko, in the centre of the government of Vologda, from which point the Dwina becomes navigable; and the Pinega, in the south-western part of the government of Archangel, which becomes navigable for a distance of about 70 miles from Pineg downwards, and after a course of about 190 miles, discharges its waters into the Dwina a little above the town of Kholmogory. On its left bank the Dwina receives the Vaga, which is navigable for about 75 miles, and joins the Dwina above Poinskoi, in the government of Archangel, and the Yama, a river navigable for about 90 miles, which has its confluence with the Dwina about 36 miles above Visk in the same government. The tides of the Dwina are perceptible nearly 30 miles above Archangel. The basin of the river occupies an area of about 123,900 square miles; the bed is generally of clay, covered with a thin layer of sand. It abounds in fish.

DYEING is the art of staining textile substances with permanent colours. To cover their surfaces with colouring matters removable by abrasion would be to apply a pigment rather than to communicate a dye. Dye-stuffs can penetrate the minute pores of vegetable and animal fibres only when presented to them in a state of solution, and they can constitute fast colours only by passing afterwards into the state of insoluble compounds. Dyeing thus appears to be altogether a chemical process, and to require for its due explanation and practice an acquaintance with the properties of the elementary bodies, and the laws which regulate their combinations. It is true that many operations of this, as of other chemical arts, have been practised from the most ancient times, long before any just views were entertained of the nature of the changes that took place. Mankind, equally in the rudest and most refined state, have always sought to gratify the love of distinction by staining their dress, sometimes even their skin, with gaudy colours. Moses speaks of raiment dyed blue, and purple, and scarlet, and of sheep-skins dyed red; circumstances which indicate no small degree of tinctorial skill. He enjoins purple stuffs for the works of the tabernacle and the vestments of the high priest.

In the article CALICO PRINTING, we have shown from Pliny that the ancient Egyptians cultivated that art with some degree of scientific precision, since they knew the use

P. C. No. 559.

of mordants, or of those substances which, though they may impart no colour themselves, yet enable white robes (*candida vela*) to absorb colouring drugs (*colorem sorbentibus medicamentis*). Tyre, however, was the nation of antiquity which made dyeing its chief occupation and the staple of its commerce. There is little doubt that purple, the sacred symbol of royal and sacerdotal dignity, was a colour discovered in that city, and that it contributed to its opulence and grandeur. Homer marks the value as well as antiquity of this dye, by describing his heroes as arrayed in purple robes. Purple habits are mentioned among the presents made to Gideon by the Israelites from the spoils of the kings of Midian.

The juice employed for communicating this dye was obtained from two different kinds of shell-fish, described by Pliny under the names of *purpura* and *buccinum*; and was extracted from a small vessel, or sac, in their throats to the amount of only one drop from each animal. A darker and inferior colour was also procured by crushing the whole substance of the *buccinum*. A certain quantity of the juice collected from a vast number of shells being treated with sea-salt, was allowed to ripen for three days; after which it was diluted with five times its bulk of water, kept at a moderate heat for six days more, occasionally skimmed to separate the animal membranes, and when thus clarified was applied directly as a dye to white wool, previously prepared for this purpose by the action of lime-water, or of a species of lichen called *fucus*. Two operations were requisite to communicate the finest Tyrian purple: the first consisted in plunging the wool into the juice of the *purpura*; the second, into that of the *buccinum*. Fifty drachms of wool required one hundred of the former liquor, and two hundred of the latter. Sometimes a preliminary tint was given with coccus, the kermes of the present day, and the cloth received merely a finish from the precious animal juice. The colours, though probably not nearly so brilliant as those producible by our cochineal, seem to have been very durable, for Plutarch says, in his *Life of Alexander*, (chap. 36), that the Greeks found in the treasury of the king of Persia a large quantity of purple cloth, which was as beautiful as at first, though it was 190 years old.*

The difficulty of collecting the purple juice, and the tedious complication of the dyeing process, made the purple wool of Tyre so expensive at Rome that in the time of Augustus a pound of it cost nearly 30*l.* of our money.† Notwithstanding this enormous price, such was the wealth accumulated in that capital, that many of its leading citizens decorated themselves in purple attire, till the emperors arrogated to themselves the privilege of wearing purple, and prohibited its use to every other person. This prohibition operated so much to discourage this curious art as eventually to occasion its extinction, first in the western and then in the eastern empire, where, however, it existed in certain imperial manufactories till the eleventh century.

Dyeing was little cultivated in ancient Greece; the people of Athens wore generally woollen dresses of the natural colour. But the Romans must have bestowed some pains upon this art. In the games of the circus parties were distinguished by colours. Four of these are described by Pliny, the green, the orange, the grey, and the white. The following ingredients were used by their dyers. A crude native alum mixed with copperas, copperas itself, blue vitriol, alkanet, lichen roccellus, or archil, broom, madder, woad, nut-galls, the seeds of pomegranate, and of an Egyptian acacia.

Gage, Cole, Plumier, Réaumur, and Duhamel have severally made researches concerning the colouring juices of shell-fish caught on various shores of the ocean, and have succeeded in forming a purple dye, but they found it much inferior to that furnished by other means. The juice of the *buccinum* is at first white; it becomes by exposure to air of a yellowish green bordering on blue; it afterwards reddens, and finally changes to a deep purple of considerable vivacity. These circumstances coincide with the minute description of the manner of catching the purple-dye

* Among other things, there was purple of Hermione (?) to the amount of five thousand talents. (Plutarch's *Lives*, translated by Langhorne, Wrangham's edition, vol. v., p. 240.) Horace celebrates the Laconian dye in the following lines:—

Nec Laconicas mlihi
Trahunt honestæ purpuras clientæ.

(Carm., lib. II., Ode 18.)

† Pliny says that a pound of the double-dipped Tyrian purple was sold in Rome for a hundred crowns.

shell-fish which we possess in the work of an eye-witness, Eudocia Macrembolitissa, daughter of the Emperor Constantine VIII., who lived in the eleventh century.

The moderns have obtained from the New World several dye-drugs unknown to the ancients; such as cochineal, quercitron, Brazil wood, logwood, annatto; and they have discovered the art of using indigo as a dye, which the Romans knew only as a pigment. But the vast superiority of our dyes over those of former times must be ascribed principally to the employment of pure alum and solution of tin as mordants, either alone or mixed with other bases; substances which give to our common dye-stuffs remarkable depth, durability, and lustre. Another improvement in dyeing of more recent date is the application to textile substances of metallic compounds, such as Prussian blue, chrome yellow, manganese brown, &c.

Indigo, the innoxious and beautiful product of an interesting tribe of tropical plants, which is adapted to form the most useful and substantial of all dyes, was actually denounced as a dangerous drug, and forbidden to be used, by our parliament in the reign of Queen Elizabeth. An act was passed authorizing searchers to burn both it and logwood in every dye-house where they could be found. This act remained in full force till the time of Charles II.; that is, for a great part of a century. A foreigner might have supposed that the legislators of England entertained such an affection for their native woad, with which their naked sires used to dye their skins in the old times, that they would allow no outlandish drug to come in competition with it. A most instructive book might be written illustrative of the evils inflicted upon arts, manufactures, and commerce, in consequence of the ignorance of the legislature.

Mr. Delaval made many ingenious experiments to prove that the particles of dye-stuffs possess no power of reflecting light, and that therefore when viewed upon a dark ground they all appear black, whatever colour they may exhibit when seen by light transmitted through them. He hence inferred that the difference of colour shown by dyed cloths is owing to the white light which is reflected from the textile fibres being decomposed in its passage through the superinduced colouring particles. We think it more than probable that this conclusion is in some respects incorrect, and that the aluminous, iron, and tin bases form combinations with dye-stuffs which are capable of reflecting light, independent of the reflection from the fibre itself. There can be no doubt however that this latter reflected light adds greatly to the brightness of the tints, and that the whiter the textile substance is the better dye it will, generally speaking, receive. It is for this reason that scouring or bleaching of the stuffs is usually prescribed as a process preliminary to dyeing.

Bergman appears to have been the first who referred to chemical affinities the phenomena of dyeing. Having plunged wool and silk into two separate vessels, containing solution of indigo in sulphuric acid diluted with a great deal of water, he observed that the wool abstracted much of the colouring matter, and took a deep blue tint, but that the silk was hardly changed. He ascribed this difference to the greater affinity subsisting between the particles of sulphate of indigo and wool, than between these and silk; and he showed that the affinity of the wool is sufficiently energetic to render the solution colourless by attracting the whole of the indigo, while that of the silk can separate only a little of it. He thence concluded that dyes owed both their permanence and their depth to the intensity of that attractive force.

We have therefore to consider in dyeing the play of affinities between the liquid medium in which the dye is dissolved and the fibrous substance to be dyed. When wool is plunged in a bath containing cochineal, tartar, and salt of tin, it readily assumes a beautiful scarlet hue, but when cotton is subjected to the same bath it receives only a feeble pink tinge. Dufay took a piece of cloth woven of woollen warp and cotton weft, and having exposed it to the fulking-mill in order that both kinds of fibres might receive the same treatment, he then subjected it to the scarlet dye; he found that the woollen threads became of a vivid red, while the cotton continued white. By studying these differences of affinity, and by varying the preparations and processes, with the same or different dye-stuffs, we may obtain an indefinite variety of colours of variable solidity and depth of shade.

Dye-stuffs, whether of vegetable or animal origin, though susceptible of solution in water, and, in this state, of penetrating the pores of fibrous bodies, seldom possess alone the power of fixing their particles so durably as to be capable of resisting the action of water, light, and air. For this purpose they require to be aided by another class of bodies, already alluded to, which bodies may not possess any colour in themselves, but serve in this case merely as a bond of union between the dye and the substance to be dyed. These bodies were supposed, in the infancy of the art, to seize the fibres by an agency analogous to that of the teeth of animals, and were hence called *mordants*, from the Latin verb *mordere*, to bite. However preposterous this comparison is now known to be, the term derived from it has gained such a footing in the language of the dyer that all writers upon his art are compelled to adopt it.

Mordants may be regarded, in general, as not only fixing but also occasionally modifying the dye, by forming with the colouring particles an insoluble compound, which is deposited within the textile fibres. Such dyes as are capable of passing from the soluble into the insoluble state, and of thus becoming permanent, without the addition of a mordant, have been called substantive, and all the others have been called adjective colours. Indigo and tannin are perhaps the only dyes of organic origin to which the title substantive can be applied, and even they probably are so altered by atmospheric oxygen, in their fixation upon stuffs, as to form no exception to the true theory of mordants.

Mordants are of primary importance in dyeing; they enable us to vary the colours almost indefinitely with the same dye, to increase their lustre, and to give them a durability which they otherwise could not possess. A mordant is not always a simple agent, but in the mixture of which it consists various compounds may be formed, so that the substances may not act directly, but through a series of transformations. The China blue process [CALICO PRINTING] affords a fine illustration of this truth. Sometimes the mordant is mixed with the colouring matters, sometimes it is applied by itself first of all to the stuff, and at others both these methods are conjoined. We may dye successively with liquors which contain different substances, which will act differently according to the different mordants successively employed. One solution will give up its base to the stuff only when aided by heat; another acts better and more uniformly when cold, though this is a rarer case.

When a mordant consists of a changeable metallic oxide, as of iron or tin, unless great nicety be used in its application, either no effect or an injurious one may be produced upon the dye. All these circumstances prove how necessary it is for the dyer to be thoroughly versed in chemical science. Each of the great dye-works in Alsace, celebrated for the beauty and fixity of their colours, is superintended in the laboratory department by a gentleman who has studied chemistry for two or more sessions in the universities of Paris or some other eminent schools. The numerous complaints which for some time back have been made in foreign markets of the fugitiveness of our calico, but especially of our cloth dyes, ought to rivet the attention of our great manufacturers and merchants on this important desideratum, and to lead them to supply it by consulting qualified persons as to the best means of improving this great branch of national industry.

The first principle of dyeing fast colours, we have seen, consists in causing the colouring matter to undergo such a change, when deposited upon the wool or other stuffs, as to become insoluble in the liquor of the dye-bath. The more powerfully it resists the action of other external agents, the more solid or durable is the dye. Generally speaking, a piece of well-dyed cloth should not be materially affected by hot water, by soap and water, by exposure to air and light, by dilute nitric acid, or even by very dilute aqueous chlorine.

In the following details concerning the art of dyeing we shall consider principally its application to wool and silk, having already treated, in the article CALICO PRINTING, of what is peculiar to cotton and linen.

The operations to which wool and silk are subjected preparatory to being dyed are intended, 1, to separate certain foreign matters from the animal fibre; 2, to render it more apt to unite with such colouring particles as the dyer wishes to fix upon it, as also to take therefrom a more lively and agreeable tint, as well as to be less liable to soil in use

The matters foreign to the fibre are either such as are naturally associated with it during its production by the animal, such as have been added to it in the spinning and weaving operations, or such as have been accidentally applied.

Silk is scoured by means of boiling in soap and water, whereby it is freed from a varnish improperly called gum. This consists of an azotized compound, which may be separated in a gelatinous form by cooling the hot water saturated with it. It constitutes about a fourth part of the weight of most raw silks, and contains a little colouring matter of an orange or yellow hue. When silk is required to be extremely white, either to be woven in that state, or to receive the brightest and purest dyes, it should be exposed to the action of humid sulphurous acid. [SULPHURATION.] For dark dyes, silk need not be scoured at all, in which case it preserves its whole weight. Wool is first washed in running water to separate its coarser impurities; it is then deprived of its *yolk* (a species of animal soap secreted from the skin of the sheep) either by the action of ammoniacal urine, by soap and water, or by a weak lye of carbonate of soda. Common wools lose in this way from 20 to 50 per cent. of their weight, and Merino wools still more. They receive their final bleaching by the fumes of burning sulphur, or by aqueous sulphurous acid.

Wools present remarkable differences in their aptitude for combining with dye-stuffs, which depend upon the different structure of the imbrications of the filaments. (Ure's *Philosophy of Manufactures*, p. 91.) The colouring particles seem to insinuate themselves at these pores with greater or less facility, and to be retained with greater or less force, according to the magnitude and form of the orifices. This difference in dyeing, therefore, is not due to the repulsive action of fatty matter, as has been commonly supposed, since it still exists in wool even when every particle of grease has been removed from it by alcohol and æther. A bran boil is often had recourse to, in order to make wool take the dye more readily and equally; but a hot lye containing one-half per cent. of crystallized carbonate of soda answers much better. When heated to the temperature of 140° or 150° Fahr., four parts of wool should be immersed in that liquor, and turned about for half an hour. The wool receives a faint yellowish tint from this bath, but it speedily becomes white on exposure to air, or it may be whitened at once by passing it through tepid water containing a very small quantity of muriatic acid. The yellow colour is most probably occasioned by the reaction of the sulphur and iron contained in the wool.

According to the experiments of Thenard and Roard, alum combines with wool in the state of a salt, without separation of its acid constituent. Wool boiled with a solution of tartar decomposes a portion of it completely; some of the acid and a little of the tartar combine with the wool, while a neutral tartrate of potash remains in the bath. This fact is interesting in reference to the scarlet dye, showing the important part which tartaric acid here performs.

Tinctorial colours are either simple or compound. The simple are black; brown, or dun; blue; yellow; and red; the compound are gray; purple; green; orange; and other numerous modifications, all producible by the mixture of simple colours. We shall treat here of only *black* and *brown*, to supply an omission in the previous part of the 'Cyclopædia.' The other dyes will be discussed in their alphabetical places.

Black.—If we apply to a white stuff blue, red, and yellow, in certain proportions, the resulting colour will be black. Proceeding on this principle, Father Castel asserted that 15 parts of blue, 5 of red, and 3 of yellow will produce a perfect black; but in making this statement he was influenced rather by theoretical than practical considerations. In fact he has afforded us no means of procuring these simple colours in an absolute state. It is undoubtedly true, however, that red, yellow, and blue, employed in adequate quantities, will produce black: because they will together absorb, or obstruct the passage of all coloured light, or, in other words, cause its total privation, whence blackness must result. If we suppose a piece of cloth, to which these three colours have been communicated, but not in such proportions as to produce a pure black, we shall have a tint corresponding to the colour that is in excess; as, for example, a blue, violet, red, or greenish *black*; and with paler tints we shall have a bluish, violet, red, or greenish *gray*.

Gall-nuts, and a salt of iron, so generally employed for the black dye, give merely a violet or greenish gray, and never a

pure black. The pyrolignite of iron, which contains a brown empyreumatic matter, occasions a brown inclining to greenish yellow in light shades, and to chestnut brown in dark hues. By galling cotton and silk, after a bath of pyrolignite of iron, and reiterating the processes several times, a tolerably pure black may be procured. Galls, logwood, and a salt of iron (copperas) produce merely a very deep violet blue; but if they be applied to wool in a hot bath, with frequent exposure to air, the logwood induces a brownness which is favourable to the formation of black.

The black dye for hats is communicated by logwood, copperas, and verdigris mixed in certain proportions in the same bath; from that mixture there results a vast quantity of an ochreous muddy precipitate, amounting to twenty-five per cent. of the copperas employed. This mud forms a deposit upon the hats which not only corrodes the fine beaver filaments, but causes both them and the felt to turn speedily of a rusty brown. A well-dyed black hat should retain its original tint as long as it lasts. There is no process in dyeing so defective as that of hats, or which stands so much in need of scientific amelioration. The hatter tries to wash away this ochreous mud by dilute sulphuric acid, and then counteracts the acid by a weak alkaline bath, thus introducing two adventitious evils as remedies for the first and main evil, which a very little chemical science could obviate.

Since gall-nuts give a blue precipitate with the peroxide salts of iron, they are occasionally replaced by sumach, bablah, &c.; but account should be taken in this substitution of the proportions of red or yellow colouring matter in these substances, relatively to the tannin which alone forms the blue precipitate. When a black of the best possible shade is to be given, the wool should be first grounded with indigo, then passed through a bath of logwood, sumach, and protosulphate of iron (green copperas). Sumach and nut-galls may also be employed in the proportion of 6 to 2½; or the sumach may be replaced by nut-galls, if they be equal to one-third of the sumach prescribed. A good black may be dyed upon an indigo ground with 100 pounds of wool, by taking 200 pounds of logwood, 60 pounds of sumach, 2½ pounds of galls, and 20 pounds of green copperas; and giving three heats of two hours each to the wool, with airings between. A good black, without an indigo blue ground, may be given to 100 pounds of wool, by boiling it in a bath of 25 pounds of alum and 674 of tartar; grounding it with weld and madder; then passing it through a bath of 200 pounds of logwood, 60 of sumach, and 2½ of galls; taking it out, adding to the bath 20 pounds of copperas; lastly, giving it three heats of two hours each time.

The best French black, according to Hellot, may be given to wool by first dyeing it a dark blue in the indigo vat, washing and fulling it; then for every 50 pounds, putting into the copper 8 pounds of bruised galls, and as much logwood tied up in a coarse canvas bag, and boiling them for twelve hours. One-third of the bath thus prepared is to be transferred into another copper with one pound of verdigris, and the wool or stuff is to be worked in this solution without intermission for two hours, the bath being kept hot, but not boiling. After taking out the stuff, another third part of the first bath is to be added along with four pounds of green copperas; the fire must be lowered while this salt is being dissolved, and the bath being refreshed with a little cold water, the stuff is to be worked through it for half an hour, and then aired. Lastly, the residuary third of the first bath is to be now introduced, taking care to squeeze the contents of the bag. From eight to ten pounds of sumach are added, the liquor is just made to boil, then refreshed with some cold water, after which a pound of green copperas being dissolved in it, the stuff is again passed through it for an hour. It is now taken out, aired, washed, then returned to the copper, and worked in the bath for another hour. It is next washed at the river and fullled. A finish is prescribed in the madder-bath.

The ordinary proportions used by the English black dyers for 100 pounds of cloth, previously treated in the indigo vat, are about 5 pounds of copperas, as much nut-galls bruised, and 30 pounds of logwood. They first gall the cloth, and then pass it through the decoction of logwood in which the copperas has been dissolved. A finish of weld is often given after fulling; but this is of doubtful utility, especially when a little soap has been used in the fulling-mill.

Vitalis prefers the pyrolignite of iron to the sulphate for

the black dye, and says it produces a softer and more velvety colour. We by no means join in this opinion, having found the pyrolignite apt to communicate a brown tint to the blue black, an effect producible also by using old copperas peroxidized by exposure to air.

The black dye vat, as it gets exhausted, is employed to dye greys of various shades.

Silk is dyed black in two methods, according to the market for which it is made. When sold by weight, as was formerly the practice at Tours, and is now with silk thread in this country, it is an object with the dyer to load it with as much colouring or other matter as possible. Sugar is at present much employed to falsify the weight of English silk thread, as any person may discover by applying a hank of it to his tongue. We have seen thread more than doubled in weight by this fraudulent device. Such silk is called *English black* by the French, who are not suffered to practise this deception. When silk is sold by superficial measure, on the other hand, it becomes the dyer's object to give it a black colour with as little weight of materials as possible. Hence the distinction well known in the trade of heavy and light silks.

The 25 per cent. of weight which silk has lost in scouring may be in a great measure recovered, by giving it a sufficient dose of galls. For this purpose a bath is made by boiling galls equal to two-thirds or three-fourths the weight of the silk for three or four hours in a sufficient quantity of water, and then letting the decoction settle for two hours. The silk must be steeped in this bath from twenty to thirty-six hours, and then washed in the river. The first galling is however commonly given with a bath somewhat spent; and for heavy blacks generally upon unscoured silk. Several successive immersions in gall-baths, and of considerable duration, are usually given to silk, with intervening washings and wringings at the peg.

The silk dyers keep up from year to year a black vat, often of very complex composition. The essential constituents of the vat are sulphate of iron and gum; but many vegetable matters, as well as flings of iron, are usually added. This bath being heated short of boiling, and then allowed to settle for about an hour, the silks are worked in it with much manipulation, occasional wringing out, airing, and re-dipping. As the copperas and gum get exhausted, the bath must be replenished with these ingredients in due proportions. The addition of logwood and verdigris is very useful to the black silk dye, and is now generally made. A ground of walnut peels is a good and cheap preparation for this dye.

We have entered into these theoretical and practical details concerning the black dye, as we conceive them likely to prove useful to our cloth manufacturers, many of whom have hitherto followed too much a blind routine. Every wearer of a black coat or trowsers is soon convinced to his cost that great improvements remain to be made in this department of dyeing.

II. *Brown or dun colour*.—This dye is not so common in this country as on the continent, where the colouring matter is generally produced at a very cheap rate by steeping ripe walnuts with their peels in water for a year or two till the vat acquires a deep brown colour and a fetid smell. This infusion affords very agreeable and permanent brown tints without any mordant, while it preserves the downy softness of the wool, and requires but a simple and economical process. In dyeing with this infusion, a quantity of it proportional to the shade required is to be put into the copper, diluted with water, and made to boil. The cloth or yarn needs merely to be moistened beforehand with tepid water, to be then plunged in the bath, and turned about till sufficiently dyed. Some dyers, however, give the stuff a preparatory mordant of alum, and leave it to drain for twenty-four hours before subjecting it to the bath of walnut-peels.

Sumach is usually employed in this country to dye fawns, and some browns; but more beautiful browns may be given to woollen stuffs by boiling them first with one-fourth their weight of alum and some tartar and copperas; washing, and afterwards dyeing them in a madder bath. The shade of colour depends upon the proportion which the copperas bears to the alum.

A good brown may also be obtained by mordanting every pound of the stuff with two ounces of alum and one ounce of common salt in a boiling bath; and then dyeing it in a bath of logwood to which some copperas has been added:

or the stuff dyed red in the madder bath may be turned about in the black dye vat till the required shade be hit.

The finest browns are produced by boiling each pound of the wool with two ounces of alum, dyeing it in a cochineal bath, and then transferring it into a bath containing a little cochineal darkened with acetate of iron. Instead of cochineal the archil or cudbear bath may be used with a little sumach or galls. This forms a cheaper but a more fugitive colour.

A beautiful brown tint, on wool or silk, may be had by first giving a pale blue shade in the indigo vat, then mordanting with alum, washing and finishing in a madder bath till the proper brown be brought up. The Saxon blue vat may also be used. If the stuff be mordanted with alum and tartar, then boiled in a madder bath, afterwards in one of weld or fustic, to which more or less copperas has been added, we shall have a mordore, cinnamon, or chestnut brown. By the combination of olive shades with red, bronze tints may be produced. For twenty-five pounds of stuff a bath containing four pounds of fustic will suffice. Boil the wood two hours, then turn the stuff in the bath for an hour, take it out, and drain. Add to the bath four or six ounces of copperas and a pound of madder or sandal wood; then work the stuff in it till the wished-for shade is attained.

Silk may receive a ground of annatto, and then be dyed in a bath of logwood or Brazil wood, whereby a fine brown tint is obtained.

Catechu is used for giving a bronze and brown to cotton goods. [CALICO-PRINTING.]

Blue colours are dyed with indigo, Prussian blue, and woad. Yellows with fustic, Persian berries, quercitron, turmeric, and weld. Reds, with archil or cudbear, Brazil wood, cochineal, kermes, lac, logwood, madder, safflower, or carthamus.

The purple, green, and orange dyes may be conveniently considered under the heads of SCARLET DYE, INDIGO, and QUERCITRON.

We shall conclude this article with a few practical remarks. M. Roard, long the skilful director of the Gobelins' dye-works, has observed that copper boilers exercise a considerable influence upon delicate dyes. He found that ammonia causes a blue precipitate in the alum bath made in such boilers, while it causes merely a white precipitate in the same bath made in vessels of glass, porcelain, and tin. When wool is kept for some hours in boiling-water contained in a copper vessel, it acquires a greenish gray tint: a result increased by the ordinary mixture of alum and tartar. If into this bath white wool be plunged, it receives a greenish yellow, or sometimes an ochrey hue.

These observations of M. Roard are of considerable importance, and should lead dyers to employ tin or at least brass boilers instead of copper ones for all vivid colours. Heating with steam, either by double vessels, by straight or spiral tubes, ought on all occasions to be preferred in the dye-house to naked fires, which seldom fail to carbonize some portions of the vegetable or animal matters, and thereby to degrade the colours. The top edge, or surface of the boilers should be about three feet and a half above the floor; this being a height which the workmen find most convenient for their manipulations when they stand upon a step 8 or 10 inches high.

The stuffs mordanted with alum should not be transferred to the bath immediately, but be allowed to drain and air for 24 hours. The colours are thereby rendered more lively than when dyed soon after the aluming. As experience has proved that an old alum bath is better than one fresh made, it should not be thrown away, but be strengthened or refreshed by the requisite additions of alum and tartar. It is certain that wools boiled in alum the second time, are more beautiful than those boiled in it the first time.

DYER, JOHN, born in 1700, was the second son of a respectable solicitor of Aberglasney in Caermarthenshire. He received his education at Westminster school, and when that was completed, began the study of the law. An early taste for poetry and painting led him to relinquish his legal pursuits, and he travelled about South Wales in the capacity of an itinerant painter. At this period he wrote his poem 'Grongar Hill,' which was published in 1727. Though he seems to have made but small proficiency in painting, he went to Italy to study, where he wrote the 'Ruins of Rome,' a descriptive poem, published in 1740. On his return to

England, having a small independence, he retired into the country, entered into holy orders, and married a lady named Ensor, said to be a descendant of Shakspeare. He died in 1758, shortly after the publication of his longer poem 'The Fleece,' having gradually improved his fortune.

'The Fleece' is a long unreadable poem, of a purely didactic kind. The middle of the last century was remarkably prolific in poems which took for their model Virgil's 'Georgics.' Dyer's 'Fleece,' Grainger's 'Sugar-cane,' and Phillips's 'Cyder,' are all of this class. By selecting subjects essentially unpoetical, whatever might be the ingenuity of the writers, they could do no more than make a tolerable poem of a bad kind; for they did not confine themselves to a mere outline of the subject, which they might fill up with what colouring they pleased, but essayed to give, in a poetical form, the intricacies and minutiae of various branches of manufacture. The selection of Virgil's 'Georgics' for a model was in itself a fallacy, as we question whether this work, with all its beauties, would be much read at the present time were it not for the opportunity which it affords of studying one of the most elegant writers of the Augustan age, and for the light it throws on the agriculture of the antients. The 'Ruins of Rome,' with here and there a fine line, seldom rises above mediocrity, and is a very heavy performance.

It is on the poem of his youth, 'Grongar Hill,' that Dyer's reputation depends. There is, perhaps, no depth of thought, no new idea in this work, but it is a most vivid and brilliant combination of pleasing images. The poet invokes the muse to 'draw the landskip bright and strong,' and the muse seems to grant his request. We may conceive the poem to be the work of a man walking up-hill, and struck with the succession of scenery which opens all around, he says the first thing that comes into his head; and as he is affected by none but beautiful prospects, what he says is sure to be pleasing. 'Grongar Hill' will always be a general favourite.

DYKE (in Geology), a fissure caused by the dislocation of strata, commonly also termed a fault. Dykes are of frequent occurrence, and often extend several miles, penetrating generally to an unknown depth. They must have been produced by some violent disturbances, and the amount of dislocation of necessity would vary in proportion to the intensity of the disturbing force. Accordingly there are many dykes of great width and extent, which materially affect the face of the country in which they occur, while there are others so slight that it requires much care and observation to ascertain their existence. The strata are in most cases uplifted on one side of the dyke much higher (varying many fathoms) than those on the other side, and produce an apparent irregularity of strata most perplexing to the geologist. Sometimes it happens that, without any irregularity of surface, two distinct strata appear to form a continuous line, as in the Black Down Hills in Devonshire. [**CRETACEOUS GROUP.**] In some cases, however, dislocation is found without any alteration of the *level* of the strata on either side, but the appearance of the strata immediately adjacent to the fault sometimes affords proof of the action of fire. [**COAL FIELDS.**] Dykes are of two distinct characters, depending upon the manner in which they have been filled up, and the substance of which they are composed. Dykes of the first description are those into which igneous rocks are supposed to have been injected in a state of fusion, and now appear as a consolidated mass. [**BASALT.**] In the second the fissures are filled with the debris, sometimes mixed with clay, of the dislocated strata through which they pass. In some cases the fissure has evidently remained unoccupied for a long period, and the filling up has proceeded gradually from the sides inwards. This is observed very evidently in the carboniferous limestones of England and Wales. Sometimes, in consequence of the great length of time intervening between the production of each coating of calcareous matter, the outside of each is covered with crystals, upon which the next layer has been formed. In the central portions of such fissures cavities are by no means uncommon.

DYLE. [**SCHLDEL.**]

DYNAMICS (*δύναμις*, force), a word of comparatively modern use, now universally adopted as signifying the science of matter in motion, as distinguished from *statics*, which relates to matter at rest. Under so general a term, our plan requires us simply to refer the reader to the several articles connected with the subject.
