Figs are vigorous, productive and long-lived trees, adapted to a wide range of soils. Their large leaves and luscious drooping fruit bring a subtropical flavor into temperate gardens. Figs bear two crops annually – the early, light crop, known as ‘breba’, and the later fall crop, known as figs, which tends to be a heavier crop. If you are in a marginal fig area (climates lacking a long, hot summer season) you need to encourage the early crop to ensure a harvest. This is done by 1) Selecting varieties with a heavy, early crop and 2) Pruning lightly or not at all in winter, the first crop of figs is borne on the previous season’s growth.

### Figs at a Glance

<b>Climate Zones:</b>	USDA zones 7-11, Sunset zones 4-9, 12-24; can be grown in zones 1-3, 10, 11 in
<b>Pollination:</b>	self-fertile
<b>Height:</b>	Can be kept to 10 feet by pruning or less by
